Gen. Ch. *Common calyx* imbricated, ſomewhat ſquarroſe, expanded, with oblong ſcales, broadiſh at the baſe, gaping in all directions at the tips. *Cor.* compound, radiated; *florets* of the diſk perfect, very numerous, cylindrical, ſhorter than the common calyx, ventricoſe, orbicular and depreſſed at the baſe, with a five-toothed, acute, ſpreading limb; thoſe of the radius female, fewer in number; much longer, ligulate, lanceolate, entire. *Stam.* (in the perfect florets,) Filaments five, curved, inſerted below the protuberance of the floret, as long as the tube; anthers cylindrical, tubular. *Piſt.* (in the perfect florets,) Germen oblong; ſtyle thread-ſhaped, the length of the floret; ſtigma cloven, reflexed: the female or ligulate florets differ in having the germen very ſmall, with neither ſtyle nor ſtigma. *Peric.* none; calyx unchanged. *Seeds* of the perfect florets ſolitary, oblong, obtuſe, quadrangular, compreſſed at the oppoſite angles, the inner ones narrower, crowned with two lanceolate, acute, deciduous ſcales: the ligulate florets form no ſeed. *Recept.* chaffy, large, ſmooth, its ſcales lanceolate, acute, deciduous, two of them ſeparating each ſeed.

Eſſ. Ch. Receptacle chaffy, flat, ſeed-crown of two-leaves. Calyx imbricated, ſomewhat ſquarroſe.

This ſtately genus conſiſts, in the laſt edition of Linnæus, of 13 ſpecies; Willdenow has 21. It is remarkable that they are all of American origin; nor is what Linnæus has been pleaſed to denominate *H. indicus*, an exception, for he received it merely as a cultivated plant from Egypt, and there is not the ſlighteſt reaſon to believe it any thing more than a variety of *H. annuus*, as he himſelf indicates.—Moſt of the *Helianthi* are perennial, herbaceous, with large, alternate, heart-ſhaped or ovate, ſtalked, roughiſh leaves, and copious, radiant, large, yellow or reddiſh, flowers.

H. *annuus*, the firſt that was diſcovered, and the largeſt ſpecies, may ſerve as a ſpecimen. This is a native of Mexico and Peru, where it greatly attracted the notice of the firſt European viſitors, who brought over ſeeds, and the plant being annual, it has ever ſince been preſerved in our gardens. The Society of Arts at London, ſome years ago, offered a premium for the raiſing of a certain quantity of the ſeeds of this Sunflower, to make ſallad-oil, and it was obtained by the late Rev. Henry Bryant, of Heydon, Norfolk, an eminent Engliſh botaniſt; but we know not that any one has adopted or purſued the ſcheme, and we have been informed by that gentleman, that even the ſeeds he raiſed lay idle in the apartments of the ſociety. One of the earlieſt figures of the Annual Sunflower may be ſeen in Gerarde's Herbal by Johnſon, 751, and one of the moſt magnificent in Miller's Illuſtration of the Linnæan Syſtem, t. 68. In its native country it is ſaid to grow to the height of 20 feet or more, and the flower to be two feet broad. This plant might well have authorized the poetical tale of Clytie, of which we ſhall ſay more under the article HELIOTROPIUM.

H. *multiflorus*, in a double ſtate, is the common perennial Sunflower of our gardens, with which all the parterres of Paris glow in the autumn.

H. *tuberoſus*, figured in Jacq. Hort. Vind. t. 161, is the Jeruſalem artichoke, ſo called, as we preſume, from the Italian name *Giraſole*, by which, it having been firſt raiſed in the Farneſe garden at Rome, it was originally diſtributed about Europe. (See Sm. Introd. to Botany 108.) It is a native of Peru, and is cultivated in kitchen gardens for the ſake of its tuberous roots, which are eatable when boiled, and have the flavour of the real Artichoke. But they ſoon pall the appetite, and as Mr. Goodyer obſerves in Gerarde ed. 2. 754, "which way ſoever they be dreſt and eaten, they ſtirre and cauſe a filthy loathſome winde within the body, and are a meat more fit for ſwine than men."

HELIANTHUS, in *Gardening*, comprifes plants of the flowery, herbaceous, hardy kinds; of which the ſpecies chiefly cultivated are, the annual ſunflower (H. annuus); the dwarf annual ſunflower (H. indicus); the perennial ſunflower

ſunflower (H. multiflorus); and the tuberous-rooted ſunflower (H. tuberoſus), or Jeruſalem artichoke.

The firſt of theſe ſpecies has varieties with double flowers, with deep yellow flowers, and with ſulphur-coloured flowers.

Method of Culture.—Theſe large flowery plants are all of them capable of being increaſed with great facility, either by the ſeeds, or parting the roots. The two firſt ſpecies are raiſed by the ſeeds, but the others by the diviſion of their roots.

The proper ſeaſon for ſowing the ſeeds is during the more early ſpring months, which ſhould be performed in a ſort of patches containing four or five ſeeds in each, in the clumps, borders, or other places where the plants are to ſtand for flowering.

As ſoon as the plants preſent themſelves, and are become of proper growth, they ſhould be thinned, ſo as to leave only one or two of the ſtrongeſt and beſt.

But in order to have the plants ready at a more early period, a little ſeed ſhould be ſown upon a moderate hot-bed, under glaſs frames, which, when the plants riſe and become ſufficiently ſtrong, and the weather ſuitable, ſhould be tranſplanted into the ſituations where they are intended to grow and flower. In reſpect to the divided roots they ſhould be planted out in the places where the plants are intended to grow, either in the autumn or early ſpring.

The decayed ſtems, and other parts, ſhould be regularly cleared away and removed, in all the perennial ſorts, as ſoon as they begin to decline. Theſe plants will continue a very great length of time.

The laſt ſpecies is commonly increaſed by planting out the ſmall roots, or pieces cut from ſuch as are of a larger ſize, and which have eyes or buds in them, pretty much in the ſame way as the potatoe, but allowing more diſtance every way. This may be done either in the autumnal or ſpring ſeaſon. The roots in this mode multiply rapidly. They ſhould be taken up for uſe, when the ſtems begin to decay in the autumn after they have been planted.

But when intended to be cultivated as a crop, the ſets ſhould be planted out in an open mellow part of the garden ground, in rows at three or more feet aſunder, and a foot and a half or two feet from ſet to ſet, having the depth of four or five inches.

The proper ſeaſon in this caſe is about the end of March, where the ſoil is of a light quality.

The roots may be taken up for uſe towards the end of September, and the whole ſecured in the following month. Where they are preſerved in ſand, in a properly dry place, they continue good moſt part of the winter.

All the plants that are raiſed by ſeed have a very conſpicuous ornamental effect, when placed backwards in the clumps, borders, and other compartments of large pleaſure grounds, and are capable, by being ſown at different times, of being kept in a ſucceſſion of flowering for a very great length of time.

The firſt ſpecies has lately been introduced into field culture in the view of the ſeeds, and the oil which is capable of being drawn from them, but we believe hitherto without any very great ſucceſs. See SUNFLOWER.

HELIAR, St., in *Geography*, a town of the iſland of Jerſey, ſituated on the eaſt ſide of the bay of St. Aubin, and deriving its name from Elerius, or Helier, a ſaint of this iſland, who was put to death by the Pagan Normans on their arrival hither. The town, which is well built and populous, lies at the eaſt end of a long and high rocky hill; and contains about 400 houſes, moſtly ſhops, near 2000 inhabitants, a handſome town-hall, and a ſpacious watering place. The market-houſe is large, encompaſſed with good houſes, among which is the court of juſtice, and at the top of it is a bronze gilt ſtatue of George II. The market, which is on Saturday, is much frequented. N. lat. 48° 38'. W. long. 2° 8'.

HELIASTES, in *Antiquity*, officers or magiſtrates of Athens, who conſtituted a court of five hundred perſons, called *Heliæa*, and were judges for taking cognizance of civil matters.

Ulpian gives us two etymologies of the word: ſome, ſays he, derive it from ἥλιος, *helios*, *ſun*; and hold it thus called, becauſe they ſat in the open air, in ſight of the ſun. Ulpian himſelf chooſes rather to derive *heliaſtes* from Ἡλιαία, *Heliæa*, the place where this court or council was held; and that from ἁλίζω, *I aſſemble*, of ἅλις, *ſatis*, *enough*.

The court of heliaſtes was one of the ſix civil juriſdictions of Athens, and that before which matters of the greateſt moment were uſually brought; ſo that it was held the firſt and moſt conſiderable of all the civil tribunals. The delinquencies of the military men were alſo brought before the heliaſtes.

This court conſiſted ſometimes of a thouſand, and ſometimes of fifteen hundred or more judges; in the former caſe the members of two other courts, and in the latter thoſe of three courts, were ſummoned by the Theſmothetæ, and before whom they took a ſolemn oath, which is preſerved by Demoſthenes in his oration againſt Timocrates: this court ſat from ſun-riſe to ſun-ſet.

HELICE, or ELICE, a name given by the ancient Greeks to the willow.

HELICE, Ἑλίκη, in *Aſtronomy*, the ſame with Urſa major.

HELICHRYSUM, in *Botany*. See ELICHRYSUM.

HELICIA owes its derivation to ἕλιξ, *a ſcrew*, from the ſpirally revolute form of its petals. Loureir. Cochinch. v. 1. 83.—Claſs and order, *Tetrandria Monogynia*.

Gen. Ch. *Cal.* Perianth inferior, in four ſmall, acute, erect ſegments. *Cor.* Petals four, linear, ſpirally revolute, ſlightly coaleſcing into a ſlender tube before the flower expands. *Stam.* Filaments four, thread-ſhaped, inſerted into the petals, above their middle; anthers linear, level with the top of the corolla. *Piſt.* Germen ovate, ſuperior; ſtyle thread-ſhaped, equal with the ſtamens; ſtigma oblong, cylindrical. *Peric.* Drupa ovate, ſmall, with a longitudinal furrow; kernel ſimple, ovate.

Eſſ. Ch. Calyx four-cleft, inferior. Corolla of four linear, revolute petals. Drupa ovate, with a furrow.

1. *H. cochinchinenſis*. Loureir. Native of woods in Cochinchina.—A *tree* of middling ſize, and furniſhed with ſpreading branches. *Leaves* ovate, pointed; ſome ſerrated, others entire. *Flowers* yellow, in ſimple, oblong, terminal bunches.

We are unable to refer this plant of Loureiro's to any of the Linnæan genera, either in the claſs *Tetrandria*, or to any of the tetrandrous variations in *Pentandria*, though from the deſcription it appears to be nearly allied to many of theſe, and may poſſibly be deſcribed under ſome other name.

HELICITES, in *Natural Hiſtory*, are foſſil remains of ſhells of the genus Conchyliolithus, of the family Turbinatæ Helicitæ, in the arrangement of the late Mr. William Martin, of which three ſpecies were diſcovered by that naturaliſt in the Derbyſhire ſtrata, and are figured and deſcribed in his "Petrificata Derbienſia;" *viz.*

1. *H. Auricularis*, or ear-like helicite, tab. 40. figs. 3, and 4: found in Bakewell, but is rather rare.

2. *H. Catillus*, or diſh-like helicite, one ſide flat, like an amorite, but not chambered, tab. 7. figs. 1 and 2: found in Tideſwell and in Winſter in limeſtone, and near Buxton in ſhale, theſe laſt being frequently flattened or compreſſed, ſometimes to the thickneſs of a ſhilling.

3. H. *Pufillus*, or petit helicite, a very ſmall ſhell, tab. 52. fig. 3.: found near Cheſterfield, in the cavities in a ſuppoſed capſule, or nut of ſome kind, included in the centre of an argillaceous ironſtone ball.

HELICOID PARABOLA, or the *parabolic ſpiral*, a curve ariſing upon a ſuppoſition of the axis of the common Apollonian parabola's being bent round into the periphery of a circle.

The helicoid parabola, then, is a line paſſing through the extremities of the ordinates, which converge towards the centre of the ſaid circle.

Suppoſe, *e. gr.* the axis of the common parabola to be bent into the periphery of the circle BDM, (ſee *Plate* X. *Analyſis, fig.* 1.) then the curve BFGNA, which paſſes through the extremities of the ordinates CF and DG, which converge towards the centre of the circle A, conſtitutes what we call the helicoid, or ſpiral parabola.

If the arch BC, as an abſciſs, be called x, and the part CF of the radius, as an ordinate to it, be called y, and the parameter of the parabola be called l, the nature of this curve will be expreſſed by the equation $lx = yy$.

HELICON, in *Ancient Geography*, the name of a mountain in Bœotia, near the gulf of Corinth, in the neighbourhood of Parnaſſus and Cytheron, ſacred to Apollo and the Muſes, who are thence called Heliconides. This hill was famous for the pureneſs of its air, the abundance of its waters, its fertile valleys, the coolneſs of its ſhades, and the beauty of the venerable trees which covered its ſummit. The nine muſes had their ſtatues in the wood of this mountain; and here were alſo ſtatues of Apollo and Mercury, of Bacchus by Lyſippus, of Orpheus of Thrace, and likewiſe of poets and celebrated muſicians. The fountain Hippocrene, that of Narciſſus, and a ſmall river named Permeſſus, flowed at the foot of this mountain, and here was alſo ſhewn the ſepulchre of Orpheus. It is ſituated in Livadia, and now called Zagura or Zaguya.—Alſo, a river of Greece, in Macedonia, which ran near Dium, and after having purſued a courſe of 65 ſtadia, ſunk under ground, and aſſumed the name of Baphyrus, according to Pauſanias, who adds, that it was navigable to the ſea.—Alſo, a river on the W. ſide of Sicily. Ptol.

HELICONIA, in *Botany*, from the famous mountain Ἑλικὼν, and ἑλικωνιάδες, *the Muſes*; the name having been given by Linnæus, evidently, as it appears to us, from an aſſociation of ideas with *Muſa*, a genus with which the preſent was originally confounded in his works. Linn. Mant. 147. Schreb. 158. Willd. Sp. Pl. v. 1. 1187. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 1. 284. Juſſ. 61. Lamarck. Dict. v. 1. 426. Illuſtr. t. 148. (Bihai; Plum. Gen. 50. t. 3.) Claſs and order, *Pentandria Monogynia*, or perhaps *Hexandria Monogynia*. Nat. Ord. *Muſæ*, Juſſ.—Linnæus refers it to his *Scitamineæ*, to which it is indeed nearly akin, but nearer to his *Coronariæ*.

Gen. Ch. *Cal.* Spathas, both general and partial, alternate, diſtinct. Perianth none. *Cor.* of one petal, ſuperior; tube very ſhort, cylindrical; limb in four oblong, erect, acute, channelled, nearly equal, ſegments, three of which are external, one internal. *Stam.* Filaments ſix, inſerted into the tube of the corolla; five of them equal, as long as the limb, thread-ſhaped, fertile; anthers vertical, erect, long and furrowed; in the place of the ſixth filament is a ſhort, channelled, curved, often notched, leaf or ſcale. *Pift.* Germen inferior, roundiſh, abrupt; ſtyle curved, about equal to the ſtamens; ſtigma obtuſe, notched. *Peric.* Capſule oblong, abrupt, triangular, of three cells and three valves. *Seeds* ſolitary, oblong, rugged.

Eſſ. Ch. Spathas both general and partial. Calyx none. Corolla in four deep ſegments, one of them internal. Barren filament like a ſcale. Capſule inferior, of three cells and three valves. Seeds ſolitary.

Obſ. What Linnæus terms a nectary of two leaves, appears to us on the one hand an internal petal, for which indeed the term nectary might, according to his cuſtom, be retained; and on the other, moſt undoubtedly, a barren or abortive filament, which, according to Adanſon, appears to be occaſionally perfect. In this reſpect the analogy with *Muſa* is very cloſe. We have corrected the generic characters accordingly. The ſpecies are involved in much confuſion; we ſhall attempt to define ſome of them from authentic materials.

1. H. *caribæa*. Lamarck. Dict. v. 1. 426. Willd. n. 1. (Bihai ampliſſimis foliis, florum vaſculis coccineis; Plum. Ic. 49. t. 59.)—Leaves rounded at both ends. Spathas imbricated. Inner ſegment of the corolla undivided.—Native of bogs in Guiana and the Caribee iſlands. This plant, according to Plumier's manuſcript quoted by Lamarck, has a thick, knotty *root*, and though 10 or 12 feet high, is herbaceous, deſtitute of a real *ſtem*. The *leaves* have long ſheathing *footſtalks*, their baſes enfolding one another ſo as to reſemble a ſtem about five feet tall, and as thick as a man's thigh, after which the ſtalks ſpread in two rows, and are rounded below, channelled above. The *leaf* itſelf is ſix or ſeven feet in length, and a foot and half wide, linear, entire, rounded at each end, flat, ſmooth, pliable, with one rib and numerous parallel tranſverſe veins, altogether reſembling the foliage of the *Muſa* or Plantain-tree. *Flower-ſtalk* radical, central, ſolitary, ſimple, about as tall as the footſtalks, bearing one large, upright, two-ranked ſpike, whoſe *ſpathas* are imbricated in two rows, boat-ſhaped, acute, compreſſed, red, containing abundance of crowded, greeniſh *flowers*. *Capſules* fleſhy, blueiſh.

Lamarck conſiders two other kinds mentioned by Plumier, one with blackiſh, the other with variegated, ſpathas, as varieties of this, but his opinion can neither be confirmed nor refuted till the plants are recovered.

2. H. *Bihai*. Linn. Mant. 211. Am. Acad. v. 8. 253. Willd n. 2. Swartz. Obſ. 96. t. 5. f. 2. H. luteo-fuſca; Jacq. Hort. Schoenbr. v. 1. 25. Muſa Bihai; Linn. Sp. Pl. 1447. Ballia; Merian. Surin. 54. t. 54.)—Leaves pointed at each end. Spathas diſtant. Stalk zigzag. Inner ſegment of the corolla three-cleft.—Native of South America, in mountainous boggy places. The Linnæan ſpecimens from Surinam, intended in the diſſertation called *Plantæ Surinamenſes*, ſo well agree with Merian's *Ballia*, that we cannot doubt their identity. This ſpecies has the ſize and habit of the laſt, but differs in having the *leaves* not rounded at the baſe or point; the common *flower-ſtalk* remarkably zigzag, ſomewhat hairy; the *ſpathas* diſtant, not imbricated, and according to Swartz, the inner ſegment of the *corolla* three-pointed.

The *H. Bihai* of Linn. Suppl. 157, is deſcribed from a flower of *Strelitzia reginæ*, and a leaf which we cannot with certainty determine to belong to it, though it poſſibly may be a narrow variety of that ſpecies.

3. H. *humilis*. Jacq. Hort. Schoenbr. v. 1. 23. t. 48, 49. Willd. n. 3. (Muſa humilis; Aubl. Guian. v. 2. 931.) —Leaves pointed at each end. Spathas rather diſtant. Flower-ſtalk nearly ſtraight. Inner ſegment of the corolla three-cleft; outer ones recurved.—Native of Guiana and Curaſſow. It flowered with Jacquin, in the Imperial garden at Schoenbrun, and, from his fine plates and full deſcription, appears to differ from the laſt in being a much lower plant, with leſs diſtant *ſpathas*, and a ſtraighter *flower-ſtalk*. The revolute or reflexed ſegments of the *corolla*, if conſtant, differ from what Swartz repreſents of the former.

4. *H.*

4. H. *pſittacorum*. Linn. Suppl. 158. Swartz. Obſ. 98. Andr. Repoſ. t. 124. Curt. Mag. t. 502.—Leaves taper-pointed, rounded at the baſe. Spathas few, upright. Flowers on ſmooth partial ſtalks. Corolla cloſed.—Native of Surinam and Jamaica. Sent to Linnæus under the name of *Palilia* by Allamand, whoſe ſpecimen, with ſeveral other authentic ones, is before us. The Dutch at Surinam call it *Papagoyen-beck*, or Parrot's-beak, whence the above ſpecific name. It has flowered in ſeveral ſtoves near London, and is very beautiful. The whole plant is ſeven or eight feet high, more ſlender, but more really caulefcent, than any of the foregoing. *Leaves* reſembling thoſe of a *Canna* or *Maranta*, about a foot long, elliptic-ovate, pointed, ſmooth, with fine tranſverſe veins or ribs. *Spathas* three or four, erect, or ſomewhat lax, lanceolate, diſtant, keeled, but not much compreſſed, of a fine orange hue. *Flowers* three or four from each general ſpatha, with ſcarcely any partial ones, on ſmooth ſtalks, near an inch long. *Corolla* near an inch and a half long, cloſed, curved, angular, orange, tipped with deep green or black. We ſee no reaſon to doubt Swartz's ſynonym, though Willdenow found ſome diſagreement between his deſcription and that of Linnæus, which we ſhall not ſtay to reconcile, having made ours from nature.

5. H. *hirſuta*. Linn. Suppl. 158.—Leaves pointed, ſpathas numerous, two-ranked, aſcending. Common flower-ſtalk zigzag, hairy, as well as the partial ones.—Sent to Linnæus by the celebrated Mutis, who gathered it in New Granada. This approaches to the ſize and habit of ſome of the former ſpecies. The *leaves* are ovate, pointed, ſmooth. *Common flower-ſtalk* zigzag, hairy. *Spathas* numerous, two-ranked, rather near to each other, but not imbricated, direct or a little aſcending, two inches long, broad and ſheathing at their baſe, more or leſs hairy, eſpecially their keel. *Flower-ſtalks* numerous from each, very hairy, from half an inch to an inch long, with no apparent partial ſpathas. *Germen* hairy, as is likewiſe the outſide of the *corolla*. The *petals* are ſtraight at the point. Of their colour we know nothing, except that they appear to have a dark ſtain like the laſt. Two of them ſeem to be broadeſt, hairy and external; two internal, oppoſite, narrower and ſmooth; ſo that perhaps the generic deſcription requires further amendment, which thoſe who can compare the different ſpecies alive, may perhaps ſupply. S.

HELICONII, in *Entomology*, the butterflies or papiliones in the Linnæan ſyſtem, that have the wings narrow, entire, uſually naked or ſemi-tranſparent, the upper ones oblong, the lower ſhort. Fabricius conſiders them nearly the ſame. According to this writer the anterior wings are oblong, the lower ones ſhort and rounded. See PAPILIO.

HELICTERES, in *Botany*, is derived from ἑλιξ, *a ſcrew*, becauſe its fruit is of a ſpiral ſhape. Linn. Gen. 468. Schreb. 290. Willd. Sp. Pl. v. 3. 720. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 313. Juſſ. 278. Lamarck Dict. v. 3. 86. Illuſtr. t. 735. Gærtn. t. 64. (Iſora; Plum. 24. t. 37.)—Claſs and order, *Decandria Monogynia*. Nat. Ord. *Columniferæ*, Linn. *Malvaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, tubular, half-ovate, ſpreading obliquely, unequally five-cleft, leathery. *Cor.* Petals five, oblong, equal in width, affixed to the receptacle, longer than the calyx; claws long, having a ſmall tooth on each ſide at the baſe; nectary of five, petal-ſhaped, lanceolate, very ſmall ſegments, covering the germen. *Stam.* Filaments five, ten, or more, very ſmall; anthers oblong, lateral. *Pift.* Receptacle thread-ſhaped, very long, recurved, having an ovate, ſuperior, germen at the top; ſtyle awl-ſhaped, longer than the germen; ſtigma moſtly five-cleft. *Peric.* Capſules five, often twiſted ſpirally, of one cell. *Seeds* numerous, angulated.

Obſ. This genus has been referred to the ſeveral claſſes of *Decandria*, *Dodecandria*, *Monadelphia*, and *Gynandria*, by different authors, but we are induced to place it in the firſt of theſe, from its having generally ten ſtamens perfectly diſtinct from each other above the receptacle.

Eſſ. Ch. Calyx tubular, inferior, obliquely five-cleft. Petals from five to ten. Germen on a very long ſtalk. Style ſomewhat five-cleft. Capſules five, ſpirally twiſted together, each of one cell, with many ſeeds.

1. *H. baruenſis*. Willd. Sp. Pl. v. 3. 720. Jacq. Amer. 236. t. 149.—"Leaves heart-ſhaped, deeply ſerrated, downy underneath. Fruit twiſted, the points ſtraight."—Native of woods near the ſea-ſide at Panama in South America.—*Calyx* cylindrical, with two lanceolate lips, the upper one biſid, the lower triſid. *Petals* five, linear.

2. *H. jamaicenſis*. Willd. Sp. Pl. v. 3. 720. Swartz. Ind. Occ. v. 2. 1156. Jacq. Amer. 235. t. 179. f. 99.—"Leaves heart-ſhaped, ſerrated, pubeſcent. Fruit ovate, acute, twiſted."—A maritime ſhrub growing in Jamaica.—*Flowers* terminal. *Calyx* bell-ſhaped, powdery or hairy, five-toothed. *Petals* five, unequal, oblong. *Fruit* like ropes twiſted together, about an inch in diameter.

3. *H. Iſora*. Linn. Sp. Pl. 1366. (*Pluk.* t. 245. f. 2.)—"Leaves elliptical, ſomewhat heart-ſhaped, with tooth-like ſerratures, pointed, rough, downy underneath. Flowers axillary. Fruit twiſted, awl-ſhaped at the top.—Found at Malabar, and in the Molucca iſlands.—*Leaves* ſmooth above, downy or hairy underneath. *Flowers* on foot-ſtalks, from two to four at every axillary point. *Calyx* tubular or club-ſhaped, lengthened out at the baſe, two-lipped at the margin. *Petals* five, unequal, obovate. *Fruit* twiſted, cylindrical, with a long, awl-ſhaped top.

4. *H. hirſuta*. Willd. Sp. Pl. v. 3. 721. Loureir. Cochinch. v. 2. 530.—"Leaves ovate, acute, ſerrated, ſomewhat heart-ſhaped, downy. Flower-ſtalks axillary, bearing many flowers. Fruit oblong, ſtraight, very hairy.—Native of woods on the plains of Cochinchina.—*Stem* ſhrubby, about ſix feet high, hairy. *Flower* dark purple. *Calyx* of one leaf, with a long, curved, hairy coloured tube. *Seeds* bony.

5. *H. undulata*. Loureir. Cochinch. v. 2. 531.—"Leaves lanceolate, waved. Flowers in a bunch. Capſules five, ſtellated.—Native of the woods of Cochinchina. This is a middling ſized tree, with ſpreading branches. *Leaves* entire, ſmooth, alternate. *Flower* ſmall, reddiſh-green, generally terminal. *Capſules* ſcarlet, horizontally arranged in the form of a ſtar. *Seeds* ovate, ſmooth, brown, fleſhy.

6. *H. paniculata*. Loureir. Cochinch. v. 2. 531.—"Leaves ovate, acute. Flower paniculed. Stamens numerous.. Capſules five, ſtellated. This, as well as the laſt ſpecies, grows in the woods of Cochinchina. They are both taken up from Loureiro's deſcriptions. The preſent is a large *tree*, with ſpreading branches. *Flower* reddiſh. *Panicles* lax, moſtly terminal. *Capſules* red, of two valves, many-ſeeded, radiating into a circle. *Anthers* above 20, adhering to the ſides of the germen.

7. *H. anguſtifolia*. Linn. Sp. Pl. 1366. Oſb. itin. 232. t. 5.—"Leaves lanceolate, entire. Fruit ovate, ſtraight."—Native of Canton in China.—*Stem* ſhrubby, about five feet high, erect, branching. *Leaves* plain on the upper ſide, veined at the back, downy. *Flowers* pale purple. *Seeds* numerous, angulated.

8. *H. pentandra*. Linn. Mant. 294. Willd. Sp. Pl. v. 3. 722.—"Stamens five. Leaves ovate; thoſe about the flowers dark purpliſh."—Native of Surinam.—*Leaves* alternate,

nate, pointed, ferrated. *Calyx* with branched briſtles. *Capſules* twiſted, woolly.

9. *H. carthaginenſis.* Linn. Sp. Pl. 1366. Jacq. Amer. 237. t. 150.—"Leaves heart-ſhaped, ferrated. Fruit oblong, ſtraight."—Found in the woods of Carthagena, flowering in June and July.—This ſhrub is 12 feet high, erect.—*Leaves* downy on both ſides. *Flowers* very fœtid, coming occaſionally before the leaves, but generally at the ſame time with them. *Calyx* browniſh yellow. *Petals* purple. In habit it is nearly allied to *H. baruenſis*, but differs both in flower and fruit.

10. *H. apetala.* Linn. Sp. Pl. 1366. Jacq. Amer. 238. t. 181.—"Leaves five-lobed, divaricated. Flowers apetalous."—Native of woods in Carthagena.—This beautiful tree riſes to the height of 40 feet, with a large elegant head. *Leaves* folded, five-lobed half way down, ſmooth on the upper ſide, ſomewhat woolly beneath; lobes ovate-roundiſh, acute, entire. *Flowers* panicled, numerous, dirty yellow with purple ſpots. The inhabitants call this ſpecies *Camajonduro.*

HELICTERES, in *Gardening*, contains plants of the ſhrubby exotic kind, which require the heat of the ſtove; and of which the ſpecies chiefly cultivated are, the ſmall-fruited ſcrew-tree (H. baruenſis); and the great-fruited ſcrew-tree (H. iſora).

Method of Culture.—The increaſe in plants of this deſcription is moſtly accompliſhed by means of the well-ripened ſeed, which ſhould be ſown upon a hot-bed protected by glaſſes in the ſpring ſeaſon, and when the plants appear and are become of ſufficient ſtrength, they ſhould be removed ſeparately into ſmall pots filled with light mould, and plunged into a moderate hot-bed of tan, ſhade from the ſun being carefully given until they have ſtricken freſh root. In the after part of their management they are to be treated in the ſame manner as other tender ſhrubs, the glaſs frames being daily raiſed according to the ſtate of the weather, in order that they may have a proper ſupply of freſh air. During the ſummer ſeaſon the plants ſhould continue under the frames, provided there be ſufficient height; when in autumn they ſhould be again plunged in the tan bed of the ſtove, where they ſhould conſtantly remain; care being taken to ſhift them into larger pots as they ſtand in need of it, and not too much water be given them in the winter. While the hot ſummer weather continues they ſhould, however, be well ſupplied with air as well as water.

Plants of this kind afford curioſity and ornament among collections of other plants of the ſtove kind.

HELIGOLAND, HELGOLAND, or *Heilgaland*, in *Geography*, a Daniſh iſland in the North ſea, nearly oppoſite to the mouth of the Elbe; about nine miles in circumference. This iſland has been very much ſubject to inundations, and a conſiderable part of it has been deſtroyed, particularly in 1649. It is divided, however, into "Klif" and "Dubnen," or high and low land. It produces barley and corn, but not enough for the inhabitants, who chiefly ſubſiſt by fiſhing. The uplands afford paſture for about 60 cows and as many ſheep. On the higheſt part of the weſt klif the Hamburghers have erected a light-houſe or beacon. Since the year 1727 the downs have been ſeparated from the reſt of the iſland by a channel ſufficiently deep for veſſels of a ſmall ſize. The number of inhabitants is about 2000, who are deſcendants of the ancient Friſians, and who have their own particular manners and laws. They are ſkilful pilots, and are much employed in conducting ſhips up the Elbe, the Weſer, and the Eider. In 1714 it was annexed to the crown of Denmark. In the year 1807 this iſland was ſeized by the Britiſh. N. lat. 54° 12'. E. long. 8° 24'.

HELIOCARPUS, in *Botany*, is derived from ἥλιος, the *ſun*, and καρπος, a *fruit*, becauſe the fruit of this plant is radiated like the ſun, or rather as artiſts are accuſtomed to repreſent that body. This idea of its derivation is thus expreſſed by Linnæus in his *Critica Botanica*, p. 97. "Who has ever ſeen the roundiſh fruit of a plant encircled longitudinally at the margin with compound rays, without figuring to himſelf the ſun as it is uſually depicted? This idea once combined with the word *Heliocarpus* is ſo connected with it, that the plant, or rather its name, never occurs without calling to mind the idea above expreſſed."—Linn. Gen. 241. Schreb. 325. Willd. Sp. Pl. v. 2. 874. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 129. Juſſ. 290. Lamarck Dict. v. 3. 89. Illuſtr. t. 409. Gærtn. t. 49.—Claſs and order, *Dodecandria Digynia.* Nat. Ord. *Columniferæ*, Linn. *Tiliaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of four leaves, coloured; leaflets linear, long, broadiſh, ſpreading, deciduous. *Cor.* Petals four, linear, much ſhorter than the calyx, narrowiſh. *Stam.* Filaments 16, awl-ſhaped, almoſt as long as the calyx; anthers twin, linear, incumbent. *Piſt.* Germen roundiſh; ſtyles two, ſimple, erect, as long as the ſtamens; ſtigmas acute, diſtant. *Peric.* Capſule turbinate-ovate, peduculated, compreſſed, ſurrounded longitudinally on both ſides with rays pinnately branched, of two cells and two valves, with the partition contrary. *Seeds* ſolitary, ſomewhat ovate.

Eſſ. Ch. Calyx four-leaved. Petals four. Styles ſimple. Capſule of two cells, compreſſed, longitudinally radiated all round.

1. *H. americana.* Linn. Sp. Pl. 643. Hort. Cliff. t. 16. Trew. Ehret. t. 45. This is the only ſpecies known; a native of the warmer parts of America, flowering in December, and appears to have been the *Montia* of Dr. Houſton, which was introduced by him into the gardens at Kew before 1733, though now long ſince loſt.—This plant, which requires to be kept in a ſtove, riſes to the height of 15 or 18 feet, ſending out many lateral *branches* towards its top. *Stem* erect, round, ſmoothiſh, marked with white dots. *Leaves* heart-ſhaped, pointed, unequally ſerrated, ribbed, ſomewhat harſh on each ſide. *Stipulas* awl-ſhaped, ſmooth, bent back and ſpreading, deciduous, ſhort. *Flowers* white, in bunches. *Capſule* ſurrounded with feathery, cloven rays. This genus is nearly akin to *Triumfetta*, though ſufficiently diſtinct from that plant. It is ornamental, but difficult of culture.

HELIOCENTRIC PLACE *of a Planet*, is the place wherein the planet would appear to be if viewed from the centre of the ſun, or the point of the ecliptic, wherein a planet viewed from the ſun would appear to be.

The word is compounded of ἥλιος, *ſun*, and κέντρον, *centre*. The heliocentric place, therefore, coincides with the longitude of a planet viewed from the ſun. See PLACE.

HELIOCENTRIC *latitude of a planet*, is the inclination of the line drawn between the centre of the ſun and the centre of a planet to the plane of the ecliptic.

The heliocentric latitude of a planet is thus determined: if the circle K D M (ſee *Pl.* XVI. *Aſtron. fig.* 139.) repreſent the orbit of the earth round the ſun, and the inner one A N B *n*, be placed ſo as to be inclined to the plane of the other (for which reaſon it appears in the form of an ellipſis), when the planet is in N or *n* (which points are called its nodes), it will appear in the ecliptic, and ſo have no latitude; if it move to P, then, being ſeen from the ſun, it will appear to decline from the ecliptic, or to have a latitude; and the inclination of the line R P to the plane of the ecliptic, is called the planet's heliocentric latitude; and the meaſure of it is

the angle P R *q*, ſuppoſing the line P *q* to be perpendicular to the plane of the ecliptic.

This heliocentric latitude will be continually increaſing, till it come to the point A, which they call the limit of utmoſt extent of it; and then it will decreaſe again, till it come to nothing in N; after which it will increaſe again till it come to B; and laſtly, it will be decreaſing again, till the planet comes to be in *n*, &c.

HELIOCENTROS, in *Natural Hiſtory*, a name given to an inſect of the poiſonous kind, called by Ariſtotle, Phalangium decticum, and by the Latins Solipuga.

HELIOCOMETES, *comet of the ſun*, a phenomenon ſometimes obſerved at the ſetting of the ſun; thus denominated by Sturmius and Pylen, who had ſeen it, becauſe it ſeems to make a comet of the ſun, being a large tail, or column of light, fixed or hung to that luminary, and dragging after it at its ſetting, much in the manner of a tail of a comet.

In that obſerved by M. Pylen, at Grypſwald, March 15, 1702, at five o'clock in the afternoon, the end which touched the ſun was only half the ſun's diameter broad, but the other end, oppoſite to the ſun, was much broader; its length was above ten diameters of the ſun, and it moved in the ſame tract as the ſun; its colour was yellow next the ſun, and darker farther off; it was only ſeen painted on the thinner higher clouds; a little teleſcope eaſily diſcovered, that there was nothing of it on the thicker and lower clouds, though the naked eye could not diſcover ſo much. It laſted in its full vigour the ſpace of an hour, and then gradually diminiſhed.

HELIODORUS, in *Biography*, born at Emeſſa, in Phœnicia, flouriſhed under the emperors Theodoſius and Arcadius, at the cloſe of the fourth century. In his youth he compoſed a romance entitled Æthiopia, and relating the loves of Theagenes and Chariclea, which is ſaid to be a very ingenious and pleaſant compoſition, and has ſerved as a model for ſubſequent works of a ſimilar kind. This was firſt printed at Baſil in 1534; the copy from which it was taken having been ſaved by a common ſoldier at the ſack of Buda. It was tranſlated by a Poliſh knight, and an edition of it, with the learned notes of Bourdelot, was printed at Paris in 1619. The author was afterwards raiſed to the dignity of a biſhop of Tricca in Theſſaly. It has been ſaid that a ſynod, having put it to his choice whether he would burn his romance or renounce his biſhopric, he preferred the latter, and was in conſequence depoſed. This fact is ſtated, as the current report, by Bayle, who gave no credit to it himſelf. Moreri. Bayle.

HELIODORUS of Lariſſa, a Greek mathematician, who flouriſhed ſoon after the reign of Tiberius, was author of a treatiſe on Optics, of which a fragment only was publiſhed at Florence, in Greek and Latin, in 1573, and an Italian tranſlation of the ſame by Ignatius Danti, with his edition of Euclid's Optics. The moſt complete edition of the Optics of Heliodorus was publiſhed at Paris, in Greek and Latin, with notes by Bartholin. He is ſuppoſed to have written a treatiſe on weights and meaſures, which was found among the MSS. of Iſaac Voſſius. Gen. Biog.

HELIOGABALUS, a Roman emperor, was ſon of Varius Marcellus, and called Heliogabalus becauſe he had been prieſt of the ſun in Phœnicia. The beauty of his perſon, his imperial connections, and a report circulated by his relations that he was in fact the natural ſon of Caracalla, ſo ingratiated him with the ſoldiers quartered at Emeſſa, that they were induced, by profuſe largeſſes, to proclaim him emperor. This event happened, according to Gibbon, on the 16th of May 218, when he was only about 15 years of age, or at moſt 17. He now aſſumed, as he afterwards polluted, the dignified name of Antonius; and, to win the favour and ſupport of the army, he pretended to have taken up arms to revenge the death of his father, and the oppreſſions of the military order. His ſucceſſion to the high honour of emperor was oppoſed by Macrinus, who was defeated in battle, driven to flight, and afterwards ſlain. The ſpecious letters in which the young conqueror announced his victory to the ſenate, were filled with profeſſions of virtue and moderation. He declared that the ſhining virtues of Marcus and Auguſtus ſhould ever be conſidered as the guides of his life, and the rules of his adminiſtration. He affected to dwell with a ſort of pride on the ſtriking reſemblance of his own age and fortunes with thoſe of Auguſtus, who in his earlieſt youth had revenged, by a ſucceſsful war, the murder of his father. The commencement of his reign was ſtained with numerous executions of the friends and ſervants of Macrinus; and at Nicomedia he ſlew, with his own hand, Gannys, his preceptor, to whoſe exertions he had been principally indebted for his victory. He now ſhewed his character in its true light, and in a very ſhort time the moſt luxurious effeminacy was united to ſavage ferocity, and his garb and equipage were thoſe of an eaſtern deſpot. He brought the image of the deity, whoſe prieſt he had been, to Rome, and placed it, which was only a block of ſtone, in a temple, on mount Palatine, which he had made the centre of all that was ſacred in the ſtate of religion. He next procured for his idol, the goddeſs Aſtarte or the moon, as a conſort, from Carthage, and ſignalized his mad idolatry by every extravagance which human ingenuity and deſperate licentiouſneſs could deviſe. He made his grandmother Mæſa, and his mother Sæmias, his colleagues on the imperial throne, and choſe a ſenate of women, over which his mother preſided, and preſcribed all the modes and faſhions which prevailed in his empire. Heliogabalus ſeemed to have no other ambition than to ſurpaſs, in folly and debauchery, the very worſt of his predeceſſors. Corrupted by his youth, his country, and his fortune, he abandoned himſelf to the groſſeſt pleaſures with ungoverned fury, and ſoon found diſguſt and ſatiety in the midſt of his enjoyments. A capricious prodigality ſupplied the want of taſte and elegance. He confounded the order of ſeaſons and climates to ſport with the paſſions and prejudices of his ſubjects, and he ſubverted every law of nature and decency. A long train of concubines, and a rapid ſucceſſion of wives, were inſufficient to ſatisfy the impotence of his paſſions. He affected to copy the dreſs and manners of the female ſex, preferred the diſtaff to the ſceptre, and diſhonoured the dignities of the empire by diſtributing them among his numerous lovers, one of whom was publicly inveſted with the title and authority of the emperor's, or, as he ſtyled himſelf, of the empreſs's huſband. His favourites were ſelected from men of the loweſt rank and moſt infamous character. At length all orders of the ſtate were amazed at their own tameneſs, folly, and diſgrace, in ſubmitting to ſo vile a maſter. Even the ſoldiers, who cheriſhed the memory of Caracalla, could not endure the infamy of his ſucceſſor. Heliogabalus was induced by his grandmother to adopt his couſin, Alexander, as his ſucceſſor, whoſe morals the emperor would gladly have corrupted, as a ſort of ſereen for his own conduct; and when he found himſelf unable to do this, he plotted his deſtruction. His plan did not ſucceed. The Prætorian guards ſwore to protect Alexander, and, in their fury, to revenge the diſhonoured and polluted majeſty of the throne. Heliogabalus was murdered by his own ſoldiers, his mutilated corpſe dragged through the ſtreets of the city, and thrown into the Tyber. His memory was branded with eternal infamy by the ſenate, the juſtice of whoſe decree has been

ratified by poſterity. This event happened in the year 222, after a reign of three years and three quarters. Gibbon.

HELIOMETER, formed of ἥλιος, *ſun*, and μέτρω, *I meaſure*, the name of an inſtrument called alſo *aſtrometer*, invented by M. Bouguer in 1747, for meaſuring with particular exactneſs the diameters of the ſtars, and eſpecially thoſe of the ſun and moon.

This inſtrument is a kind of teleſcope, conſiſting of two object-glaſſes, of equal focal diſtance, placed one of them by the ſide of the other, ſo that the ſame eye-glaſs ſerves for both. The tube of this inſtrument is of a conic form, larger at the upper end, which receives the two object-glaſſes, than at the lower, which is furniſhed with an eye glaſs and micrometer. By the conſtruction of this inſtrument, two diſtinct images of an object are formed in the focus of the eye-glaſs, whoſe diſtance, depending on that of the two object-glaſſes from one another, may be meaſured with great accuracy: nor is it neceſſary that the whole diſk of the ſun or moon come within the field of view, ſince, if the images of only a ſmall part of the diſk be formed by each object-glaſs, the whole diameter may be eaſily computed, by their poſition with reſpect to one another: for, if the object be large, the images will approach, or perhaps lie even over one another; and the object-glaſſes being moveable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known diſtance of the centres of the two glaſſes; beſides, as this inſtrument has a common micrometer in the focus of the eye-glaſs, when the two images of the ſun or moon are made in part to cover one another, that part which is common to both the images may be meaſured with great exactneſs, as being viewed upon a ground that is only one half leſs luminous than itſelf; whereas, in general, the heavenly bodies are viewed upon a dark ground, and, on that account, are imagined to be larger than they really are. By a ſmall addition to this inſtrument, provided it be of a moderate length, M. Bouguer thought it very poſſible to meaſure angles of three or four degrees, which is of particular conſequence in taking the diſtance of ſtars from the moon. With this inſtrument M. Bouguer, by repeated obſervation, found, that the ſun's vertical diameter, though ſomewhat diminiſhed by the aſtronomical refraction, is longer than the horizontal diameter; and, in aſcertaining this phenomenon, he alſo found, that the upper and lower edges of the ſun's diſk are not ſo equally defined as the other parts; on this account his image appears ſomewhat extended in the vertical direction. This is owing to the decompoſition of light, which is known to conſiſt of rays differently refrangible in its paſſage through our atmoſphere. Thus, the blue and violet rays, which proceed from the upper part of the diſk at the ſame time with thoſe of other colours, are ſomewhat more refracted than the others, and, therefore, ſeem to us to have proceeded from a higher point; whereas, on the contrary, the red rays proceeding from the lower edge of the diſk, being leſs refracted than the others, ſeem to proceed from a lower point; ſo that the vertical diameter is extended, or appears longer than the horizontal diameter. Mem. Acad. Sc. Par. 1748.

Mr. Servington Savery diſcovered a ſimilar method of improving the micrometer, which was communicated to the Royal Society in 1743. See MICROMETER.

HELIOPHILA, in *Botany*, from ἥλιος, *the ſun*, and φίλος, *a friend*, becauſe this genus thrives more particularly in the ſun-ſhine. It was ſo named by profeſſor Burmann, who has deſcribed it in the Tranſactions of the Royal Society at Upſal.—Linn. Gen. 340. Schreb. 443. Willd. Sp. Pl. v. 3. 527. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 397. Juſſ. 238. Lamarck Dict. v. 3. 90. Illuſtr. t. 563: (Chamira; Thunb. Nov. Gen 48.)—Claſs and order, *Tetradynamia Siliquoſa*. Nat. Ord. *Siliquoſæ*, Linn. *Cruciferæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of four ſpreading leaves, oblong, concave, membranaceous at the margin, deciduous; the two exterior ones veſiculated at the baſe. *Cor.* of four cruciform petals, which are roundiſh, flat and ſeſſile; nectaries two from the receptacle, recurved towards the veſicle of the calyx. *Stam.* Filaments ſix, awl-ſhaped, erect, as long as the calyx, two oppoſite a little ſhorter; anthers oblong, erect. *Piſt.* Germen ſuperior, cylindrical; ſtyle ſhorter than the germen; ſtigma obtuſe. *Peric.* Pod round, ſomewhat toruloſe, pointed, of two cells and two valves. *Seeds* many.

Eſſ. Ch. Nectaries two, bent back towards the veſicular baſe of the calyx.

Profeſſor Martyn, in his edition of Miller's Dictionary, has enumerated ten ſpecies of *Heliophila*, and Willdenow has deſcribed twelve. They are all natives of the Cape of Good Hope, and it will be ſufficient for us to deſcribe the original ſpecies in order to give a general idea of the genus.

1. H. *integrifolia*. Linn. Sp. Pl. 926. Jacq. Ic. Rar. v. 3. 506. (var.—"Leaves lanceolate, undivided."—Native of ſtony, uncultivated places at the Cape of Good Hope.—*Leaves* more or leſs hairy above, ſmooth underneath. *Calyx-veſicles* diaphanous. Linnæus has remarked in his *Mantiſſa*, that the *corolla* is blue, ſhutting at night, like flax. *Root* annual. *Stem* round, about ſix inches high, with axillary, aſcending branches. *Lower leaves* oppoſite, lanceolate-linear, thickiſh, undivided, three or four inches long; upper ones alternate, ſhorter. The whole plant is covered with ſlender hairs. *Calyx* yellowiſh. *Petals* of a deep blue or violet colour, white towards the baſe. *Seed* browniſh.

The other ſpecies known are H. *incana*, *amplexicaulis*, *flava*, *caneſcens*, *puſilla*, *filiformis*, *pendula*, *pinnata*, *coronopifolia*, *digitata* and *circæoides*. The laſt is Thunberg's *Chamira cornuta*, and is remarkable among its congeners for the broad heart-ſhaped leaves.

HELIOPOLIS, or *The City of the Sun*, in *Ancient Geography*, a city of Egypt, placed by geographers not far from *Hellé*, at ſome diſtance from the eaſtern point of the Delta. It was built, according to Strabo, on a long artificial mount of earth, ſo as to be out of the reach of the inundation. This cauſeway, covered with rubbiſh, is ſtill viſible two leagues to the N.E. of Grand Cairo, and three from the ſeparation of the Nile. This city had a temple to the ſun, where a particular place was ſet apart for the feeding of the ſacred ox, which was there adored under the name of Mnevis, as he was at Memphis, under that of Apis. There was alſo in this city another magnificent temple in the ancient Egyptian taſte, with avenues of ſphinxes and ſuperb obeliſks before the principal entry. Theſe temples were fallen into decay under the reign of Auguſtus; as the city had been laid waſte with fire and ſword by the fury of Cambyſes. Of the four obeliſks built by Sochis in that town, two were removed to Rome; another has been deſtroyed by the Arabs; and the laſt of them is ſtill ſtanding on its pedeſtal. It is compoſed of a block of Thebaic ſtone, perfectly poliſhed, and is, without including its baſe, 68 feet high, and about 6½ feet wide on each aſpect. They are covered with hieroglyphics. This beautiful monument, and a ſphinx of yellowiſh marble, overſet in the mud, are the only remains of Heliopolis. This city had alſo an oracle of

Apollo, and a college of prieſts ſacrificed by the barbarity of Cambyſes. Here they obſerved for more than 1000 years the ſtate of the heavens, and ſucceeded in compoſing the ſolar year of 365 days and a few minutes. It was chiefly at Heliopolis that Herodotus became acquainted with the ſciences and the Egyptian myſteries. This city alſo had the honour of teaching philoſophy to Plato, and of accommodating Eudoxus for thirteen years at its college of prieſts, whilſt he was preparing to appear as one of the moſt celebrated aſtronomers of his time. "What now remains to her of all her ſciences," ſays Savary, "of all her monuments? A Perſian barbarian overthrew her temples; a fanatic Arab burnt her books; and one ſolitary obeliſk, raiſed on its ruins, ſays to the paſſengers—*Here ſtood Heliopolis.*"

This city is mentioned in ſcripture (Gen. xli. 45. Ezek. xxx. 17.) and is called אָוֶן, *on*, in the Hebrew.

Beſides the city above-mentioned, there was another in Egypt, ſituated between Cairo, Coptos, and the Red ſea. From D'Herbelot (Bibl. Or.) we learn, that the Arabian writers call the city of Coos "Ainal Schams," *i. e.* the fountain of the ſun, or Heliopolis, the city of the ſun. According to him it is the ancient Thebes in Upper Egypt; and he ſays, the Arabian geographers place it in lat. 23° 30′. Long. 61° 30′. Dapper places Heliopolis 7000 paces E. of Cairo, and near the village of Mattarea, very far from the famous Thebes. It received the name of Heliopolis, as it is ſaid, from having a temple dedicated to the ſun, in which was a looking-glaſs, ſo diſpoſed, that it reflected the rays of that luminary all day long, and enlightened the whole temple with great ſplendour.

Onias, ſon of Onias III., having retired into Egypt, recommended himſelf ſo much to Ptolemy Philometer and his wife Cleopatra, as to obtain permiſſion to build a temple at Heliopolis, like that of Jeruſalem, for the uſe of the Jews ſettled in Egypt. (A.M. 3842, B.C. 162.) This temple ſubſiſted in the time of Veſpaſian, who commanded Lupus, governor of Egypt, to ſhut it up. (Joſeph. De Bell. l. vii. c. 37.) Paulinus, who ſucceeded Lupus, ordered it to be deſpoiled of all its ornaments and riches, and the doors to be ſhut, and prohibited religious offices to be performed there. A.M. 3854, B.C. 150.

HELIOPOLIS was alſo a city in Cœle-Syria, between Libanus and Antilibanus, Laodicea and Abila; otherwiſe called *Balbec*, which ſee.

HELIOPOLITES Nomos, a nome or province of Egypt, E. of the Nile, between the Aphroditopolite to the N., the Red ſea and Arabia Petræa to the E., and the Bubaſtide nome. It was traverſed lengthways by the canal of Trajan, which communicated with the Nile and the Red ſea by Heroopolis and Babylon.

HELIOSCOPE, in *Optics*, a ſort of teleſcope, peculiarly fitted for viewing and obſerving the ſun, without doing prejudice to the eye.

The word is compounded of ἥλιος, *the ſun*, and σκοπέομαι, *video, ſpecto, I ſee, view, conſider*.

Helioſcopes are neceſſary in viewing the phenomena of the ſun, as his ſpots, eclipſes, &c.

There are various apparatuſes of this kind. As coloured glaſſes are found to diminiſh the force of the ſun's rays, to make a helioſcope, it is enough that both the object-glaſs and the eye-glaſs of the teleſcope be of coloured glaſs; the firſt, *e. gr.* of red, and the latter green.

But as there is a neceſſity for the glaſſes to be very tranſparent and equally coloured, which rarely happens, Hevelius choſe rather to uſe two plain-coloured glaſſes, with a piece of paper between, either tied or cemented together, and applied before the eye-glaſs.

Dr. Hooke, in an expreſs treatiſe on helioſcopes, recommends four reflecting glaſſes placed in the tube: by theſe, he obſerves, the force of the rays will be ſo weakened, as only to ſtrike the eye with a 256th part of their force; and this helioſcope he prefers to all others.

M. Huygens's method is much eaſier; he only blackens the inſide of the eye-glaſs of the teleſcope, by holding it over the flame or ſmoke of a lamp or candle; or, which is yet more commodious, blackens a piece of plain glaſs, and holds it between the eye and the object-glaſs; or, which is the beſt of all, joins the ſmoked glaſs to another, with a rim of thick paper between, to keep the black from rubbing off, and fits the two into a cell or frame; to be applied between the eye and the eye-glaſs.

HELIOSTATA, from ἥλιος, *ſun*, and ἵστημι, *I fix*, the name of an inſtrument invented by Dr. S'Graveſande, and thus called from its property of fixing the ſunbeam in one poſition, *viz.* in a horizontal direction, acroſs the dark chamber whilſt it is uſed.

This is an automaton, or piece of clock-work, conſiſting of the following parts: A A (*Plate* VI. *Optics*, *fig.* 1.) is a frame in which a metalline ſpeculum S is ſuſpended, moveable about its axis by means of two ſmall ſcrews at *a a*. This frame is fixed to the piece C, which, being hollow, is moveable upon the cylindric ſhaft P about the iron pin *e*. (See the part by itſelf.) This pillar P is fixed to a triangular baſe or foot ſet perpendicularly by the three ſcrews B, B, B.

On the back part of the ſpeculum is fixed a long cylindric wire, or tail D E, in a perpendicular poſition. By this it is connected to the ſecond part of the helioſtata, which is a common twenty-four hour clock, repreſented at H; the plane of which clock is parallel to that of the equator in any given place. This clock is ſuſtained on the column F G, in which it is moveable up and down by a thin lamina or plate that enters it as a caſe, and fixed to a proper height by the ſcrews *d*, *d*, at the ſide. The whole is truly adjuſted to a perpendicular ſituation by means of the three ſcrews I, I, I, in the tripod I L M, and the plummet Q, whoſe cuſpis muſt anſwer to the point *o* beneath.

The axis of the wheel, which moves the index N O over the hour-circle, is ſomewhat large, and perforated with a cylindric cavity verging a little to a conical figure; and receives the ſhank *p q* of the ſaid index N O very cloſe and tight, that by its motion the index may be carried round. In the extremity O of the index is a ſmall cylindric piece *n*, with a cylindric perforation to receive the tail *t* of the fork T, yet ſo as to admit a free motion therein. In each ſide of the fork are ſeveral holes exactly oppoſite to each other, in which go the ſcrews *r*, *r*, upon whoſe ſmooth cylindric ends moves the tubular piece R on its auricles *m*, *m*.

When the machine is to be fixed for uſe, another part is made uſe of to adjuſt it; which is called the *poſitor*, and is denoted by the letters V X Y Z. The cylinder C is removed with the ſpeculum from the foot P, and the braſs column V X put on in its ſtead, and adheres more ſtrictly to the pin *c*, that it may keep its poſition while the machine is conſtituted.

On the top of the column, about X as a centre, moves the lever Y Z, ſo that it may be any-how inclined to the horizon, and keep its poſition. The arm Y Z may be of any length at pleaſure, but the arm Y Z is of a peculiar conſtruction, and of a determinate length. To this arm, which extends no farther than *y*, is adapted a ſliding-piece Z *x* ſharp-pointed at Z. By this the arm X Z is determined to a given length, the piece Z *x* being fixed by the ſcrews *z*, *z*.

Upon this arm is drawn the ſhort line *v x*, by which it may

may be lengthened in the whole, and is $\frac{3}{109}$ of the whole length X Z when ſhorteſt. The reaſon is, this arm is always to increaſe and decreaſe in proportion to the ſecant of the ſun's declination to the radius X Z, when ſhorteſt; but the radius is to the ſecant of 23° 30′, (the ſun's greateſt declination,) as 10000000 to 10904411, or as 100 to 109.

Now the reaſon of this conſtruction of the arm X Z is to find for any given day the diſtance of the centre of the ſpeculum S from the top *l* of the ſtyle *l* N, which muſt ever be equal to the ſecant of the ſun's declination; for it muſt always be equal to the diſtance of the top of the ſaid ſtyle *l* from the centre of the cylinder R in the fork T, and that is ever equal to the ſaid ſecant of declination.

For ſince the ſtyle *l* N and the fork T are in a poſition parallel to each other, therefore the middle hole in the ſides of the fork being (as they muſt be) of the ſame height above the end of the index O as is the height of the ſtyle N T, it is evident that on an equinoctial day the ſun's rays will paſs directly through the perforation of the piece R, if it be put in a poſition parallel to the plane of the ecliptic, or that of the clock; and alſo that the top of the ſhadow of the ſame ſtyle will fall exactly on the ſaid hole.

In this caſe the top of the ſtyle is at the leaſt diſtance from the central point of R, and therefore may be repreſented by radius, while in any other poſition above or below, the diſtance will increaſe in proportion to the ſecant of the angle which the rays make with this firſt or middle ray, that paſs by the top of the ſtyle, and through the hole R.

Now it may be demonſtrated, that on any day of the year if the clock and its pedeſtal be ſo fixed that the line of XII be exactly in the meridian, and that the poſition of R in the fork be ſuch, that the ſun's rays go directly through it, and the ſhadow of the ſtyle's top fall juſt upon the hole; moreover, if the diſtance of the centre of the ſpeculum S from the top of the ſtyle *l* be made equal (by the poſitor) to the diſtance of the central point R therefrom; and laſtly, the tail of the ſpeculum D E paſſing through R; if then the clock be put into motion, the index N O ſhall carry about the tail of the ſpeculum in ſuch a manner, that at all times of the day when the ſun can come upon the ſpeculum it will reflect the rays conſtantly in one and the ſame poſition and direction all the time without variation.

The machine thus conſtituted is placed in a box or caſe, and ſet in a window with one ſide open, expoſed to the ſun, and all the other parts cloſe; ſo that when the room is made dark, and the ſolar microſcope fixed to the fore-part of the box in which the helioſtata is placed, juſt againſt the centre of the ſpeculum to receive the reflexed horizontal beam, all the experiments of the darkened room are then performed as uſual. This is a very ingenious conſtruction of a ſolar microſcope apparatus, and full of art, but, it is to be feared, too expenſive and troubleſome for common uſe. However, it is eaſy to ſee that this machine is capable of being greatly reduced; for it may be made to anſwer the end very well without a clock; alſo the ſpeculum may be glaſs inſtead of metal, and all fixed on one foot or pedeſtal.

For a farther account of this inſtrument, the principles of its conſtruction, and its uſe, ſee S'Graveſande's Phyſices Element. Mathematica, &c. tom. ii. p. 715, &c. ed. 3tia. 1742.

HELIOSTROPHUS, in the *Materia Medica*, a name given by ſome of the Greek writers of the later ages to the gum ammoniacum of the ancients, which ſeems to have been a very different thing from what is called gum ammoniacum at this time; it being yellow and friable, our's whitiſh and tough.

HELIOTROPE, Heliotropium, among the *Ancients*, an inſtrument or machine for ſhewing when the ſun arrived at the tropics and the equinoctial line. This name was alſo uſed for a ſun-dial in general.

Heliotrope, in *Mineralogy*, *Silex heliotropius*, Wern. *Jaſpis variegata heliotropius*, Wall. *Heliotrope*, Broch. *Heliotropium*, Kirw. *Eliotropio*, Napion. *vulg. Blood-ſtone*, Engl. *Jaſpe oriental*, *Jaſpe ſanguin*, &c. Fr. *Grüner jaſpis*, *Orientaliſcher jaſpis*, Germ.

The colour of this mineral is green, generally between graſs and leek-green; the depth of the colour is proportionate to the degree of tranſparency: the varieties that are but little tranſlucent are ſometimes blackiſh-green; it alſo occurs of a colour between ſeladon and blueiſh-green, and ſometimes exhibits a mixture of ſeveral of theſe tints unequally diſtributed. The red and yellow ſpots and veins with which it is often marked, are produced by diſſeminated particles of jaſper of thoſe colours.

It is found maſſive and in rounded and angular pieces, with now and then ſmall botroidal ſurface; a ſpecimen before us is furniſhed with many minute globular excreſcences, coated with a yellow ochrey cruſt.

It is hard, but eaſily frangible. Its fracture large and flat-conchoidal, approaching to even; internal luſtre gliſtening, often approaching to reſinous. Fragments indeterminately angular, very ſharp-edged, of different degrees of tranſlucidity, from nearly tranſparent to feebly tranſlucent at the edges.

Specific gravity 2.633, Blumenbach; 2.620—2.700, Kirwan.

The heliotrope is infuſible before the blow-pipe without addition; it only becomes rather more brittle; its green colour is changed into greyiſh-white, or reddiſh-brown, the red ſpots diſappear, leaving ſmall vacuities, with a loſs in weight of 0.01.

Its native places are not well aſcertained. It is well known that the epithet *oriental*, applied to ſtones held in eſtimation, conveys no other meaning than that of ſuperior quality or beauty. It appears, however, to be met with in ſeveral parts of Weſtern Aſia, eſpecially in Perſia; alſo in Egypt, in ſome parts of Italy, eſpecially Sicily, (where it likewiſe occurs with yellow veins,) and in Iceland.

The heliotrope is *uſed* for ornamental purpoſes, and for ſnuff boxes, ſmall veſſels, &c.; nor is it neglected by the glyptic artiſt. See Gems, *engraved*.

It is probable, that the heliotrope of Pliny, which is deſcribed by this author as a leek-green ſtone traverſed by blood-red veins, is the ſame with our blood-ſtone. It received the Latin name from its ſuppoſed quality of reflecting the ſolar rays blood-red, when immerſed in water.

The green baſe of blood-ſtone, (the grains of red jaſper are accidental,) is an intimate combination of chalcedony with green earth, not with chlorite. The more tranſparent varieties reſemble much the plaſma, and ſome varieties of praſe.

Of its geognoſtic ſituation we know but little; according to the accounts of ſome mineralogiſts it occurs, in a ſimilar manner as chalcedony, in rocks belonging to Werner's fletztrap-formation.

Mr. Accum has given the deſcription and analyſis of an Egyptian heliotrope, which, in its external and phyſical characters, agrees pretty well with the European and Aſiatic varieties already known. By ignition it changed its original colour for chocolate brown, with white and yellow veins, and loſt rather more than $\frac{1}{21}$ of its weight. The 500 grains analyſed by the above chemiſt, conſiſted of

HELIOTROPIUM, in *Botany*, ἡλιοτροπιον το μεγα of Dioſcorides, from ἡλιος, *the ſun*, and τροπη, a *turning* or *inclination*, "becauſe," ſays that ancient writer, "it turns its leaves round with the declining ſun." Whether he literally means the leaves of the plant, or the corolla of the flowers, may admit of doubt, but the latter is generally ſuppoſed; yet theſe bloſſoms are too inconſpicuous, and their change of poſition, one would think, too trifling, to have attracted notice on this account, as ſo many common flowers more evidently exhibit the ſame phenomenon. The deſcription of Dioſcorides, however, is preciſe enough, and that of Ovid in his fable of Clytie, though vague, is not contradictory. Yet the *American* Sunflower, ſee HELIANTHUS, commonly ſerves, as in a beautiful picture by Annibal Caracci which has been engraved, to illuſtrate this *Grecian* ſtory. A fine buſt of Iſis, emerging from a flower of the Lotus, which belonged to the late Mr. Townley, was, on its firſt arrival in England, taken, without heſitation, for Clytie changing into a ſun-flower, what is meant for the Lotus, having a great reſemblance to the *Helianthus*. This error, very ſtriking to a botaniſt, was immediately corrected by the excellent Mr. Dryander, whoſe accuracy only exceeded his vaſt knowledge. Richelet, in his French dictionary, though a moſt claſſical writer, confounds the *Tourneſol* and the *Soleil* as one and the ſame plant. The latter, nevertheleſs, is the *Helianthus*, the former the *Heliotropium*; or more generally in France, *Croton tinctorium*, which affords the blue dye called *litmus* or *lacmus*, and has nothing in common with the genus *Heliotropium*, except a reſemblance to the ſhape and grey hue of its leaves. See *H. europæum* hereafter.—Linn. Gen. 73. Schreb. 99. Willd. Sp. Pl. v. 1. 740. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 284. Sm. Prodr. Fl Græc. v. 1. 111. Brown. Prodr. Nov. Holl. 492. Juſſ. 130. Lamarck. Illuſtr. t. 91. Tourn. t. 57. Gærtn. t. 68.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Aſperifoliæ*, Linn. *Borragineæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, with five ſegments, permanent. *Cor.* of one petal, ſalver-ſhaped; tube the length of the calyx; limb flat, half five-cleft, obtuſe, with ſmaller and ſharper ſegments between the larger ones; orifice without valves. *Stam.* Filaments five, very ſhort, in the mouth of the corolla; anthers ſmall, concealed by the tumid or plaited edge of the orifice. *Piſt.* Germens four, ſuperior; ſtyle thread-ſhaped, the length of the ſtamens; ſtigma notched. *Peric.* none; except the upright, permanent, unaltered calyx. *Seeds* four, ovate, pointed, in the bottom of the calyx.

Eſſ. Ch. Corolla ſalver-ſhaped, five-cleft, with intermediate teeth: its mouth without valves. Seeds four, naked.

Obſ. Mr. Brown conſiders the intermediate teeth as not invariably conſtant, and defines the ſtigma as peltate and ſomewhat conical.

The 14th edition of Syſt. Veg. has nine ſpecies, Willdenow 22, to which Mr. Brown adds four, (making Forſkal's *H. ovalifolium* diſtinct from *coromandelianum* of Retzius), which are ſtrictly of this genus; and nine beſides which conſtitute a ſection, or ſub-genus, termed *Orthoſtachys*. Theſe have ſolitary and ſtraight, not twin and revolute ſpikes; the throat of their corolla is bearded within, which in the former is beardleſs; their embryo curved, which in thoſe is ſtraight; and they have moreover a leafy bractea nearly oppoſite to every flower, which the others have not. —On the other hand, Mr. Brown excludes from the genus altogether *H. indicum* of Linnæus, becauſe its fruit is deeply two-lobed, like a mitre, the lobes each ſeparable into two, and each of theſe has two cells, one of which is empty. We ſcarcely think this more thtn a ſlight aberration of ſtructure, in a natural genus. The ſame ingenious author removes *H. malabaricum* of Retzius, and *ſupinum* of Linnæus and Willdenow, from hence, becauſe their tubular calyx has but ſhallow teeth; this, however, we preſume to think, the analogy of the natural order will hardly juſtify. He ſeparates *villoſum* of Willdenow with great propriety, it having, according to Mr. Brown, five awl-ſhaped teeth or valves in the mouth of the flower.

Good examples of this genus are the following.

H. *peruvianum*. Peruvian Turnſole or Heliotrope. Linn. Sp. Pl. 187. Curt. Mag t. 141.—Leaves elliptic-lanceolate. Stem ſhrubbly. Spikes numerous, collected into a corymbus.—Native of Peru. Well known, and generally cultivated, for the delightful almond ſcent of its *flowers*, which are of a blueiſh white, and produced in a ſtove or warm green-houſe at almoſt all ſeaſons. The *ſtem* is a foot or two in height, rough, as well as the *leaves*, which are alternate, rugoſe, ſomewhat crenate, an inch and half, or more, in length, of a dull darkiſh green. The *corolla* is prettily undulated, the *flowers* numerous and cloſe-ſet, redder before they open. It is eaſily propagated by cuttings, but requires a pure air, ſome artificial heat, and in hot weather plenty of water. Miller received the ſeeds about ſixty years ago from the duke d'Ayen afterwards Marechal de Noailles, and was the firſt who raiſed the plant in England.

H. *europæum*. European Turnſole.—Linn. Sp. Pl. 187. Jacq Auſtr. t. 207.—Leaves ovate, entire, rugged, downy. Spikes in pairs.—Native of the ſouth of Europe. Dr. Sibthorp found it a moſt common weed in the fields and vineyards of the iſlands of the Archipelago, as well as about Athens. This is unqueſtionably the plant of Dioſcorides above-mentioned. His ἡλιοσκοπιον το μικρον is probably the *Croton tinctorium*.—The *root* of the *H. europæum* is annual. *Herb* about a foot high, much branched, of a pale greyiſh green and hoary. *Flowers* ſmall and white. Jacquin ſays the intermediate teeth of the corolla are often wanting.

H. *gnaphalodes*. Linn. Sp. Pl 188. Pluk. Phyt. t. 193. f. 5.—Leaves linear, obtuſe, denſely ſilky. Corolla externally hairy. Stem ſhrubby.—Native of the Weſt Indies. Diſtinguiſhed by its copious, narrow, thick and ſilvery *leaves*. The *flower-ſtalks* are uſually in pairs, terminal.

From Willdenow's enumeration of ſpecies muſt be removed the laſt, *H. pinnatum*, which is more properly deſcribed by Lamarck as *Hydrophyllium magellanicum*. Journ. d'Hiſt. Nat. v. 1. 372. t. 19. Vahl, whom Willdenow copies, ſeems to have made it a *Heliotropium* becauſe Commerſon had done ſo, without adverting to the ſtigmas, which in Commerſon's ſpecimens are evidently deeply divided. Willdenow appears not to have ſeen the *Journal d'Hiſtoire Naturelle*. We take the opportunity of this reference to it to correct an over-ſight of our own, under the article HELLENIUM. Lamarck deſcribes in the 2d vol of the Journal, 213. t. 35, *Helenium canaliculatum*; "leaves lanceolate, toothed.

toothed. Stems ſimple. Florets of the radius channelled." —Its native country is unknown, but the roots were ſuppoſed to have been ſent from the Engliſh gardens to thoſe of Paris. We find a ſpecimen very much like it in the Linnæan herbarium, except having four flowers, in a corymboſe poſition, at the top of the ſtem. This was conſidered as the *autumnale* by Linnæus, nor can we well diſtinguiſh it. Our *longifolium* agrees with Lamarck's figure in the flower, but the long, narrow, nearly entire leaves are very different. We conclude that the different appearances of this genus, whether ſpecies or varieties, are not yet clearly underſtood. S.

HELIOTROPIUM, in *Gardening*, comprehends plants of the ſhrubby, annual, biennial, and herbaceous kinds; of which the ſpecies moſtly cultivated are, the Peruvian turnſole, or heliotrope (H. peruvianum); the Indian turnſole, or heliotrope (H. indicum); the ſmall flowered turnſole, or heliotrope (H. parviflorum); the glaucus turnſole, or heliotrope (H. curaſſaicum); and the Canary heliotrope (H. canarienſe).

The ſecond ſpecies has a variety which is a ſmaller plant, being ſeldom more than two feet in height, with leaves an inch and half in length, and half an inch in breadth; and the ſpikes of the flowers ſlender, and only about two inches long, the flowers being ſmall, and of a light blue colour.

Method of Culture.—The firſt ſpecies is capable of being raiſed by ſowing the well ripened ſeeds, which ſhould be done in the early ſpring ſeaſon, upon a moderate hot-bed, or in pots, which ſhould be plunged in the ſame ſort of bed. As ſoon as the young plants have attained a proper growth, they muſt be removed into ſeparate pots of ſmall ſizes filled with light mould, replunging them in the hot-bed and affording them due ſhade until they have become fully rooted again.

After this they ſhould be gradually inured to the action of the open air, in order to be ſet out in warm ſituations during the ſummer months. But they muſt conſtantly have the protection of a good green-houſe, in the autumn and winter ſeaſons.

This ſpecies is alſo capable of being increaſed by cuttings, which ſhould be planted out in pots of light mould during the ſummer ſeaſon, plunging them in a mild hot-bed immediately afterwards. The cuttings ſoon ſtrike root and form plants, which afterwards require to be managed in the ſame way as the ſeedlings; but they rarely make ſuch good plants.

The three ſucceeding ſpecies may be raiſed by ſowing the perfectly ripened ſeeds in the early ſpring months upon a moderate hot-bed, removing them as the heat declines in it, to another, if there ſhould be a neceſſity; letting them have the general treatment of balſams and other tender annuals, and, about the middle of the ſummer ſeaſon, removing them to the places where they are to flower, with good balls of earth about their roots. In this mode they moſtly ſucceed well.

The laſt ſpecies may be increaſed by planting cuttings of the young ſhoots during the ſummer, in pots, or in a ſhady part of the ground, letting them have water in a pretty free manner. In the latter inſtance, when they are become perfectly rooted, they may be carefully taken up, and be planted out in pots, depoſiting them in ſhady ſituations, until they are again become well rooted.

In their after management they ſtand in need of the protection of the green-houſe during froſty and other ſevere weather, being put with plants of the more hardy green-houſe ſorts, ſuch as thoſe of the myrtle and other ſimilar kinds, which require in mild open weather the free admiſſion of air.

The firſt and laſt ſpecies afford much ornament among the more hardy ſorts of green-houſe plants; and the reſt have a good effect among the more tender flowery plants, either in pots or the borders and clumps of pleaſure grounds.

HELISPHERICAL LINE, in *Navigation*, denotes the rhumb line.

It is thus called, becauſe, on the globe, it winds round the pole helically, *i. e.* ſpirally, and ſtill comes nearer and nearer to it.

HELIX, in *Anatomy*, is the whole circuit or extent of the auricle, or border of the ear outwards.

In oppoſition to which, the inner protuberance ſurrounded thereby, and anſwering thereto, is called *anthelix*.

HELIX is alſo applied, in *Architecture*, to the caulicoles, or little volutes, under the flowers of the Corinthian capital; called alſo *urillæ*. See CAULICOLES.

HELIX, in *Conchology*, a genus of univalves, the animal of which is a limax; the ſhell ſpiral, ſub-diaphanous, and brittle; and the aperture contracted, ſemi-lunar, or roundiſh.

Before the time of Linnæus, the ſhells embodied by that writer, under the name and character above-mentioned, were too indiſcriminately called *cochleæ*, a term applied to the helices of the ſame natural family, and ſome analogous ſhells, in common with others, bearing only a remote reſemblance to them, and that barely in the general form (ſuch as the neritæ and turbines). The early writers, however, divided their *cochleæ* into two families as we find in Liſter, the diſtinction of which is very ſtrongly marked by nature in their inſtinctive habits, namely, the *terreſtrial*, and the *aquatic*; and beſides this, they had ſub-diviſions of the latter, conſiſting of two families, the firſt comprizing thoſe kinds which inhabit the freſh water, and the other the ſea. Theſe diſtinctions were incompatible with the principles of the Linnæan ſyſtem, the foundation of which reſted on external and immediate characters, and they were therefore rejected by that author; but notwithſtanding this, he defined the genus collectively with greater certainty than his predeceſſors, and for this reaſon his character is uſeful. Yet the genus, as he propoſed it, was ſtill too vague and indeterminate, and of this, Linnæus was himſelf ſenſible, for in order to embrace the ſpecies he deſcribes, he was conſtrained to inſtitute many ſections, the very character of which, as he himſelf deſcribes them, prove they are generally different. Various alterations in the diſtribution of the Linnæan ſpecies have been propoſed by ſubſequent writers, ſome of which are to be eſteemed improvements, but it is not to be denied that the inſtitution of ſeveral new genera, and conſequently a new arrangement altogether, would alone enable us to reduce the whole of the diſcordant ſpecies it contains at preſent to lucid order. This is not a new idea. Geoffroy long ſince conſtituted ſeveral diſtinct genera of the Linnæan helices; and the number has been progreſſively increaſed with various amendments and modifications by later writers, as Da Coſta, Fabricius, and Poli, and alſo of late by Müller, Bruguière, Lamarck, Draparnaud, and Latreille. Some of the genera of Geoffroy, as well as thoſe conſtructed recently, are very good, others are obſcure, and, in our own opinion, not altogether neceſſary; while again, if we miſtake not, two or three other new genera might be introduced with ſome advantage and propriety. This may appear obvious to others from a due conſideration of the following new genera, into which the Linnæan helices are now divided.

Helix. The tribe or genus of the Linnæan helices, to which, by the conſent of moſt writers, the name of helix is retained, conſiſts of thoſe ſhells that are ſub-globoſe or orbicular, with the ſpire convex or conoid; and the aperture entire, and roundiſh, or ſomewhat lunar. Theſe are uſually divided into two or three families, according to the form of the ſhell, as conic, globoſe, and ſub-depreſſed. The firſt of theſe ſections is exemplified by the *helix elegans* (Gualt. tab. 1. fig. o.);—the ſecond by *helix variabilis*, Gualt. *piſana*, Müll.; and *pomatia*, *nemoralis*, and *griſea*, Linn.;—the third by the Linnæan ſpecies algira, and alſo hiſpida and ericetorum.

Helicina is a genus eſtabliſhed by Lamarck upon a ſingle ſpecies deſcribed by Liſter. (Tab. 17. f. 59.) The ſhell of this kind is ſub-globoſe, the opening entire, ſemi-oval, covered with an operculum; the pillar lip callous, and compreſſed below.

Janthina is another of the ſub-globoſe helices, the ſhell of which is diaphanous; and the opening triangular, with an angular ſinuoſity at the right margin. The Linnæan helix janthina affords an illuſtrative example of this genus.

Ampullaria is a genus formed of the ſpecies helix ampullaria by Lamarck, and which ſeems to form an intermediate tribe between the true helices and the newly inſtituted genus Bulimus. The character conſiſts in the ſhell being globoſe, ventricoſe, umbilicated at the baſe, without any calloſity at the left margin, and having an opening entire, of greater length than breadth.

Bulimus has an oval or oblong ſhell, with the laſt whorl of the ſpire much larger than the one preceding; the opening entire, of greater length than breadth, and the pillar lip ſmooth and not truncated at the baſe. The Gmelinian helix ſepium is ſaid by Boſc to be of this genus. Bulimus is a genus inſtituted by Bruguière.

Lymnæa is a genus eſtabliſhed by Lamarck, and adopted by Draparnaud, being that originally formed by Geoffroy under the name of *buccins*, and which ſeem cloſely allied to the bulimus before-mentioned. The ſhell is oblong, and nearly turrited; the opening entire, of greater length than breadth; and having on the pillar lip a very oblique plait or fold. Some authors divide theſe into two families, according to the height of the ſpire. The Linnæan helix ſtagnalis, and bulimus auricularius of Bruguière, (helix auricularia, Linn.) are both of this genus.

Melenia is diſtinguiſhed by the turrited form of the ſhell; the opening being entire, of greater length than breadth, and widening at the baſe, and the pillar lip without plait or fold. This genus is elucidated by the helix amarula of Linnæus; melania of Lamarck, and bulimus of Bruguière.

Planorbis contains ſuch of the Linnæan helices as are of a diſcoid form with either the ſpire low, flat, or depreſſed; the opening entire, and of greater length than breadth. This is a genus propoſed by Geoffroy, and afterwards adopted by Da Coſta, Müller, and moſt of the late writers. The Linnæan flat freſh water helices, as cornea, ſpirorbis, and planorbis, appertain to this genus.

Theſe appear the moſt material among the newly inſtituted genera of Linnæan helices, and ſuch as we ſhould conceive moſt worthy of being retained, were it in contemplation to form an improved arrangement of the ſpecies compoſing that extenſive genus. Some of the above genera are terreſtrial, reſiding entirely on various kinds of plants, others aquatic, living either partially or ſolely in the ſea; and the remainder inhabit freſh waters.

The animals of certain kinds are pretty clearly aſcertained; others, and thoſe eſpecially that are natives of diſtant climes, are totally unknown. Moſt, if not all the animals of this tribe, unite in each individual the prolific properties of both ſexes, ſubject nevertheleſs to certain modifications which demand the co-operation of another of its ſpecies, in the ſame manner as among animals that are each of one ſex only. The globoſe land helices, ſuch as *hortenſis*, or the garden ſnail, and many others, are known by naturaliſts to be of that deſcription. There is ſome little variation in the mode of courtſhip in particular tribes; among which that of the garden ſnail is by no means the leaſt curious, or deficient in intereſt; and this alſo will ſerve to explain, in a general way, the manners in which the amours of theſe animals are conducted. The pairing ſeaſon happens about May or June, and at this period every individual is furniſhed with a number of little pointed horny darts, contained within a cavity on the right ſide of the neck; and when they approach each other within the ſpace of two or three inches, a ſcene of apparent hoſtility commences, each diſcharging theſe darts with conſiderable force at the other. The battle continues till the reſervoir be exhauſted of theſe offenſive weapons, and then a perfect reconciliation and union takes place. The eggs are about the ſize of peas, and perfectly round. (Brit. Shells, &c.) Something ſimilar to this is obſervable in the courtſhip of other ſpecies. There are ſome, however, in which a difference of manners is perceptible in this reſpect, though none are ſo remote as to afford any reaſonable grounds for believing they are not hermaphrodite. The animals of the globoſe land helices, or ſnails, are ſo familiar as not to require particular deſcription. Thoſe of Lymnæa (all which are of the aquatic kind) have the head furniſhed with two flat tentacula, having the eyes placed at the inner baſe; two triangular ears, and the feet ſmall. In the planorbis which are alike aquatic, the animals have two long filiform horns, at the inner baſe of which are placed the eyes, and their feet are ample.

The following diſtribution of the helices, in which they are conſidered after the Linnæan manner, as conſtituting only a ſingle genus, is nearly in conformity with the arrangement adopted in the Gmelinian Syſtema Naturæ.

Species.

* *Shell roundiſh, and without umbilicus or perforation.*

Hortensis. Shell imperforated, globular, pale with broad interrupted brown bands; lip white. Donov. Br. Shells. *Cochlea vulgaris*, Da Coſta. *Helix hortenſis*, Penn. *H. hortenſis*, Maton and Rackett Linn. Tranſ.—*Helix lucorum*, Pultney.—*Helix aſpera*, Montagu.—*Common garden ſnail.*

The common variety of the garden ſnail is ſo familiar, that it would appear ſuperfluous to enter into its deſcription with minuteneſs; there are, however, few ſhells more variable; it is an inhabitant of Europe, Aſia, and other parts of the world, and in point of ſize, colours, and diſpoſition of its marks, exhibits the moſt inconceivable diverſity; we are ourſelves acquainted with many hundred diſtinct varieties. It may be obſerved generally that the larger, and more beautiful kinds are natives of Aſia and Southern Europe, the ſize gradually diminiſhing, and the colours becoming leſs vigorous as the ſpecies approaches the north. Theſe ſnails feed on all kinds of vegetables, and are conſidered very deſtructive in orchards and gardens; they couple about May or June. Snails are uſed with ſucceſs, it is ſaid, in ſome conſumptive caſes.

Nemoralis. Imperforated, ſub-rotund, thin, pellucid, and banded; aperture ſomewhat roundiſh-lunate. Linn.

Cochlea fasciata, Da Costa. *Girdled snail*, Donov. Brit. Shells.

A general inhabitant of Europe, living among trees and hedges, and in gardens. The breadth is about an inch, the colours variable, the species affording nearly forty distinct and permanent species. The most frequent varieties are those with yellowish or browniſh grounds, marked with four or five spiral lines or bands of brown; and also those of an uniform colour without bands. Those of an uniform pale citron, are rather less frequent; and those in which the flesh colour prevails, either with or without bands, are still more rare. Most of the varieties are remarkable for their elegance.

Janthina. Shell nearly imperforate, roundish, obtuse, diaphanous, and very brittle; aperture dilated behind, with an emarginate lip. Linn.

An inch in height; colour violet, with a sub-triangular aperture; animal shines by night, and stains the hand with a purple or violet dye.

Gigantea. Shell imperforate, roundish, solid, with a depressed spire. Scopoli.

Shell very large, smooth, white, and browniſh within; spire yellowish, with six contiguous whorls, the first bay within; lip margined.

Vivipara. Shell imperforated, sub-oval, and obtuse; olive girdled with about three brown lines; spire ventricose; mouth somewhat orbicular. Donov. Br. Shells. *Helix vivipara*, Linn. *Vivipara fasciata fluviatilis*, List. *Cochlea vivipara*, Da Costa. *Viviparous water-snail.*

Found in stagnant waters and rivers in most parts of Europe. The shell is thin, pellucid, and very finely striated longitudinally; the length from one to two inches; the colour more or less inclining to olive, or sometimes reddish, and the bands or spiral lines, which are three in number, reddish or chesnut. The head of the animal bears some resemblance to that of a bull, and hence it is called by some French writers *limaçon à tête de bœuf*. The species is viviparous, whence its trivial name, and is said to feed on duck-weed.

Fasciata. Shell ovate-ventricose, white, with three shining bands of red. Gualt.

Length from nine to fifteen lines; bands on the first whorl three, on the second two; spire acute; throat blueish-white. Native of Italy.

Dissimilis. Shell sub-ovate, pointed, yellowish white, with the lip black. Gmel. *Nerita dissimilis*, Müll.

Inhabits Tranquebar. The shell pellucid, glabrous with six whorls, and a pellucid, glossy, yellowish-brown operculum.

Variegata. Shell imperforate, sub-ovate, barred, and covered with a brown cuticle; aperture white within. Knorr.

Native of Italy. Shell brown and radiated with white; and marked with yellow white spotted bands; or sometimes reddish white with four brown bands undulated with white, and two narrower ones undulated with white on the second whorl.

Solida. Shell imperforated, solid, ovate and smooth, with six round contiguous whorls; pillar thickened. Born.

Length an inch and three lines; shell rosy, with very thin red and white interrupted lines.

Aperta. Shell imperforate and sub-globular, very finely striated longitudinally; whorls three, the first ventricose; aperture lunar; pillar spiral. Chemn.

Prevalent colour brown; country unknown.

Grisea. Shell imperforated, sub-ovate, obtuse, grey, with two pale bands; aperture rather oblong. Gualt.

Resembles helix pomatia, and inhabits the woods of Europe.

Hæmastoma. Shell imperforated, roundish, brown, with a longitudinal white band; aperture purple. Seba, &c.

Native of Ceylon; breadth an inch and a half; the shell obtuse, within white, with five round whorls, the first twice the size of the rest, the last reddish.

Pulla. Shell imperforated, sub-ovate, brown and striped; aperture oblique, margined and whitish. List.

Whorls four; the breadth two inches, height an inch and a half. Country unknown.

Venusta. Shell imperforated, sub-ovate, sulphur colour, with a white band margined with red; lip reflected and margined. Kæmm.

Breadth ten lines, height rather less; whorls four, thin, smooth, within whitish.

Picta. Shell imperforated, sub-globular, glabrous, with four round whorls, the first ventricose, the others depressed; aperture lunar. Born.

Inhabits Italy. The shell pale cinereous, with a brown pillar, and transverse line at the suture; sometimes rosy, or sulphur, with a brown pillar and red lines.

Versicolor. Shell imperforated, roundish, and transversely striated; whorls round, the first ventricose; aperture ovate. Born.

Size of helix pomatia; shell snowy, with transverse parallel brown lines and intermediate saffron and rosy bands; pillar rosy.

Perversa. Shell sub-umbilicated, ovate-oblong, and sulphur colour; whorls reversed. List. Chemn. &c.

This species inhabits India, and varies from one to two inches in length, the whorls are from six to eight in number, and the difference in colour not unfrequently considerable; the prevailing hues are yellow, more or less inclining to sulphur, green, or white, with bands and streaks of brown, or spots of reddish.

Dextra. Shell conic yellow, with a reflected white lip. Martini.

Nearly resembles the last, except that the whorls of the spire are not reversed; the shell glabrous, sulphur, citron, or white, variously streaked, or spotted with brown and sometimes plain.

Recta. Shell conic, a little pointed, whitish, with a band and streaks of rufous; lip reflected. Müll.

Length two inches and five lines; whorls seven. Native place unknown.

Inversa. Shell conic, pointed, and reversed, with a rufous band and streaks; lip reflected. List.

Resembles the last species, but the whorls are contrary, eight in number, and obliquely striated; aperture ovate, and with the lip white. Length two inches and a half. Inhabits Mauritius and Bourbon islands.

Interrupta. Shell conic, pointed, white, with fulvous streaks; lip white and reflected. Chemn.

Country unknown. Shell twenty-two lines in length; whorls seven, with a number of transverse tricoloured lines, being fulvous above, rufous beneath, and obsolete in the middle.

Jamaicensis. Shell globular, chesnut-brown, barred with white; lip fringed white; crown obtuse. List.

Native of Jamaica.

Contraria. Shell conic, pointed, and contrary, white, with undulated interrupted brown streaks; lip reflected. Chemn.

Length fifteen lines; shell polished, the extreme tip black; aperture ovate, with pellucid streaks. A rare kind; the country unknown.

LÆVA. Shell ſub-cylindrical, glabrous, contrary, and barred; lip ſlightly reflected; pillar yellow. Liſt.

White, with from two to ſix rufous bands; length from twelve to ſixteen lines.

ARENARIA. Shell gloſſy, whitiſh with very thin longitudinal ſtriæ; ſpire contrary and hemiſpherical. Spengler.

A minute ſhell, found on the ſands of the Armenian ſhores.

RHODIA. Shell ſub-globular, depreſſed, with a concave baſe and lunate aperture. Chemn.

Inhabits Rhode Iſland.

PUPICA. Shell oblong, rather wrinkled, and roſy; aperture toothleſs; lip dilated and white. Chemn.

Length twenty lines, poliſhed with a white mouth; aperture ovate-oblong; lip yellowiſh roſy; whorls about ſix.

LABIOSA. Shell oblong, poliſhed, and white; aperture toothleſs; lip dilated. Chemn.

Native of India. The length eleven lines; ſhell diaphanous, with eight whorls; aperture ovate; margin of the lip a little jagged.

* * *Shell roundiſh; with an umbilicus or perforation.*

POMATIA. Shell umbilicated, ſub-globoſe, whitiſh faſciated with brown; mouth rather roundiſh-lunate. Donov. Br. Shells. *Helix pomatia*, Linn. *Cochlea pomatia*, Da Coſta. *Pomatia Geſneri*, Liſt. *Edible ſnail.*

This is the largeſt ſpecies of land ſnail in England. When full grown the ſhell is from an inch and a half to two inches in diameter in our climate; on the continent, towards the ſouth, its ſize is much ſuperior. It is found in hedges, woods, and ſimilar ſituations.

The animal of this ſpecies being large and fleſhy, and not of an unpleaſant flavour, has been eſteemed an article of food from early times. It was a favourite diſh with the Romans, who had their cochlearia, or ſnail-ſtews, in which they were bred and fattened. Pliny relates that the firſt inventor of this luxury was Fulvius Harpinus, a little before the civil wars between Cæſar and Pompey. Varro has handed down to us a deſcription of theſe ſtews and the manner of making them: he ſays open places were choſen ſurrounded by water, that the ſnails might not abandon them, and care was taken that the places were not much expoſed to the ſun or to the dews. The ſtews were generally made under rocks or eminencies, whoſe bottoms were watered by lakes or rivers, and if a natural dew or moiſture was not found they formed an artificial one, by bringing a pipe to it bored full of holes, like a watering-pot, by which the place was continually ſprinkled or moiſtened The ſnails required little attention or food, for as they crawled they found it on the floor or area, and on the walls or ſides, if not hindered by the ſurrounding water. They were fed with bran, and ſodden lees of wine, or ſimilar ſubſtances intermixed with a few laurel leaves.

Pliny tells us there were many ſorts of theſe ſnails as whitiſh from Umbria, the large ſort from Dalmatia, the African kind, &c. Varro declares that ſome of theſe ſnails grew to a ſize ſo conſiderable, that one of their ſhells would contain ten quarts, but of what ſpecies theſe might be, we cannot venture to conceive. The helix pomatia is to this day uſed as food in many parts of Europe, eſpecially during Lent, and they are preſerved in ſtews for this purpoſe. In Italy they are commonly ſold in the markets, and are called bavoli, martinacci, and gallinelle. In France, ſays Liſter, they boil them in river water, and ſeaſoning them with ſalt, pepper, and oil, make a hearty repaſt; and this practice continues at the preſent period.

The helix pomatia is not an indigenous, but naturalized ſpecies in Britain, that has throve ſo well in our climate as to be found now in ſome parts in vaſt abundance. It was firſt imported to us from Italy, about the middle of the laſt century, by a *ſcavoir vivre*, as an article of food. Mr. Aubrey informs us, this was a Charles Howard, eſq. of the Arundel family, who, on that account, ſcattered and diſperſed thoſe ſnails all over the downs and in the woods at Albury, an ancient ſeat of that noble family; and alſo near Aſhted, Boxhill, Dorking, Epſom, and Surrey, where they have increaſed ſo greatly, that even the confines of Suſſex abounds with them. His example was followed by others in different parts of the kingdom, but by none with ſo much ſucceſs as by ſir Kenelm Digby, who diſperſed them about Gothurſt, the ſeat of that family near Newport-Pagnel, in Buckinghamſhire. Vide Br. Shells.

GLAUCA. Shell umbilicated, roundiſh, and pointed; lip margined; aperture oval. Knorr, &c.

Shell pale brown, with four tranſverſe darker bands; aperture yellowiſh. Native place unknown.

CITRINA. Shell ſomewhat umbilicated; convex, obtuſe, and yellowiſh, with a brown band. Linn.

Colour ſulphur, with one or two white bands, or a purple yellow, or reddiſh band joined to a white one; whorls five. The ſpecies inhabits the woods of Jamaica.

CASTANEA. Shell perforated, ſub-globular, dull cheſmut, with a rufous band united to a white one; whorls ſtriated. Chemn.

Shell pellucid, hard, and thick; whorls ſeven; aperture lunate. Country unknown.

RAPA. Shell perforated, ſub-globular, with hollow dots, and a red band; firſt whorl larger, and deflected inwardly above. Chemn.

Shell eight lines in diameter, white, and yellowiſh above.

GLOBULUS. Shell globular, ſub-umbilicated, and white; lip reflected. Liſt.

Glabrous, immaculate, and thickiſh, ſometimes ſlightly ribbed tranſverſely, with five whorls.

LACTEA. Shell imperforated, depreſſed, grey with white dots; aperture red-brown; lip the ſame colour, and denticulated. Chemn.

Inhabits Portugal.

INCISA. Shell depreſſed, umbilicated, and white, with cut margin. Favanne. Country unknown.

ARBUSTORUM. Shell umbilicated, convex, and pointed; aperture ſub-orbicular; and a little reflected at the rim; brown, with a ſingle black ſpiral band. Liſt.

Inhabits ſhrubberies and hedges of Europe; ſhell three quarters of an inch in diameter, the colour yellowiſh and brown ſpeckled, with a ſingle dark band; whorls about five.

FULVA. Shell nearly imperforate, globular, pellucid, fulvous, with a white lip. Müll.

Found in the marſhy woods of Denmark. Diameter from one to three lines; ſhell glabrous, and very finely ſtriated tranſverſely; aperture arched and narrow; whorls ſeven. Animal hyaline with black tentacula.

EPISTYLIUM. Shell ſub-imperforate, ſomewhat globular, ſtriated, white, with ſeven whorls. Liſt.

Shell twelve lines in diameter, hyaline, beneath flattiſh, and ſmooth; aperture lunate; lip reflected and poliſhed.

CINCTA. Shell ſub-imperforate, ſub-globular, white, with rufous lip and bands; whorls five. Müll.

Diameter eighteen lines. Country unknown.

LIGATA. Shell ſomewhat imperforate, and ſub-globular, white, with rufous bands; lip white; whorls four.

Native of Italy, and reſembles the former, but is ſmaller. The diameter fourteen inches.

ASPERSA. Shell ſub-imperforate, ſub-globular, pale

yellow, with four rufous bands interrupted with white ſpots; lip white. Müll.

Rough with minute impreſſed dots; whorls four; aperture elongated. Diameter from twelve to eighteen lines. This ſpecies inhabits Italy.

Extensa. Shell ſub-imperforate, ſub-globular, pale and immaculate; aperture large. Müll.

Diameter ſixteen lines, whorls four; the ſpecies reſemble helix pomatia, but the ſpire is leſs prominent.

Pisana. Shell perforated, globular, white, with ſomewhat interrupted red bands; lip roſy. Müll.

Inhabits Barbary and Italy. The ſpecies has five or ſix bands, and is from five to ſeven lines in diameter.

Nemorensis. Shell perforated, globular, and poliſhed, white with brown bands. Chemn.

Native of India; breadth fifteen lines, and reſembles helix memoralis, but is conſiderably larger, thicker, and harder; ſhell poliſhed and tinged with yellowiſh.

Strigata. Shell perforated, with the crown depreſſed, white with rufous bands, and numerous lines; lip white each ſide. Müll.

Shell poliſhed with ſlightly curved ſtriæ; diameter ten lines. The ſpecies inhabits Italy.

Zonaria. Shell umbilicate, convex, ſlightly depreſſed; aperture rather oblong and margined. Müll.

Native of Europe; the diameter from eleven to thirteen lines; colour whitiſh or yellow, with from one to ſix rufous bands; whorls five, the firſt very ventricoſe. A land ſpecies.

Hispida. Shell umbilicated, convex, hairy, and diaphanous; whorls five; aperture roundiſh-lunated. Linn. *Hiſpid or briſtly ſnail*, Donov. Br. Shells.

Breadth about half an inch, convex, gloſſy, very thin, and brown or horn colour. When the animal is alive the ſhell is of a dark red colour, approaching to black, and is very elegantly beſet all over with minute, ſhort, white briſtles, or hairs, which eaſily rub off when the animal dies. Found at the bottoms of trees, among moſs; in woods, and wet ſhady places.

Ericetorum. Shell umbilicated, depreſſed, and yellowiſh, with one or more fuſcous bands. Müll. *Cochlea compreſſa*, &c. Litter. *Helix albella*. Penn. *Heath ſnail*, Donov. Br. Shells.

Found on heaths and ſandy ſoils, and is very common in various parts of Europe. When full grown, this ſhell is three quarters of an inch in breadth, and one-third of an inch in height; the ſpire flat; outermoſt wreath very convex beneath, and the umbilicus central, large, and deep; mouth circular. The young ſhells are quite plain, whitiſh, or horn colour, and ſemi-tranſparent. In the adult ſtate marked with one or more ſpiral bands or lines of brown.

Arbustorum. Shell umbilicated and convex, with a ſingle dark ſpiral band; aperture ſomewhat orbicular; lip reflected. Donov. Br. Shells.—*Helix arbuſtorum*, Linn. —*Cochlea maculata*, &c. Liſt. *Cochlea unifuſciata*, Da Coſta.

A ſpecies about an inch in breadth or rather leſs, found in coppices and ſhrubberies in England, and other parts of Europe, but not very commonly; the colours, as in the ſpecies nemoralis and hortenſis, are variable, but it may pretty uniformly be diſtinguiſhed by the ſingle narrow ſpiral band. We have ſometimes met with it in woods.

Zonaria. Shell umbilicated, convex, rather depreſſed, and ſtriped; aperture rather oblong and margined. Linn. *Cochlea virgata*, Da Coſta. *Striped ſnail*, Donov. Br. Shells.

Inhabits dry ſandy heaths and banks. The diameter from half to three quarters of an inch; ſtripes or zones various.

Rufescens. Shell umbilicated, and ſtreaked with pale reddiſh. Donov. Br. Shells. *Cochlea dilute rufeſcens*, &c. Liſt. *Cochlea umbilicata*, &c. Da Coſta.

"This ſhell is about half an inch in diameter, and is readily diſtinguiſhed by a ſlight carination, or ridge that ſurrounds the firſt or largeſt wreath of the ſhell. The colour, as the name implies, is reddiſh when the animal is alive, and after its death whitiſh and diſcoloured; the carena is uſually paler than the reſt of the ſhell." Da Coſta ſpeaks of this ſpecies as being not very common, obſerving, at the ſame time, that he had received it from Cornwall and Hampſhire; and it is pretty frequent, he adds, about Leeſwood in Flintſhire, between the bark and wood of trees thrown down and decayed, the alders eſpecially. Dr. Liſter found it in plenty about Tadcaſter, &c.—"To this we ſhould add, that the ſpecies appears to be more frequent in many parts of Britain than is generally imagined. It delights chiefly in marſhy places." Br. Shells, v. 5.

Pallida. Shell inflated, ſlightly umbilicated, fragile, and pale; whorls ſix, and convex; aperture ſemi-lunar. Donov. Br. Shells.—*Helix cantiana*, Maton and Rackett. Linn. Tranſ.

Rather a local ſpecies found chiefly in Kent. It is ſaid to have been firſt noticed by Liſter as an inhabitant of that county. Since that period it has been met with at Spetiſbury in Dorſet, and Alton, Hants, by the Rev. Thomas Rackett; and by ourſelves at Caerwent in Monmouthſhire. Vide Donov. Tour South Wales.

Nitens. Shell umbilicated, ſub-depreſſed, fulvous horny, or yellowiſh green, pellucid, and ſub-ſtriated, aperture large. Gmel.

Inhabits damp woods of Europe. The ſhell brittle, thin, and pellucid; aperture ſemi-lunar, with an acute margin; whorls four or five.

Costata. Shell ſomewhat depreſſed, umbilicated, and cinereous; whorls ribbed; aperture circular, with a white reflected lip. Müll.

A rare ſpecies, found in the high lands of Denmark; diameter one line; ſhell rather convex, and opaque; whorls four, and tranſverſely plaited.

Pulchella. Shell umbilicate, and ſub-depreſſed; aperture circular; lip white and reflected. Geoffr. &c.

Found in the moiſt woods of Denmark; ſize of the laſt; whorls four; animal white.

Rotundata. Shell umbilicated and ſub-depreſſed, with elevated tranſverſe lines, and ſpots of ferruginous. Schroet. &c.

Inhabits ſame ſituations as the laſt, and is very common in France, Germany, and Denmark. Breadth two lines and a half; the ſhell white, beneath convex with ſquare ſpots, or ſometimes none; whorls from four to ſix; aperture arched, and without pillar lip. Animal white, with obſcure ſpots above, and black head and tentacula.

Cellaria. Shell umbilicate, depreſſed, yellowiſh, poliſhed, beneath white; aperture large. Schroet.

Breadth three lines and a half; ſurface glabrous, pellucid, beneath convex; whorls five; aperture lunated. Animal white, pellucid, with a black eye, and blue optic nerve. Inhabits Germany.

Obvoluta. Shell umbilicated, depreſſed both ſides; whorls obvolute. Müll.

Inhabits Italy and Thuringia. Diameter four or five lines.

Strigosula. Shell perforated, ſub-depreſſed, and ſtriated, white with a rufous band. Müll.

Breadth

Breadth five lines; ſhell convex, with about ſix whorls; lip thickiſh and white. Inhabits France.

RADIATA. Shell perforated, depreſſed, and ſtriated; beneath convex and radiated. Liſt.

Inhabits the South of France. This ſhell is thick, externally variegated with rufous and white, within white; aperture lunate, and without pillar lip.

LACUNA. Shell umbilicated, ſub-globoſe; whorls tumid and ſmooth, the firſt very ventricoſe; pillar ſinuate. *Helix lacuna*, Montagu.

A marine ſhell; length one quarter of an inch, thin, pellucid, and pale horny.

CRYSTALLINA. Shell perforated, depreſſed, gloſſy-white, and diaphanous. Müll.

A rare kind, found among moſs in Denmark; breadth a line, beneath convex; with from four to five whorls.

UNGULINA. Shell umbilicated and convex; the aperture margined, ſub-orbicular and elongated above. Linn. *Lapillus*, Rumpf. — *Planorbis indica*, Petiv.

Breadth ſixteen lines, and general form reſembling an apple; the ſhell yellowiſh, rufous, glabrous, and poliſhed; the upper part a little depreſſed, finely ſtriated tranſverſely; mouth purple and lip white. Native of India.

VARICA. Shell globular, umbilicated, and whitiſh-yellow; whorls contrary, the outermoſt divaricated. Müll.

Hard, rather pellucid, with five rounded whorls, the firſt ventricoſe; aperture with an acute margin. Breadth nineteen lines. Country unknown.

FRUTICUM. Shell globular and umbilicated; aperture without pillar-lip. Schroet.

Inhabits the hedges of Denmark and Thuringia; breadth ſeven lines and a half; ſhell rather pellucid, with ſix whorls; colour pale yellow, with ſcattered gold dots, or blackiſh ſpots and dots; ſometimes yellow with a purple band, or brown with black ſpots. Animal white, or various ſhades of black, and dark tentacula.

LUCENA. Shell ſub-globular, umbilicated, beneath gibbous; lip reflected and white. Chemn.

Shell pellucid glabrous, ſometimes entirely white, ſometimes yellowiſh above; whorls five, the firſt very convex; aperture lunate. Country unknown.

VITTATA. Shell ſub-globular and ſub-umblicated, white with crowded cheſnut bands, and blue crown; lip reflected and white. Chemn.

Inhabits Coromandel; the ſhell opaque, with a ligneous appearance, marked with concentric veins; whorls five; aperture black-brown, with an acute lip; diameter nine lines.

ROSACEA. Shell ſub-globular, and ſomewhat umbilicated; fleſh-coloured, and tranſverſely ſtriated; lip reflected and brown. Müll.

Reſembles H. pomatia, ventricoſe with five whorls, and lunate roſy aperture; breadth nineteen lines.

ITALA. Shell umbilicated, convex, and obtuſe, with five whorls; umbilicus wide; aperture ſub-orbicular, Gmel.

A terreſtrial ſpecies found in ſouthern Europe; ſhell the ſize of a nut, whitiſh, with a brown band.

LUSITANICA. Shell umbilicated, perforated, convex, obtuſe, with five rounded yellowiſh white whorls; umbilicus ſpreading. Gmel.

Inhabits ſame countries as the laſt; the ſpecies of one colour, and the ſize of a ſmall apple.

MAMMILLARIS. Shell umbilicated and ovate, with three ſtriated whorls; aperture ovate and united to the tip. Argenv.

Inhabits the rivers of Africa; the ſhell with fine tranſverſe crowded ſtriæ, and remoter longitudinal ones; aperture large.

HISPANA. Shell umbilicated, convex, with five round whorls; umbilicus thin and perforated; aperture ſub-orbicular. Gmel.

Native of Southern Europe; ſhell horn colour.

LUTARIA. Shell umbilicated, ovate-oblong, internally more coloured; aperture ſub-ovate. Linn.

Country unknown. The ſurface very finely ſtriated; umbilicus oblique; aperture white within.

OVALIS. Shell perforate, ovate, ventricoſe, and ſtreaked; tip ribbed, and with the lip roſy; pillar white. Chemn.

Length about four inches, thick, pale yellow, with roſy clavicles; whorls ſix; aperture oval.

OBLONGA. Shell perforated, ovate-oblong, and ſtriated, with lip and pillar roſy. Liſt. Seba, &c.

Native of South America and India. Length three inches, colour pale or yellowiſh-white, with ſix whorls; aperture oval. The animal cinereous, varied with lighter and darker ſhades, and ſtreaks tinged with blueiſh and roſe-colour. The eggs are covered with a hard calcareous ſhell, and in form reſemble thoſe of the ſparrow.

FLAMMEA. Shell perforated, oblong, and white with longitudinal rufous bands; pillar lip reflected and ſtraight. Adanſ.

Inhabits Guinea; the ſhell thin, pellucid, and glabrous, with waved bands, and eight or nine equally decreaſing whorls; lip gloſſy white.

PILEUS. Shell top-ſhaped, white, with rufous bands; aperture tranſverſe and large; lip a little reflected. Chemn.

Length fifteen lines; bands from three to five; whorls ſix. Country unknown.

NUCLEATA. Shell top-ſhaped, umbilicated, convex both ſides, brown, with prickly ribs; lip whitiſh. Chemn.

Inhabits the woods of Denmark. The ſhell ſub-pellucid, with four rounded whorls, on each of which are from twenty-eight to thirty whitiſh ribs; lip a little reflected and membranaceous. Animal hyaline, with head and tentacula black. Breadth three-fourths of a line.

VOLVULUS. Shell top-ſhaped, umbilicated, acuminated, and variegated; aperture circinated; lip reflected. Liſt..

Shell from eleven to twenty-two lines in breadth, the ſurface poliſhed, glabrous, and ſomewhat ſtriated; colour varied, yellow rufous and brown, with a broad deeper band.

INVOLVULUS. Shell top-ſhaped, umbilicated, and pointed; white, with ſpiral convex ſtriæ; aperture circinate; lip reflected. Born, &c.

Breadth thirteen lines, the ſurface very finely ſtriated longitudinally, and ſpotted and banded with rufous.

NÉRITINA. Shell glabrous, rather hard, and umbilicated; cheſnut with white bands; whorls flat beneath; aperture ovate-oblong. Kæmm.

Length an inch. The country unknown.

TURTURUM. Shell umbilicated, rounded, and thin, with a ſemi-lunar aperture. Liſt.

Inhabits the woods of Europe.

OLIVETORUM. Shell umbilicated, a little depreſſed, and yellow; aperture compreſſed; firſt whorl flattiſh round. Gualt.

Native of Florence, where it inhabits olive groves.

BADIA. Shell umbilicated, ſub-globular and ſmooth; above depreſſed; aperture lunar. Born.

Height one inch, the breadth an inch and a half; and the colour cheſnut.

CRETACEA. Shell ſomewhat umbilicated, ſmooth, whitiſh with brown bands; whorls convex; aperture lunated. Born.

Height ten lines, the breadth rather more than one inch.

PILEATA. Shell ſub-umbilicated and conic, white with cheſnut bands; aperture ſemi-lunar; tip obtuſe.

FUSCESCENS. Shell rounded, ſub-umbilicated, and thin, with a ſemi-lunar aperture. Schroet.

Colour brown, white, and margaritaceous, often barred with duſky. Inhabits Thuringia.

CREPUSCULARIS. Shell umbilicated, depreſſed and white, with ſix rounded whorls, the third and fourth brown, the laſt reddiſh at the tip; aperture ſemi-lunar and ſmooth. Martini.

Native of Guinea; ſolid, with a ſub-pyramidal ſpire.

TERRESTRIS. Shell umbilicated, with an obtuſely mucronate ſpire; the firſt whorl very large, the reſt gradually decreaſing; aperture ſemi-lunar, and margined. Schroet.

Dull fleſh-colour, or whitiſh with ſix whorls.

NIVEA. Shell rounded, umbilicated, thin, gloſſy-white; aperture ſemi-lunar. Schroet.

Reſembles the laſt, but is more rounded.

MEDIA. Shell flat both ſides, umbilicated, with ſix whorls, the firſt round; aperture ſub-orbicular. Schroet.

White, ſometimes barred with brown. Inhabits Germany.

TENELLA. Shell umbilicate, very thin, flat, poliſhed, and convex above; aperture ſemi-lunar and compreſſed. Schroet.

A land ſpecies; ſhell white, teſtaceous, horny, or margaritaceous; whorls five contiguous.

AVELLANA. Shell umbilicated, obtuſely ſub-triangular, rough, plaited, and ſilvery within; aperture ſmooth eared, the firſt whorl with an elevated circle. Spengl.

Size and colour of a nut, the pillar lip white. The ſpecies inhabits the Southern ocean.

RUFESCENS. Shell inflated, ſub-umbilicated, fragile, with five whorls, the firſt very large and ſub-compreſſed, the reſt convex: aperture ſemi-lunar. Schroet.

Inhabits the rivers of Hamburgh; breadth ſix lines, colour reddiſh with cheſnut ſpots.

PERVIA. Shell umbilicated, obtuſely ſub-pyramidal, with four convex whorls, the firſt with an elevated circle, the reſt with a groove; aperture ſemi-lunar. Schroet.

A minute ſpecies; the country unknown.

LÆVISSIMA. Shell umbilicated oblong, with ſmooth round whorls; aperture orbicular. Schroet.

Reſembles the laſt.

FASCICULARIS. Shell umbilicated and pellucid, with three whorls divided by a groove; aperture orbicular and without margin. Schroet.

Inhabits the waters of France, and is very rare; the ſhell broad and duſky; animal furniſhed with a creſt, and two tentacula.

TENNIS. Shell umbilicated, pellucid, horny, tranſverſely ſtriated and convex, with ſix gradually decreaſing whorls, and ſemi-lunar aperture. Shroet.

Diameter from four to five lines.

HOLOSERICEA. Shell umbilicated, depreſſed, a little concave above, the firſt whorls villous and flat; aperture triangular and margined. Gualt.

Inhabits the waters of France, Switzerland, and Thuringia. The breadth half an inch; whorls ſix; aperture with a reddiſh or white margin within.

TURGIDA. Shell thin, fragile, white, and umbilicated with fainter bands; firſt whorl round and inflated; aperture ſub-orbicular and not margined. Schroet.

Breadth three quarters of an inch; bands about eight; whorls ſix. The ſpecies inhabits the waters of Hamburgh.

CORIACEA. Shell cartilaginous, horny, pale yellow, ſub-pellucid, and gibbous; ſpire ſimple, with circular ſtriæ. Pallas.

Inhabits the Kurile iſlands. The ſpire covered with a calcareous cruſt within.

CORNU VENATORIUM. Shell depreſſed and deeply umbilicated. Chemn.

A terreſtrial ſpecies, found on the leaves and branches of trees in Senegal.

ELEGANS. Shell pyramidal, white, and umbilicated, with ſix acute flattiſh margined whorls. Favanne.

Native of Barbary and ſouthern Europe; a land ſpecies.

COOKIANA. Shell pyramidal, ſmooth white, and obtuſe, with a convex imperforated baſe. Chemn.

Inhabits the South Sea Iſlands.

BIDENTATA. Shell pyramidal, and ſub-carinated, banded and very minutely ſtriated with a two-toothed reflected lip. Chemn.

Found in the botanic garden at Straſburgh.

TURBO. Shell pyramidal and ſub-imperforate, varied with yellow and rufous. Chemn.

Native of Coromandel.

TRIFASCIATA. Shell conic-ovate, white with three brownish bands on the firſt whorl; aperture fringed with a dilated white lip. Liſt.

A land ſpecies found in Tranquebar.

BONTIA. Shell conic-ventricoſe, perforated, pellucid with a black tip; firſt whorl with three yellowiſh bands; aperture ovate. Chemn.

Shell very brittle. Native of Bengal.

TROCHOIDES. Shell top-ſhaped, perforated, poliſhed, longitudinally ſtriated; whorls contrary, the firſt carinated; aperture angular; pillar cheſnut brown. Chemn.

Country unknown.

TOMENTOSA. Shell umbilicated, with three briſtly whorls, and roundiſh aperture. Linn. Tranſ.

This and the four following are minute ſpecies found by Mr. Adams on the coaſt of Pembrokeſhire. H. tomentoſa is found in boggy ground.

FASCIATA. Shell ſub-umbilicated, with three longitudinally ſtriated whorls; the firſt more ventricoſe; aperture dilated. Linn. Tranſ.

Colour white, pellucid, with three dark belts, the middle one broadeſt. Sands at Tenby.

NITIDISSIMA. Shell umbilicated, with two whorls very finely ſtriated tranſverſely. Linn. Tranſ.

Horny, pellucid, with a brilliant gloſs.

BICOLOR. Shell ſlightly umbilicated, and ſmooth with two whorls. Linn. Tranſ.

Reſembles the laſt, but is ſmooth, and not gloſſy; within white.

TUBULATA. Shell with three longitudinally ſtriated whorls, and a margined tube at the baſe. Linn. Tranſ.

Probably not of this genus; the ſhell is ſaid to have a ſingular margined tube inſtead of umbilicus extending beyond the ſurface of the ſhell.

AMPULLACEA. Shell ſomewhat umbilicated, ſub-globular, and glabrous, the whorls more ventricoſe above; aperture very large, ovate oblong; umbilicus nearly covered Liſt. *Nerita*, &c. Müll.

Native of Aſia and America, and is from one to five inches in diameter, with the firſt whorl very large; the ſurface poliſhed, yellowiſh or brown, with a few bands in general; the animal edible.

PISCINALIS.

PISCINALIS. Shell globular, perforated, and reddiſh brown. *Nerita piſcinalis*, Müll.

Rather hard, opaque, very finely ſtriated tranſverſely, and the whorls four in number. The ſpecies inhabits fiſh-ponds in Denmark.

PUSILLA. Shell globular, perforated, greeniſh; aperture rolled ſpirally inwards. *Nerita puſilla*, Müll.

Reſembles the laſt except in being ſmaller, and inhabits the lakes of Germany.

SPHÆRICA. Shell globular, horny, with an obtuſe crown. Gmel. *Nerita ſphærica*, Müll.

Diameter from one to two lines; the ſhell white, or cinereous, immaculate, and glabrous, with four convex whorls, the firſt ventricoſe. Found in the ſeas of Denmark.

CORNUA ARIETIS. Shell umbilicate, flattiſh, with an oval aperture. Linn. *Planorbis contrarius*, Müll. *Cochlea marina compreſſa*, Liſter.

Shell an inch or rather more in diameter; white, with from three to ſeven bands of red; hard and finely ſtriated tranſverſely. Inhabits China.

CORNEA. Shell above umbilicated, flat, and blackiſh, with four rounded whorls. Linn. *Planorbis fluviatilis major vulgaris*, Petiv. *Flat whirl*, Grew. *Purpura*, Liſt. *Horny, or ram's horn ſnail*, Donov. Br. Shells.

The adult ſhells of this ſpecies are from three quarters of an inch to an inch and a quarter in diameter; the colours various, generally browniſh or aſhen colour, inclining in ſome to red, in others to yellow; the young ſhells are whitiſh and more tranſparent. It is very common in ponds and rivers in Europe. Helix nana or dwarf of Pennant is conſidered by Da Coſta and other conchologiſts as a young ſhell of this ſpecies.

The animal of this ſpecies is blackiſh, and emits a fine ſcarlet dye, if a grain of ſalt or pepper be put into the mouth of the ſhell; and this may be obtained at any ſeaſon of the year, but in the greater perfection in April and September. This is deſcribed at length by Dr. Liſter. The ſcarlet humour, he ſays, may be readily got, and in large quantity, if a large parcel of theſe ſhells be wrapt up in a cloth bag, and ſprinkling over it a little ſalt, which will cauſe the ſcarlet liquor to ooze out plentifully. This colour, it is aſcertained however from repeated experiment, is ſo evaneſcent that no acid or aſtringent has been hitherto found ſufficient to preſerve the elegance of its tint. Vide Britiſh Shells, vol. 2.

SPIRORBIS. Shell concave each ſide, flat, whitiſh, with five rounded whorls. Martini.

Found in the waters of Europe, eſpecially thoſe of France and Germany. The ſhell is a line and a half in diameter, pellucid, yellowiſh, and obſoletely ſtriated; whorls four or five; aperture ſlightly labiated.

POLYGYRA. Shell flattiſh and orbicular; aperture oval; lip fringed. Born.

Country unknown.

CONTORTA. Shell thick, ſomewhat umbilicated and flattiſh; aperture narrow and creſcent-ſhaped. Donov. Br. Shells. *Helix contorta*, Linn. *Tiney many-circled, thick, river cheeſe ſhell*, Petiv. *Planorbis craſſa*. &c. Da Coſta.

An aquatic ſpecies, lately found in the river Thames. Da Coſta miſtook it for the Linnæan helix complanata. The ſhell is rare, the colour whitiſh, or clouded with brown, and the diameter about a quarter of an inch. Animal grey, with tentacula edged with white.

NITIDA. Shell poliſhed, yellowiſh, above convex, umbilicated, beneath flat, and perforated. Mart.

Length from one to three lines in diameter; the ſhell brown in general, diaphanous, and highly poliſhed; whorls from three to five, the outermoſt much broader than the reſt; aperture heart-ſhaped. Animal black, the tentacula white at the tip. Inhabits ditches in Denmark.

ALBA. Shell white, umbilicated each ſide; aperture dilated. Martini.

Found on aquatic plants in Denmark. The ſhell is pellucid, flattiſh above, beneath convex; whorls four, round, the outer larger than the reſt, and the whole decuſſated with fine ſtriæ; aperture large and oblique. The animal grey, with white tentacula, and black eyes.

SIMILIS. Shell pellucid, umbilicated above, and ſtriated with dots. Martini.

Inhabits the ditches of Berlin and Denmark.

*** *Shell angulated each ſide.*

SCARABÆUS. Shell ſomewhat umbilicate, ovate, with both edges carinated; aperture toothed. *Helix ſcarabæus*, Linn. *Helix* (*pythia*) Müll. *Cochlea imbrium*, Rumpf.

Length an inch and a half, the colour white and brown variegated; whorls contiguous, the firſt convex; aperture narrow, compreſſed, and rather flexuous; lip three-toothed, the outer lip acute and unequal. Inhabits mountains in Aſia.

**** *Whorls with a carinated acute margin.*

LAPICIDA. Shell umbilicated, and convex each ſide; aperture tranſverſe, margined and ovate. Linn. Müll. Donov. Br. Shells, &c.

Found in woods, hedges, the bodies of old trees and ſtones in Britain and ſome other parts of Europe. The ſhell is reddiſh horn colour, with whitiſh and ferruginous marks; whorls five; umbilicus pervious. The diameter of the ſhell about half an inch.

MARGINATA. Shell ſomewhat umbilicated, and a little depreſſed, obliquely ſtriated with rufous bands; aperture tranſverſe. Müll.

Native place unknown. This ſpecies is convex above, beneath flattiſh; whorls four and glabrous, the firſt with three bands, the reſt with two; aperture ſub-triangular.

CICATRICOSA. Shell umbilicated, ſomewhat depreſſed, wrinkled, and yellowiſh with concentric rufous lines; whorls contrary. Müll.

Shell thin and pellucid, above convex, beneath gibbous: whorls five; the outermoſt with rufous bands; umbilicus pervious; aperture nearly ſquare, within white. Diameter three quarters of an inch. Country unknown.

ÆGOPHTHALMOS. Shell umbilicate, a little depreſſed, greeniſh, without ſpots, and with ſeven whorls. Gmel.

Shell horny, finely ſtriated, and ſlightly carinated when young; umbilicus pervious; aperture lunate; mouth white. Diameter one inch. The ſpecies inhabits India, Barbary, and South America.

OCULUS CAPRI. Shell ſomewhat carinated, umbilicated, and convex; aperture margined. Argenv.

Shell glabrous, whitiſh, with the centre brown; whorls rather depreſſed, and yellowiſh brown; aperture white, beneath yellow. Inhabits trees in Aſia.

MACULATA. Shell perforated, flattiſh, ſub-carinated, white dotted with brown, beneath gibbous, with linear bands Müll.

Whitiſh with two bands of brown dots; whorls three. Diameter rather leſs than half an inch. Country unknown.

ALBELLA. Shell umbilicated and flattiſh, beneath gibbous; aperture ſomewhat heart-ſhaped. Linn.

A ſmall ſpecies, being about five lines and a half in length, found on rocks and dry ſandy banks of Europe; the ſhell is glabrous and white, without ſpots; whorls five; rounded on the outſide, and very finely ſtriated tranſverſely.

ALBINA.

ALBINA. Shell perforated, flattiſh, and white, beneath gibbous; aperture quadrangular. Müll.

Reſembles H. albella, and may be only a variety of that ſpecies: the whorls are three, and the diameter one-fourth part of an inch.

STRIATULA. Shell ſub-carinated, umbilicated, convex, and ſtriated, beneath more gibbous; aperture roundiſh lunulate. Gmel.

Grey or whitiſh, and very finely ſtriated tranſverſely; whorls four or five. A ſmall ſhell, found, according to Brander, in the waterfalls of Lombardy.

ALGIRA. Shell ſomewhat angular, umbilicated, and convex, with ſix whorls; umbilicus pervious. Favanne.

Native of Mauritiana. The ſpire of the ſhell has ſix whorls, which are obſoletely angulated; the perforation much dilated.

LEUCAS. Shell ſub-carinated, umbilicated, convex, and ſmooth; beneath gibbous; umbilicus very minute; aperture roundiſh lunate. Gmel.

Shell whitiſh, with a purple band above and lines of the ſame beneath. The ſpecies is found in Africa.

EXILIS. Shell perforated, depreſſed, and ſub-carinated, pale with a rufous band united to a white one; whorls ſtriated. Chemn.

Native of Tranquebar; the ſhell pellucid, thin, beneath convex; whorls five, aperture with an acute margin. Diameter 10 lines.

LÆVIPES. Shell perforated, ſub-depreſſed, and ſomewhat carinated contrary; pale with a rufous band united to a white one. Müll.

Country unknown; the ſhell pellucid, thin, beneath more convex; whorls five, very finely ſtriated tranſverſely; aperture with an acute margin. Diameter three quarters of an inch.

VERMICULATA. Shell ſub-globoſe, depreſſed, rough, and imperforated; dotted with white, with four browniſh bands; lip reflected and white. Chemn.

Inhabits Italy and Luſitania.

CANDIDA. Shell umbilicate, each ſide convex; aperture not margined. Kæmmer.

Reſembles lapicida, but is thinner; the height five lines, breadth ten lines; umbilicus narrower. Country unknown.

SPADICEA. Shell perforated and ſub-depreſſed, umbilicated and cheſnut, with five whorls. Gmel.

Height ſeven lines, breadth 11; umbilicus and margin of the lip whitiſh. Country unknown.

INCARNATA. Shell perforated, ſub-globoſe, ſomewhat carinated and horny; whorls ſix; lip fleſh colour. Müll.

A rare ſpecies, about ſix lines in length, found in the woods of Denmark and Germany: this ſhell is immaculate, with a pale edge and very narrow perforation.

CRENULATA. Shell perforated, globoſe, ſub-carinated, ſtriated, and white with a brown band. Liſt.

Inhabits Lyons. Shell three lines and a half wide; the tip brown; lip acute; whorls five in number.

SERICEA. Shell perforated, ſub-globoſe, ſomewhat carinated, each ſide convex and downy. Müll.

Native of Denmark, where it inhabits gardens: the ſhell is horny, tranſparent, with a pale ridge, and three lines in diameter.

PLANORBIS. Shell ſub-carinated, umbilicated, flat, above concave; aperture oblique, ovate, and acute each ſide. Linn. Donov. Br. Shells.

A ſmall ſpecies of a pellucid horny colour that inhabits the ponds and rivers of Europe; the whorls are from four to five in number, the firſt much larger than the reſt.

COMPLANATA. Shell carinated downwards, umbilicated, and convex, beneath flat; aperture ſemi-cordated. Müll. Donov. Br. Shells.

Like the laſt, inhabits watery places: the animal black with rufous tentacula; ſhell brown, ſub-pellucid, and very finely ſtriated tranſverſely; whorls five or ſix. Native of Europe.

RINGENS. Shell ſub-carinated, imperforated, and convex, with an inverted ringent aperture; lip four-plaited behind. Gmel.

A rare ſpecies, found in India; the breadth an inch and a half; colour yellowiſh-brown, or cinereous, with ferruginous ſpots, or white with ſpots of brown; aperture oblong-oval, with from four to eight paits; whorls about ſix.

LUCERNA. Shell imperforate, white, above flattiſh, beneath gibbous; aperture tranſverſe and bidentated. Müll.

The native place of this ſpecies is unknown; the breadth rather exceeds an inch; the colour white, ſurface not ſtriated, and the whorls much depreſſed.

SINUATA. Shell imperforate, ſub-carinated, and brown; carina white; aperture dentated, tranſverſe, and three-plaited behind. Müll.

This ſhell is roughiſh, flattiſh both above and beneath, with five roundiſh whorls, and reflected. It inhabits America, and is about nine lines in diameter.

LAMPAS. Shell imperforate, above flattiſh, beneath gibbous; whorls cicatrized, the outermoſt divaricate. Müll.

A rare ſpecies, 31 lines in diameter; the ſurface finely ſtriated, fulvous, with a whitiſh ridge and yellowiſh mouth: lip orange, glabrous, and very much reflected; whorls four, broad, and flattiſh.

CAROCOLLA. Shell imperforate, a little convex each ſide, with tranſverſe white lip. Müll.

Reſembles the laſt, but ſcarcely exceeds half its ſize: the ſhell uſually cheſnut with black rays, ſometimes white beneath, or white intermixed with pale yellow, or blackiſh with whitiſh lip; whorls five or ſix, ſub-convex, with ſomewhat triangular aperture. A land ſpecies found in India.

LYCHNUCHUS. Shell imperforate and top-ſhaped; white with fulvous bands; aperture tranſverſe and bidentated. Liſt.

Country unknown. Shell with a double band on the upper part of the whorl.

CEPA. Shell ſub-globular, umbilicated, ſub-carinated, yellowiſh with a whitiſh band; aperture tranſverſe, bidentated, and ſinuate behind. Liſt.

Diameter half an inch; ſhell convex each ſide, with five contiguous whorls; aperture lunated; lip a little reflected; pillar lip reflected and thick.

CORNU MILITARE. Shell ſub-carinated, imperforated, and convex; aperture with a wide margin. Gualt.

A land ſpecies of rather conſiderable ſize, found in India; the ſhell is glabrous, white covered with a brown ſkin; whorls obtuſe; aperture fulvous, with a brown border.

PELLIS SERPENTIS. Shell ſub-carinated, with bands of flame colour, and white, beneath ſurrounded with four rows of dots; aperture fringed. Favanne.

Inhabits the warmer parts of America.

VORTEX. Shell carinated; above ſlightly convex, beneath flat; aperture oval. Donov. Br. Shells. *Helix vortex*, Linn. *Cochlea exigua quinque orbium*, Liſt. *Planorbis polygirata minor*, Petiv. *Whirl*, Penn. *Planorbis*, Da Coſta. *Common whirl ſhell.*

Flat, thin, and rather more than one-third of an inch in diameter; the colour whitiſh. Frequent in ſtagnant waters.

SCABRA. Shell ſomewhat carinated, imperforate, ovate, pointed, and ſtriated. Gmel.

Native

Native place unknown; ſhell with brown divided bands, the lower whorl with an elevated line.

Gothica. Shell convex each ſide, horny, with ſub-ferruginous bands. Gmel.

Inhabits the woods of Sweden.

Gualteriana. Shell imperforate, and depreſſed, with decuſſate ſtriæ; aperture at each ſide acute. Gmel.

A land ſpecies found in India; the colour dirty white or grey; beneath convex; aperture triangular and caniculate, the border white.

Tricarinata. Shell top-ſhaped, ſomewhat umbilicated, and acuminated with convex ſpiral ſtriæ and triple ridge; aperture dilated. Müll.

Native place unknown; ſhell nearly an inch wide; the colour pale with tranſverſe yellow ſtreaks and obſolete ſpiral ſtriæ; whorls five; aperture nearly circular; lip white with an acute margin.

Isognomostomos. Shell browniſh and depreſſed, the firſt whorl round; aperture contracted, nearly triangular, three-toothed, and margined. Lift.

Inhabits Virginia and Alſace; ſhell nearly imperforate.

Oculus communis. Shell depreſſed and umbilicated; whorls contiguous, the firſt very large; aperture oblong-ovate, with a pale fulvous border within. Gmel.

Native place unknown. Shell large, ſolid, fleſh-colour, grey, or alternately browniſh and yellow, with generally ſix or more bands of brown or blueiſh; whorls ſix, the outermoſt mucronate; aperture compreſſed; the operculum red on the outſide, knotty and gloſſy.

Punctata. Shell ſub-umbilicated, ſomewhat carinated, a little depreſſed and rounded; whorls round; aperture tranſverſe oblong, with a margined three-toothed lip; pillar thickened, and emarginate. Born.

This ſhell is brown, with narrow tranſverſe yellow bands on the back, and dotted rays towards the future. Country unknown.

Affinis. Shell umbilicated, and convex each ſide, variegated white and cheſnut; aperture winged and ſlightly margined. Born.

Native place unknown.

Marginella. Shell umbilicated, obliquely ſtriated, above convex, beneath a little depreſſed; firſt whorl carinated; aperture triangular tranſverſe margined. Born.

Breadth an inch and a half, height two-thirds of an inch; colour white with a brown band.

Sinuosa. Shell ſomewhat carinated and imperforated, convex each ſide, with hollow dots; whorls ſub-convex and contiguous; aperture tranſverſe and beſet with ſeven teeth. Born.

Shell with ſix whorls. Country unknown.

Maculosa. Shell umbilicated, ſub-carinated, obliquely ſtriated, and a little depreſſed, beneath convex; aperture lunate, with a margined lip. Born.

White with fulvous ſpots. Country unknown.

Vitrea. Shell ovate, and ſomewhat umbilicated; glabrous, and ſemi-pellucid; whorls five, the firſt gibbous, the reſt carinated; aperture oblong-ovate. Born.

Height two inches; yellowiſh brown, with longitudinal waved ſulphur bands. Native place unknown.—Obſ. In Linn. Tranſ. vol. 8., another ſhell is deſcribed under the name of helix vitrea. The latter is the turbo vitrea of Montagu, and will be referred by us to the turbines, from a perſuaſion that the ſhell is rather of the turbo than helix genus.

Annulata. Shell umbilicated, a little depreſſed and white; whorls four, the firſt gibbous and bicarinated. Schroet.

Shell two lines in diameter, with an ovate aperture.

Rhenana. Shell umbilicated and white; above depreſſed; whorls carinated, with irregular ſtriæ, the laſt brown. Schroet.

Found in the Rhine.

Corrugata. Shell umbilicated, wrinkled, obliquely ſtriated, and grey; aperture lunated; lip fleſh colour, and reflected within. Lift.

Native of Jamaica.

Nævia. Shell rather depreſſed, umbilicated, white, with longitudinal black ſpots above, and five bands beneath. Chemn.

Inhabits Santa Cruz.

***** *Ovate and imperforated.*

Amarula. Shell imperforated, oblong, with ſpinous toothed whorls. Linn. *Buccinum (teſta ſubovata nigra, &c.)*, Müll. *Voluta fluviatilis*, Rumpf.

From half an inch to about an inch in length; colour black, immaculate, with ſpiral ſub-convex ſtriæ, and five or ſix whorls, each of the whorls on the upper part armed with ten ſharp ſpines; aperture large, wide and white; outer lip acute; inner one thick.

Pupa. Shell nearly imperforated, ovate-oblong, and coarſe, with ſix whorls, and lunated oblong aperture. Brander.

Twice the ſize of a barley-corn, and inhabits Mauritania.

Barbara. Shell imperforated, oblong, and coarſe, with eight whorls, and roundiſh lunate aperture.

Inhabits Algira, and is half the ſize of the former.

Nævia. Shell tranſverſely grooved, white, with blackiſh ſtriæ; ſpire pointed, with flattiſh whorls, the firſt larger and round. Kemm.

Rather more than an inch long, and inhabits the Southern ocean.

Aspera. Shell-pointed, cinereous, and tranſverſely ſtriated; whorls toothed and marked with red ſtreaks. Chemn.

Inhabits the maritime marſhes of Coromandel; length from five to eight lines; ovate, pellucid, ſometimes dirty grey-brown, with convex ſpiral ſtriæ, and undulated, longitudinal, tuberculated ſtreaks; whorls ſeven or eight, each armed with 12 ſpines; aperture ovate; outer lip acute, inner one gloſſy brown; throat pale with pellucid punctured red ſtreaks.

Stagnalis. Shell imperforated, ovate, tapering to a point; ſomewhat angular; aperture oblong-oval. Linn. *Turbo ſtagnalis*, Da Coſta. *Lake ſnail*, Donov. Br. Shells.

The largeſt and moſt produced of the Britiſh river ſnails, and is found in plenty in moſt lakes, ponds, and other ſtill waters. The length is an inch and a half, or ſometimes more when full grown. Liſter and Petiver make two ſpecies of this ſhell, maximum and minus, both being of the ſame kind in different ſtages of growth.

Fragilis. Shell imperforated, ovate, tapering round, pellucid; aperture oblong-ovate. Linn. *Brittle river ſnail*, Donov. Br. Shells.

Found on plants in rivulets, and ſtill waters in Europe. Length from an inch to an inch and a quarter, the colour whitiſh, aperture not margined, and often yellowiſh; the firſt wreath ventricoſe. Gmelin ſuggeſts that helix fragilis is probably only a variety of helix ſtagnalis, an opinion conſidered erroneous (in Brit. Shells,) "helix fragilis being clearly diſtinguiſhed from helix ſtagnalis, and one or two other analogous ſpecies of river ſnails by the number of ſlight ridges which ſpirally traverſe the whole ſhell in the former,

former, and which are in particular obvious on the firſt wreath: it is likewiſe more uniformly elongated than H. ſtagnalis, the primary whorl being leſs ſwollen, and the remainder more ſo than in that ſhell." Vol. 5. This ſpecies is not common.

FONTINALIS. Shell imperforated, ovate, pointed, glabrous, horny; volutions five, the firſt and ſecond ventricoſe. *Smooth freſh-water ſnail*, Donov. Br. Shells, vol 5. 171.

A new ſpecies found in ſome rivulets in Devonſhire: reverſed ſhells of this kind occur ſometimes with the others.

PUTRIX. Shell imperforated, obtuſe, ovate, yellow: aperture ovate. Linn. *Helix ſuccinea*, Müll. *Trianfractus, three-ſpired*, Da Coſta. *Helix patris, mud-ſnail*, Donov. Br. Shells.

This is remarkably fragile, pellucid, and membranaceous; with three whorls, the firſt very large, the other two ſmall; aperture without lip. Length about an inch or rather leſs; colour variable, generally yellowiſh. This ſhell is very common in muddy ditches, ponds, and other watery places, and eſpecially in thoſe overgrown with weeds.

BULLAOIDES. Shell ovate, ſmooth, gloſſy, horny, brittle; whorls reverſed; ſpire ſhort. Donov. Br. Shells.

"Received from Lincolnſhire by the late ducheſs of Portland, from whoſe collection the ſpecimen at this time in our poſſeſſion was obtained. It is a new ſpecies, and apparently of the aquatic kind, but we are entirely unacquainted with its hiſtory." Vol. 5. 168.

GLABRA. Shell cylindrical, pointed, and horny, with an ovate aperture. Schroet.

Length four lines and a half, pellucid, with about eight round whorls, the firſt with a kidney-ſhaped tranſparent black belt. Animal black with whitiſh horns. Inhabits moiſt meadows in Denmark.

TRUNCATULA. Shell ovate-oblong, the whorls truncated upwards; aperture ovate. Schroet.

Inhabits Greece; length from one to five lines; ſhell black, ſomewhat pellucid, with five whorls, and incumbent ſqualid lip.

PEREGRA. Shell horny and ſub-conic, with an acute projection; aperture ovate. Gualt.

Length from two to eight lines, and inhabits the ſtagnant waters of Denmark. Shell pellucid and whitiſh, or ſometimes dark.

GLUTINOSA. Shell ventricoſe, with an obtuſe projection: aperture wide. Gmel. *Buccinum peregrum*, Müll.

Found in Denmark, chiefly on the leaves of the nymphæa lutea; length from one to four lines; ſhell brittle, thin and yellow with two or three whorls, and rounded aperture. Animal white dotted with cinereous dots, and furniſhed with a gelatinous membrane, covering the ſhell.

ACUTA. Shell conic-pointed, white with a red band; aperture toothleſs. Liſt.

Inhabits Italy; length four lines; ſhell with ſeven whorls, and ſometimes two red bands on the larger whorl; aperture ovate.

PAPILLA. Shell conic, perforated, with rugged ſtriæ; aperture tranſverſe; lip reflected. Chemn.

Breadth ten lines and a half; ſhell varied with white and reddiſh brown wrinkles; whorls about ſix, and convex; aperture ovate with a thick white lip.

MINUTA. Shell ſub-cylindrical, with an oval toothleſs aperture. Müll.

Reſembles turbo muſcorum, but is much more linear and pointed; whorls five. Native of Greece.

DETRITA. Shell conic, white, with tranſverſe, rufous lines, and ovate aperture. Gualt.

Inhabits Saxony; ſhell eight lines and a half long, poliſhed, and obſoletely ſtreaked; whorls ſix, the lip a little reflected at the pillar.

VENTRICOSA. Shell conic, pale and ſtriated; aperture toothleſs. Müll.

Length two lines; whorls ſeven, the four outermoſt very nearly of equal width. Inhabits Greece.

OBSCURA. Shell conic, brown; aperture toothleſs; lip white. Liſt.

Inhabits Europe, at the roots of trees; ſhell pointed and finely ſtriated; whorls ſix; aperture oval, with an acute margin; lip gloſſy white. Animal white, above duſky, eyes black.

LUBRICA. Shell conic, fulvous, poliſhed, pellucid, and acute; aperture toothleſs; lip reddiſh. Liſt.

Lives among moſs and wet rotten wood in Europe; the length two lines and a half; ſhell glabrous, finely poliſhed, rarely whitiſh with five or ſix whorls, and ovate aperture. Animal black, beneath white.

LIMOSA. Shell imperforated, ſomewhat oblong, pellucid and acute, with an ovate aperture. Chemn.

Inhabits wet meadows of Europe.

CONTORTUPLICATA. Shell turbinated, cinereous, nearly imperforated; crown truncated. Gmel. *Nerita contorta*, Müll.

Found in muddy ditches in Europe; length two lines and a half; ſhell pyramidal, ſqualid, and opaque; whorls about five; aperture circinated.

ANGULARIS. Shell imperforated and greeniſh; the whorls ſpirally angular; throat white. Liſt. *Nerita angularis*, Müll.

Native of China; length twelve lines; ſhell conic, very finely ſtriated tranſverſely; whorls five, nearly perpendicular; aperture rounded.

BALTHICA. Shell imperforated, ovate and pointed, with elevated wrinkles; aperture ovate and dilated. Linn.

Inhabits the ſhores of the Baltic; ſhell pellucid, with four whorls. Animal black with two tentacula.

NERITOIDEA. Shell imperforated, convex, and longitudinally ſtriated, cleft umbilical; aperture roundiſh. Linn.

Livid, with about forty ſtriæ.

PERSPICUA. Shell imperforated, convex, and ovate, without lip; aperture extending to the tip. Linn.

Allied to the bulla genus; the ſhell milk white, tranſparent, and very brittle. Inhabits the Mediterranean.

HALIOTOIDEA. Shell imperforated, depreſſed, with waved ſtriæ; aperture oval, and open to both ends. Linn. *Bulla velutina*, Müll.

Cloſely allied to the genus haliotis; the ſhell elliptic, thin, pellucid, white, or reddiſh with a white band, or orange with two paler bands, ſlightly cancellated outwardly: whorls four and placed laterally; lip very acute. Animal ſmall, white with two ſhort tentacula; operculum none.

MURALIS. Shell imperforated and ſub-depreſſed, white with ſix whorls. Schroet.

Breadth ſix lines; ſhell pellucid, convex each ſide, with a thickiſh white lip. Inhabits France.

TENTACULATA. Shell imperforated, ovate, obtuſe, the ſpire ſub-conic; aperture rather oval. Donov. Br. Shells. *Helix tentaculata*, Linn. *Cochlea parva pellucida*, &c. Liſt. *Cochleola, &c. ſmall freſh-water turbo with five wreaths*, Petiv. Wallis, &c. *Turbo nucleus*, Da Coſta. *Kernel, or olive water ſnail.*

Length from one quarter to one-third of an inch; ſhell horny, diaphanous, glabrous, and variable from whitiſh to brown, or reddiſh; operculum ovate, horny, and pellucid white.

AURICULARIA. Shell imperforated, ovate, gibbous, with a narrow depreſſion in the middle of the lip; ſpire acute and very ſhort; aperture very much dilated. Linn. *Buccinum ſub-flavum*, &c. Liſt. *Turbo patulus*, Da Coſta. *River ear ſnail*, Donov. Br. Shells.

Length in the adult ſtate about an inch and a quarter, the colour whitiſh yellow, or browniſh, the inſide pure white. Animal white, with cinereous dots and black eyes. Inhabits ponds in Europe.

LÆVIGATA. Imperforated, pellucid, roundiſh, of two wreaths, the firſt very large, the ſecond ſmall, obtuſe, and placed laterally. Donov. Br. Shells. *Helix lævigata*, Linn. *Smooth ſnail.*

A marine ſpecies rarely found on the coaſts of Britain.

LUTEA. Shell imperforated and ſub-oval; aperture patulous, and oval. Maton and Rackett, Linn. Tranſ.—*Helix lutea*, Montagu.

Length half an inch, breadth one quarter, ſmooth and ſomewhat pellucid; whorls ſcarcely three, the firſt ample, Perhaps a marine ſpecies.

VERTIGO. Shell cylindrical, glabrous, obſcure and fulvous; whorls round, and contrary aperture nearly ſquare, and ſix toothed. Gmel. *Vertigo puſilla*, Müll.

Inhabits Denmark, in decayed wood; length one line; ſhell with four or five whorls. Animal pellucid, above blueiſh, beneath white, with two linear tentacula bearing each an eye at the tip.

PYRUM. Shell ſub-cylindrical, with decuſſate ſtriæ, hyaline with cheſnut marks and brown at the tip; whorls contrary, three of them large, and depreſſed in the middle. Martini.

Spire with ſeven whorls. This ſpecies inhabits Guinea.

CARYCHIUM. Shell hyaline, ſub-conic, glabrous; aperture ovate, with about three teeth within. Gmel. *Carychium minimum*, Müll.

Native of Denmark, among rotten leaves; length leſs than one line; whorls five and rounded. Animal yellow, with two truncated tentacula having each an eye at the baſe.

CARTUSIANA. Shell imperforated, ſub-depreſſed, and white; whorls ſix. Müll.

Inhabits France; ſhell pale; diameter ſix lines; lip white and rather thick.

AMBIGUA. Shell ſub-imperforated and convex, with remote compreſſed grooves; aperture ſemi-orbicular. Adanſ.

Small, white, and reſembling a nerita, except that the inner lip is not reflected; with the umbilicus open in the younger, and cloſed in the adult ſhells; ſpire lateral and obtuſe, ſurrounded with ſix elevated grooves. Inhabits the Mediterranean.

CORVUS. Shell imperforated, ovate, and black; aperture ovate. Martini.

Inhabits the ſtagnant waters of Greece, and reſembles helix ſtagnalis, but is only half the ſize, and leſs pointed, the firſt whorl not ſo ventricoſe, and the lip leſs prominent.

MARMORATA. Shell marbled with white, cinereous, and blue; form obtuſe; whorls round; the firſt twice as long as the reſt, inflated in the middle and longitudinally ſtriated; aperture ovate. Schroet.

Length three quarters of an inch; whorls five. Found in the rivers of Straſburgh.

ACHATINA. Shell cheſnut pellucid, and thin, with an ovate aperture. Schroet.

Reſembles the laſt, but is leſs, and has only four narrower whorls.

LUGUBRIS. Shell ovate, pointed, and pellucid. tranſverſely ſtriated, ochraceous with cheſnut undulations, and covered with a black ſkin; firſt whorl twice as large as the reſt; aperture oblong ovate. Schroet.

Length nine lines; whorls ſeven.

MINIMA. Shell ovate, conic, and ſub-imperforated; aperture orbicular; two laſt whorls placed in the centre of the firſt. Schroet.

INFLATA. Shell white, ſolid, and opaque, the firſt whorl twice as large as all the reſt; aperture large and margined. Schroet.

Found in the river Inſtrut, in Thuringia.

ALBICANS. Shell white, opaque, and pointed; aperture oval. Schroet.

Inhabits the waters of Hamburgh.

REPANDA. Shell ovate, pointed, and ſub-imperforated; firſt whorl ventricoſe and larger than all the others; aperture ſemi-circular. Schroet.

Lives in ſtagnant waters. Shell from ſix to ſeven lines long.

OPACA. Shell ovate, pointed, ſolid, whitiſh, and opaque; aperture ovate oblong; firſt whorl larger than the reſt. Schroet.

An aquatic ſpecies, with about five whorls.

TURGIDA. Shell obtuſe, with four diſtant whorls inflated in the middle; aperture orbicular, margined. Schroet.

Length two lines.

CÆRULESCENS. Shell blueiſh, ovate, and pointed, with ſomewhat ventricoſe whorls; aperture oblong and rounded. Schroet.

Inhabits Frankfort; length two lines; whorls four.

CINEREA, Shell inflated with four ſhort whorls, the two lower ones diſtant; aperture oblong and without margin. Schroet.

Native of Alſace; length two lines.

UNDATA. Shell imperforated, oblong, white, with longitudinal red undulations; firſt whorl of the ſpire thrice as large as the next; aperture ovate. Gualt.

Length an inch and a quarter; whorls ſix or ſeven.

TESTA. Shell imperforated, oblong, thin, and brown; firſt whorl ovate, and thrice as large as the next; aperture ovate. Gault.

Shell with four whorls.

SUBSTRIATA. Shell ſub-imperforated, and oblong; very finely ſtriated with white; firſt whorl twice as large as the next; aperture oval and margined. Gualt.

Length a quarter of an inch; the whorls five.

TRIGONOSTOMA. Shell ſmooth and brown, with a triangular margined aperture. Gualt.

A minute ſpecies, the country unknown.

TUMIDA. Shell ventricoſe, pointed and cinereous; firſt whorl larger than all the reſt; aperture oval, large, and margined on one ſide. Gualt.

Length one inch and a quarter, with a white band at the pillar.

ACICULA. Shell oblong, pointed, longitudinally ribbed and tranſverſely ſtriated; aperture oval. Schroet.

Length a quarter of an inch; ſhell ſtriped between the ribs with cheſnut, and covered with a black ſkin; whorls ten, equally decreaſing. Inhabits Coromandel.

TURBINATA. Shell oblong, imperforated, ſmooth, pointed; whorls inflated, the firſt much larger, the reſt gradually decreaſing; aperture ſub-oval, margined. Marſigl.

Length three inches and a half, and inhabits the Danube.

DANUBIALIS. Shell oblong, imperforated, with diſtant ventricoſe whorls; aperture orbicular. Marſigl.

Length three inches and a half, and inhabits the Danube.

DANUBIALIS. Shell oblong, imperforated, with diſtant ventricoſe whorls; aperture orbicular. Marſigl.

More ventricoſe than the laſt; length two inches and a half; inhabits the Danube.

CURVATA. Shell oblong, curved, ſub-imperforated, with an oval margined aperture. Marſigl.

Length two inches and a half, and inhabits the Danube.

EXILIS. Shell thin, ſmooth, white, with cheſnut bands; ſpire obtuſe, with flattiſh whorls Kæmm.

Varies in length from ſix lines to one inch; native place uncertain.

COCCINEA. Shell ovate and imperforate, ſmooth, and red, with a pale yellow aperture. Mart.

Native of New Zealand.

AFRA. Shell imperforated, and ovate, with ſix flattiſh contiguous whorls; aperture unequal and five-toothed. Adanſ.

Native of Senegal; length three lines; colour pale, fulvous or whitiſh, the firſt whorl much larger than the reſt.

NUCLEUS. Shell imperforated, ovate, glaucous, and ſtriated tranſverſely with black belts; aperture ſinuous. Mart.

Inhabits Otaheite.

****** *Shell tapering.*

DECOLLATA. Shell imperforated and tapering; ſpire truncated. Liſt.

Inhabits Europe, Aſia, and Africa; length from 10 to 15 lines; ſhell whitiſh, oblong, poliſhed, and ſub-ſtriated; whorls from four to ſeven, the firſt nearly twice the ſize of the reſt.

SCALARIS. Shell conic, tapering, imperforated, with remote whorls; aperture ovate. Chemn.

Native place unknown; ſhell obliquely ſtriated, pale rufous with two whitiſh bands; ſpire obtuſe, with five ventricoſe whorls.

CIRCINATA. Shell hyaline, tranſverſely ribbed, perforated, and rather tapering; whorls diſtant; aperture circular. Kæmm.

Height ſix lines; breadth ſeven lines and a half; lip acute.

SUBCYLINDRICA. Shell imperforated, tapering, ſubcylindrical obtuſe, with four whorls and ovate aperture. Chemn.

Inhabits freſh waters of northern Europe; ſize of a grain of rye, horny, pale, with a very obtuſe lip; interior margin of the aperture reflected.

TENERA. Shell tapering, convex, and ſtriated; white with a few fulvous ſtreaks; pillar ſinuate and inflected. Chemn.

Length two inches and a half, thin, pellucid, longitudinally ſtreaked; whorls ſeven or eight, margins incumbent; aperture ovate-oblong.

COLUMNA. Shell tapering, white with a fulvous tip, and ſpotted contrary whorls; aperture oblong. Favanne.

Country uncertain; length 27 lines and a half; ſhell in pellucidity and colour reſembling alum.

PELLA. Shell imperforated, ovate, pointed, and tranſverſely ſtriated; brown with yellow bands. Müll.

Native of Iceland; ſhell ruſty brown, decumbent, ovate-oblong; band on the firſt whorl double, on the reſt ſingle; aperture ſemi-ovate.

PLICARIA. Shell ſubulate, ſemi-pellucid, and longitudinally plaited; whorls round; aperture ovate. Born.

Whorls ten. Country unknown.

UNDULATA. Shell ſubulate, ſmooth, very finely ſtriated tranſverſely; whorls round; aperture ovate. Born.

Pale, with longitudinal cheſnut undulations; whorls twelve; pillar glabrous.

STAGNORUM. Shell ſub-imperforate, a little tapering, with five whorls and ovate aperture. Gmel.

Inhabits freſh waters; ſize of a barley-corn.

LACKHAMENSIS. Shell ſomewhat perforated, oblong-ovate; aperture ſub-rotund-lunate; margin reflected.—*Helix lackhamenſis*, Montagu.

Found at Lackham, and Bow-wood, Wilts. Length five-eighths of an inch; breadth one quarter of an inch; colour ſordid brown.

OCTANFRACTA. Shell imperforated, tapering, and ſomewhat ſtriated; whorls eight; aperture ovate. Maton and Rackett, Linn. Tranſ. *Helix octona*, Penn.

Length five eighths of an inch; breadth one quarter. Found in ponds.

FOSSARIA. Shell imperforated and ſub-ovate; whorls five or ſix, and rounded; future conſpicuous; aperture ovate. Maton and Racket, Linn. Tranſ. *Helix foſſaria*, Montagu.

Inhabits ſtagnant waters; length three-eighths of an inch, breadth one eighth.

FUSCATA. Shell ſubulate, ſmooth, and very finely ſtriated tranſverſely; whorls round; aperture ovate. Born.

Yellowiſh-brown, the mouth cinereous; whorls about ten; pillar ſmooth.

PRIAPUS. Shell imperforated, tapering, and glabrous, with inflected pillar, and ſomewhat depreſſed whorls. Gronov.

Colour bay with four dotted bands, the firſt whorl thrice as large as the reſt; aperture ovate.

FOLLICULUS. Shell tapering, pellucid glabrous, with ſomewhat plaited pillar-lip thin. Gronov.

Size of an oat, white, with five or ſix round whorls of equal ſize; aperture ovate.

SEPIUM. Shell tapering, milk-white, longitudinally ſtriated, with ſeven contiguous whorls; aperture ovate. Martini.

Inhabits the mountains of ſouthern Europe; length half an inch; ſhell ſometimes marked with longitudinal grey lines.

SPLENDIDULA. Shell thin, gloſſy, and pellucid, pale brown with an oblong aperture. Gmel.

Native of France and Thuringia; about a quarter of an inch long; ſpire with ſix whorls.

MITRA. Shell tapering, with diſtant ribbed whorls, the firſt round, the reſt flattiſh; aperture oval. Schroet.

Length an inch, thin and whitiſh, with eight or nine whorls.

CUSPIDATA. Shell tapering and horny, very finely ſtriated tranſverſely, and longitudinally plaited; aperture oval; lip acute. Liſt.

Inhabits rivers of India.

ATRA. Shell tapering, black, and very minutely ſtriated, with rather convex whorls, and oblong-oval aperture. Gualt.

Length two inches; whorls ſeven.

CRENATA. Shell tapering, white, ſub-ſtriated tranſverſely, and ſurrounded with a crenulated belt near the future. Chemn.

Inhabits rivers of India.

CARINULA. Shell tapering, ſub-umbilicated and white; the firſt whorl ſub-carinated, with blackiſh bands. Chemn.

CROCEA. Shell cylindrical glabrous, yellowiſh-orange, with an obtuſe tip. Chemn.

LANSCHAURICA. Shell rather tapering, very glabrous, cheſnut brown with darker ſpots; throat whitiſh. Chemn.

Found in the freſh waters of Coromandel.

OBTUSATA.

OBTUSATA. Shell white, denſely ſtriated, and ſub-cylindrical; whorls a little convex; lip margined. Kæmm.

Length three inches.

PURPUREA. Shell ovate-oblong, purpliſh, teſſellated with darker purple; within irideſcent. Gmel.

Native of New Zealand.

HELIX, in *Geometry*, a ſpiral line. See SPIRAL.

The word is Greek, ἑλιξ, and literally ſignifies a *wreath*, or *winding*; of ἑλισσω, *involvo*, *I environ*.

In *Architecture*, ſome authors make a difference between the helix and the ſpiral.

A ſtair-caſe, according to Davila, is in a helix, or is helical, when the ſtairs or ſteps wind round a cylindrical newel; whereas the ſpiral winds round a cone, and is continually approaching nearer and nearer its axis.

HELIX, in *Natural Hiſtory*, is a term applied by Dr. Grew, ("Rarities at Greſham College, p. 260, 261.) to ſeveral ſpecies of CORNU *ammonis*, which ſee.

HELIXANTHERA, in *Botany*, is derived from ἑλιξ, *a ſcrew*, on account of its ſpiral-ſhaped anthers. Loureir. Cochinch, v. 1. 142.—Claſs and order, *Pentandria Monogynia*.

Gen. Ch. *Cal.* Perianth cylindrical, truncated, coloured, propped by an ovate, fleſhy ſcale of the ſame colour as the calyx. *Cor.* of one petal, ſuperior; tube ſhort; limb in five deeply-divided, reflexed, oblong, obtuſe ſegments; nectary with five ſides, five-cleft at the top, forming an arch over the ſtyle. *Stam.* Filaments five, thread-ſhaped, inſerted into the mouth of the corolla; anthers linear, ſpirally revolute. *Piſt.* Germen oblong, concealed by the calyx; ſtyle equal with the ſtamens; ſtigma thickiſh. *Peric.* Berry formed out of the calyx, oblong-ovate, containing an ovate *ſeed*.

Eſſ. Ch. Calyx oblong, truncated. Corolla five-cleft. Anthers ſpiral-ſhaped. Berry formed out of the calyx, containing a ſingle ſeed.

1. *H. paraſitica*. Loureir.—It creeps over the ſtems of cultivated trees in the gardens of Cochinchina.—*Stem* paraſitical, woody, long, branched. *Leaves* lanceolate, ſmooth, entire, undulated, bent back at the top. *Flowers* ſmall, in long, ſimple, axillary, ſcarlet ſpikes. *Calyx* and *Berries* of the ſame ſcarlet colour.

Such is Loureiro's account. We have ſeen no ſpecimens of this plant, but part of his deſcription ſeems to indicate an affinity to *Baſella*.

HELL, a place of puniſhment, wherein the wicked are to receive the rewards of their evil deeds after this life.

In this ſenſe *hell* ſtands oppoſed to *heaven*.

Among the ancients hell was called Ταρταρος, Ταρταρα, *Tartarus*, *Tartara*; Ἀδης, *Hades*, *Infernus*, *Inferna*, *Infera*, &c. See TARTARUS and ADES. See alſo ELYSIUM.

The Jews, wanting a proper name for it, called it *Gehenna* or *Gehinnon*, from a valley near Jeruſalem, wherein was a Tophet, or place where a fire was perpetually kept. See GEHENNA.

Divines reduce the torments of hell to two kinds; *pœna damni*, the loſs and privation of the beatific viſion; and *pœna ſenſus*, the horrors of darkneſs, with the continual pains of fire inextinguiſhable.

Moſt nations and religions have their notions of a hell. The Greeks borrowed their notions of the infernal regions from the Egyptians. To this purpoſe Diodorus Siculus informs us (l. i. c. 36.), that the puniſhments of the wicked in Tartarus, the manſions of the bleſſed in the Elyſian fields, and ſome other ſuch notions, are evidently borrowed from the funeral rites of the Egyptians. Mercury, the conductor of ſouls, among the Greeks, was formed on the model of a man, to whom the ancient Egyptians uſed to commit the care of Apis's dead body to carry it to another, who received it under a maſk with three heads like thoſe of Cerberus. It is ſaid that the whole fable of the infernal regions was introduced into Greece by Orpheus. See ELYSIUM.

The hell of the poets is terrible enough, witneſs the puniſhment of Tityus, Ixion, Theſeus, Tantalus, Prometheus, the Danaids, Lapithæ, Phlegyas, &c. deſcribed by Ovid in his Metamorphoſis. Virgil, after a ſurvey of hell, Æneid, lib. vi. declares, that if he had a hundred mouths and tongues, they would not ſuffice to recount all the plagues of the tortured.

Accordingly he thus deſcribes the manſions of the dead:

"Deep, deep, a cavern lies, devoid of light,
All rough with rocks, and horrible to ſight:
The gaping gulph inclos'd with ſable floods,
And the brown horrors of ſurrounding woods.
From her black jaws ſuch baleful vapours riſe,
B'ot the bright day, and blaſt the golden ſkies;
That not a bird can ſtretch her pinions there,
Through the thick poiſons and incumber'd air;
O'ertook by death her flagging pinions ceaſe,
And hence Aornus was it called by Greece.
Hither the prieſteſs four black heifers led,
Between their horns the hallow'd wine ſhe ſhed;
From their high front the top-moſt hairs ſhe drew,
And in the flames the firſt oblations threw, &c."

Pitt's Æneid, vi. 332.

Again,

"At hell's dread mouth a thouſand monſters wait:
Grief weeps, and *Vengeance* bellows in the gate:
Baſe *Want*, low *Fear*, and *Famine*'s lawleſs rage.
And pale *Diſeaſe*, and ſlow repining age;
Fierce, formidable fiends! the portal keep;
With *Pain*, *Toil*, *Death*, and Death's half-brother *Sleep*.
There *Joys* embittered with *Remorſe* appear;
Daughters of *Guilt!* here ſtorms deſtructive *War*.
Mad *Diſcord* there her ſnaky treſſes tore;
Here ſtretch'd on iron beds, the *Furies* roar.
Full in the midſt a ſpreading elm diſplay'd
His aged arms, and caſt a mighty ſhade.
Each trembling leaf with ſome light viſion teems,
And heaves impregnated with airy dreams,
With double forms, each *Scylla* took her place
In Hell's dark entrance, with the *Centaur*'s race;
And cloſe by *Lerna*'s hiſſing monſter, ſtands
Briareus dreadful with a hundred hands,
There ſtern *Geryon* raged; and, all around,
Fierce *Harpies* ſcream'd, and direful *Gorgons* frown'd."

Ibid. 385.

The rivers of hell, according to the poets, were Acheron, Phlegethon, Cocytus, and Styx; which ſee reſpectively. The three infernal judges were Minos, Eacus, and Rhadamanthus, who were appointed to this office on account of their ſtrict probity. The infernal gods were Pluto, Ceres, Proſerpine, and Cottytta. To theſe have been added Night, Sleep, and Death. Although neither temples nor altars were erected to theſe divinities, nor hymns compoſed to their honour; yet ſome worſhip was paid to them, with a view of appeaſing their anger, and preventing their doing miſchief.

The New Teſtament repreſents hell as *a lake of fire and brimſtone*, and *a worm which dies not*, &c. (Rev. xx. 10, 14, &c. Mark, ix. 43, &c. Luke, xvi. 23, &c.) The Caffres

are-

are ſaid to admit thirteen hells, and twenty-ſeven paradiſes; where every perſon finds a place of recompence ſuited to the degree of good or evil he has done.

There are two great points of controverſy among writers concerning hell: the firſt, whether there really be any local hell, any proper and ſpecific place of torment by fire? the ſecond, whether the torments of hell are to be eternal? 1. The locality of hell, and the reality of the fire thereof, have been controverted from the time of Origen. That father, in his treatiſe Περι Αρχων, interpreting the ſcripture account metaphorically, makes hell to conſiſt not in external puniſhments, but in the conſcience of ſinners, the ſenſe of their guilt, and the remembrance of their paſt pleaſures. St. Auguſtine mentions ſeveral of the ſame opinion in his time; and Calvin, and many of his followers, have embraced it in our's.

The retainers of the contrary opinion, who are much the greateſt part of mankind, are divided as to the ſituation and other circumſtances of this horrible ſcene. The Greeks after Homer, Heſiod, &c. conceived hell, τοπον τινα ὑπο την γην μεγαν, &c. *a large and dark place under the earth.* Lucian, De Lucta; and Euſtathius, on Homer.

Some of the Romans lodged it in the ſubterranean regions directly under the lake Avernus, in Campania; which they were led to from the conſideration of the poiſonous vapours emitted by that lake. Through a dark cave near this lake Virgil makes Æneas deſcend to hell. See AVERNI.

Others placed hell under Tenarus, a promontory of Laconia; as being a dark frightful place, beſet with thick woods, out of which there was no finding a paſſage. This way, Ovid ſays, Orpheus deſcended to hell. Others fancied the river or fountain of Styx, in Arcadia, the ſpring-head of hell, becauſe the waters thereof were deadly.

But theſe are all to be conſidered as only fables of poets, who, according to the genius of their art, allegorizing and perſonifying every thing, from the certain death met with in thoſe places, took occaſion to repreſent them as ſo many gates or entering places into the other world. The primitive Chriſtians, conceiving the earth a large extended plain, and the heavens an arch drawn over the ſame, took hell to be a place of the earth, the fartheſt diſtant from the heavens; ſo that their hell was our antipodes.

Tertullian, De Anima, repreſents the Chriſtians of his time as believing hell to be an abyſs in the centre of the earth; which opinion is chiefly founded on the belief of Chriſt's deſcent into *Hades, hell*, Matt. xii. 40. See the following article HELL and ADES.

Mr. Whiſton has advanced a new opinion. According to him, the comets are to be conceived as ſo many hells, appointed in the courſe of their trajectories or orbits, alternately to carry the damned into the confines of the ſun, there to be ſcorched by his flames; and then to return them to ſtarve in the cold, dreary, dark regions, beyond the orb of Saturn.

Mr. T. Swinden, in an expreſs enquiry into the Nature and Place of Hell, not contented with any of the places hitherto aſſigned, contends for a new one. According to him the ſun itſelf is the *local* hell.

This does not ſeem to be his own diſcovery: it is probable he was led into the opinion by that paſſage in Rev. xvi. 8, 9. Though it muſt be added, that Pythagoras ſeems to have had the like view, becauſe he places hell in the ſphere of fire, and that ſphere in the middle of the univerſe. Add, that Ariſtotle mentions ſome of the Italic or Pythagoric ſchool, who placed the ſphere of fire in the ſun, and even called it Jupiter's Priſon. De Cœlo, lib. ii.

Swinden's arguments for the ſun's being the local hell are,

1. Its capacity. Nobody will deny the ſun ſpacious enough to receive all the damned conveniently; ſo that there will be no want of room. Nor will fire be wanting, if we admit of Mr. Swinden's argument againſt Ariſtotle, whereby he demonſtrates that the ſun is hot, p. 108, & ſeq. The good man is "filled with amazement to think what Pyrenean mountains of ſulphur, how many Atlantic oceans of ſcalding bitumen, muſt go to maintain ſuch mighty flames as thoſe of the ſun; to which our Ætna and Veſuvius are mere glow-worms." p. 137.

2. Its diſtance and oppoſition to the empyreum, which has uſually been looked upon as the local heaven: ſuch oppoſition is perfectly anſwerable to that oppoſition in the nature and office of a place of angels and devils, of elect and reprobate, of glory and horror, of hallelujahs and curſings; and the diſtance quadrates well with Dives ſeeing Abraham *afar off, and the great gulf between them*, which this author takes to be the ſolar vortex.

3. That the empyreum is the higheſt, and the ſun the loweſt place of the creation, conſidering it as the centre of our ſyſtem; and that the ſun was the firſt part of the viſible world created, which agrees with the notion of its being primarily intended or prepared to receive the angels, whoſe fall he ſuppoſed to have immediately preceded the creation.

4. The early and almoſt univerſal idolatry paid to the ſun; which ſuits well with the great ſubtilty of that ſpirit to entice mankind to worſhip his throne.

Againſt this hypotheſis it may be objected, that we muſt admit a vaſt number of hells, if, as this author himſelf allows, the fixed ſtars be ſuns; and it ſeems extremely improbable, that as ſoon as a ſyſtem is created, an abode of torment ſhould be prepared for its inhabitants.

Others, by adopting a direct counterpart to Mr. Hallet's hypotheſis concerning heaven (ſee HEAVEN), have imagined that the earth would be the ſeat of future puniſhment, and that when left in the flames of the laſt conflagration, wicked men would be caſt down into it, alleging a peculiar propriety in making that the place of their puniſhment which was the ſcene of their iniquity. On this ſubject, however, we muſt be content to remain in ignorance and indeciſion.

Heaven and hell, as they are uſed in ſcripture, ſeem to be ſtrongly figurative terms, and to denote more a ſtate or condition of being, than a place; but if we maintain their locality, it does not ſeem to be improbable that they ſhould not be very remote from the preſent habitation of mankind; and poſſibly they may conſtitute diſtinct ſocieties, ſeparated from each other by an impaſſable boundary. But the world of ſpirits, however firmly we may believe their preſent and future exiſtence, and the various capacities they poſſeſs and operations they perform, is to us at preſent a kind of "terra incognita," or unknown world.

II. As to the eternity of hell-torments, we have Origen, again, at the head of thoſe who deny it: it being the doctrine of that writer, that not only men, but devils themſelves, after a ſuitable courſe of puniſhment anſwerable to their reſpective crimes, ſhall be pardoned and reſtored to heaven. (Aug. De Civit. Dei. lib. xxi. cap. 17.) The chief principle Origen went upon was this, that all puniſhments are emendatory; applied only as painful medicines, for the recovery of the patient's health. And other objections inſiſted on by modern authors are the diſproportion between temporary crimes and eternal puniſhments, &c.

The ſcripture phraſes for eternity, as is obſerved by archbiſhop Tillotſon, do not always import an infinite duration: thus, in the Old Teſtament, *for ever* often ſignifies only a long time, particularly to the end of the Jewiſh diſpenſation: thus, in the epiſtle of Jude, ver. 7. the cities of Sodom

and

and Gomorrah are ſaid to be ſet forth for an example, ſuffering the vengeance of *eternal fire*; that is, of a fire that was not extinguiſhed till thoſe cities were utterly conſumed. So one generation is ſaid to come, &c. but the earth endureth *for ever*.

In effect, M. Le Clerc notes, that there is no Hebrew word which properly expreſſes eternity: עולם, *holam*, only imports a time whoſe beginning or end is not known; and is accordingly uſed in a more or leſs extenſive ſenſe according to the thing treated of.

The Greek and Hebrew words tranſlated *eternal*, *everlaſting*, and *for ever*, though they do not denote an abſolute eternity, nor are uſed in this ſenſe in the N. T. the LXX, or Pagan authors, generally, however, repreſent a long duration; and this is ſometimes limited by the context, or nature of the ſubject, ſometimes not. According to this interpretation the puniſhments of the wicked will be of long duration; but one might rather conclude from the words of the original, ſays Dr. Hartley, (Obſ. on Man. prop. cxciv.), if their derivation be conſidered, that they will end at the expiration of ſome long period, than that they will be abſolutely eternal.

Archbiſhop Tillotſon, however, argues very ſtrenuouſly, that where hell-torments are ſpoken of, the words are to be underſtood in the ſtrict ſenſe of infinite duration; and what he eſteems a peremptory deciſion of the point is, that the duration of the puniſhment of the wicked is in the very ſame ſentence expreſſed by the very ſame word, which is uſed for the duration of the happineſs of the righteous, which all agree to be eternal. "Theſe, ſpeaking of the wicked, ſhall go away, εις κολασιν αιωνιον, *into eternal puniſhment*; but the righteous, εις ζωην αιωνιον, *into life eternal*."

The ſame great author attempts to reconcile this eternity with the divine juſtice, which had not been ſatisfactorily done before. Some had urged, that all ſin is infinite, in reſpect of the object againſt whom it is committed, *viz.* God; and therefore deſerves infinite puniſhment: but, that crime ſhould be heightened by the quality of the object to ſuch a degree, is abſurd; ſince the evil and demerit of all ſin muſt be equal, inaſmuch as none can be more than infinite; and conſequently there can be no foundation for degrees of puniſhment in the next life. Add, that for the ſame reaſon as the leaſt ſin againſt God is infinite, in reſpect of its object, the leaſt puniſhment inflicted by God may be ſaid to be infinite, becauſe of its author; and thus all puniſhments from, as well as ſins againſt God, would be equal. Whereas both ſcripture and reaſon prove, that there are different degrees of guilt, proportionable to the different circumſtances attending them. To this conſideration it has been replied, that where the *duration* of the puniſhment is equal, there may be ſuch a difference in the *degree*, as may be correſpondent to the degree of the crime: and if this anſwer be not allowed to be ſatisfactory, it will be difficult to ſay how the doctrine of different degrees of eternal rewards can be vindicated as conſiſtent with itſelf.

Others have urged, that if the wicked were to live for ever they would ſin for ever; but this, ſays the author, is mere preſumption. Who can ſay, that if a man lived ever ſo long, he would never repent? Beſides, the juſtice of God only puniſhes ſins which men have committed, not thoſe they poſſibly might have committed.

Others therefore urge, that God gives men the choice of everlaſting happineſs and miſery; and that the reward promiſed to obedience is equal to the puniſhment threatened to diſobedience. To which it has been anſwered, that though it be not contrary to juſtice to exceed in rewards, that being matter of mere favour, it may be ſo to exceed in puniſhments.

It may be added, that a man in this caſe has nothing to complain of, ſince he has only his election. But though this may ſuffice to ſilence the ſinner, and make him acknowledge his deſtruction to be of himſelf, it does not ſatisfy the objection from the diſproportion between the crime and the puniſhment. All the conſiderations, therefore, hitherto alleged, proving ineffectual, our great author is left to ſolve the difficulty himſelf.

In order to this he obſerves, that the meaſure of penalties, with reſpect to crimes, is not only, nor always, taken from the quality and degree of the offence, much leſs from the duration and continuance of it; but from the reaſons of government, which properly require ſuch penalties as may ſecure the obſervation of the law, and deter men from the breach of it. Among men it is not reckoned injuſtice to puniſh murder, and many other crimes, which perhaps are committed in a moment, with perpetual loſs of eſtate, or liberty, or life; ſo that the objection of temporary crimes being puniſhed with ſuch long ſufferings is of no force.

In effect, what proportion crimes and penalties are to bear to each other, is not ſo properly a conſideration of juſtice, as of wiſdom and prudence in the lawgiver, who may enforce his laws with what penalties he pleaſes, without any impeachment of his juſtice, which is out of the queſtion.

The primary end of all threatening is not puniſhment but the prevention of it: God does not threaten that men may ſin, and be puniſhed; but that they may not ſin, and ſo eſcape: and therefore the higher the threatening runs, the more goodneſs there is in it.

After all, it is to be conſidered, ſays the good archbiſhop, that he who threatens has ſtill the power of the execution in his own hands. There is this difference between promiſes and threatenings; that he who promiſes, paſſes over a right to another, and thereby ſtands obliged to him, in juſtice and faithfulneſs, to make good his word: but it is otherwiſe in threatenings; he that threatens, keeps the right of puniſhing ſtill with him, and is not obliged to execute what he has threatened, any farther than the reaſons and ends of government require. Thus, God abſolutely threatened the deſtruction of Nineveh, and his peeviſh prophet underſtood the threatening to be abſolute, and was angry for being employed in a meſſage that was not made good; but God underſtood his own right, and did what he pleaſed, notwithſtanding the threatening he had denounced, and notwithſtanding Jonah was ſo touched in point of honour, that he had rather have periſhed than Nineveh ſhould have eſcaped. Tillotſon's Sermons, vol. i. p. 411. ed. fol. 1710.

To this reaſoning it has been replied, that where God has not only forbidden any ſinful action on ſuch a penalty, but has expreſsly declared that he will execute that penalty, and that he will not ſuſpend the execution of it on any condition; though we could not ſay his *faithfulneſs* would be impeached by acting in a different manner, yet it would be hard to vindicate his *veracity*, eſpecially ſince he muſt know, even when he publiſhed the threatening, that it would not be executed, without the greateſt injury offered to the moral perfections of his nature. It alſo ſeems inconſiſtent with his *wiſdom* to have pronounced ſuch threatenings as theſe, and yet to have given mankind reaſon to believe that he will not and cannot execute them, which this objection ſuppoſes he has given; for a threatening, which the perſon threatened knows another cannot fulfil, is the vaineſt and moſt contemptible thing one can imagine: and it is worth obſerving, that Matt. xxv. 41. 46. is ſuch a *prediction* of a future and moſt ſolemn fact, as cannot with any decency be ſuſpected, and yet on

this

this hypothefis cannot be accounted for. Piſtorius, in his notes on "Hartley's Obſervations on Man," expreſſes his opinion, that by ſuppoſing that the threats of eternal puniſhment will not be executed in the utmoſt rigour of the words by which they are expreſſed, but that God has a right, like human legiſlators, to mitigate the ſeverity of his puniſhments according to circumſtances, we diſparage God's truth, and conſequently weaken the grounds on which our truſt in his word muſt be built. It will therefore be of no avail, as he thinks, to make a diſtinction between threats and promiſes, and to maintain that theſe muſt be certain and determinate, but that thoſe may be altered by the ſubſequent reſolves of God: and he conceives that the compariſon of human legiſlators and magiſtrates is not applicable to the preſent caſe. If we were once to admit that the intent of the divine threatenings is not equally ſtrict with the expreſſion, and that a mitigation of them may be expected, we ſhould be reduced to a dangerous uncertainty, which would greatly favour the hope of abſolute impunity; or, at leaſt, it would much weaken the impreſſion of the threats of puniſhment, and conſequently militate againſt the end for which they are deſigned. This writer, however, ſuggeſts, that theſe threats of eternal puniſhment, which are expreſſed in an unconditional and unlimited manner, may be underſtood in a conditional and limited ſenſe, without doing violence to the words, and without ſapping the foundations of God's truth. It may be ſuppoſed that eternal puniſhments are threatened to ſin and ſinners; that is, to the former as long as it is practiſed, or, as long as it exiſts; to the latter ſo far as they are ſinners, or ſo far as they continue to offend againſt the deſigns and ordinances of their creator. If the divine threats may be underſtood, with this limitation, it would not follow, that puniſhment muſt endure to all eternity, if, in ſome portion of eternity, ſin would ceaſe, and be annihilated, and the ſinner be ſome time converted. It may be ſaid they relate to ſin, and preſume its actual exiſtence. They concern the ſinner ſo far as he is a ſinner. If, then, he ceaſe to be ſo, it would ſeem that his puniſhment muſt alſo ceaſe. There are parallel modes of expreſſion in ſcripture, which appear to favour this interpretation. See 1 John, v. 18. Thus, it is ſaid with regard to the wicked, "the wrath of God remaineth upon him," with the limitation, that the wicked remain objects of God's wrath as long as they are wicked. See alſo, 1 Cor. vi. 9, 20: ſee alſo the paſſage above referred to, reſpecting the Ninevites. In ſimilar caſes, we may expect every thing from the mercy of God, and that his threats may be conditionally underſtood, when they are unconditionally expreſſed.

If it be aſked, why theſe threats were unconditionally ſpoken, and why this condition was not clearly expreſſed in words, it may probably be anſwered; an unconditional threat may make a deeper impreſſion on the mind of a ſinner, excite a terror that will be more efficacious for being united with doubt and anxiety, and thus produce a more earneſt repentance, in thoſe who require for their amendment a ſtrong ſenſe of terror. It is not difficult to perceive that the threats of eternal miſery, uttered in the ſcriptures againſt ſin and ſinners, are moſt ſuitably and efficaciouſly expreſſed in an unconditional manner. The inſtructions of ſcripture are confined to the teaching us, how we muſt lead our lives here, to ſecure happineſs hereafter. They extend not to a future life; they tell us not how we muſt conduct ourſelves in it: they only aſſure us, that we ſhall be in it what we are fitted for by our conduct in the preſent life, and that it will be a ſtate of the moſt juſt and adequate retribution of the works we perform, and the diſpoſition we cultivate here. They teach us, that he who oppoſes the order and purpoſes of his wiſe and benevolent creator will be the object of puniſhment and wretchedneſs, and that an oppoſition to the ordinances of God will be attended with eternal miſery. The ſcripture teaches us, that in the future world, the virtuous will be happy, and the wicked miſerable, without any commixture of circumſtances tending to weaken the proper fate of each. The queſtions, however, whether the good may there become worſe, or the wicked better; and what alterations the deſtiny of either would, in that caſe, undergo; on which, according to this ſtate of the caſe, reſts the whole doctrine of the future ſtate of the bleſſed, and of the damned, it leaves to be anſwered by philoſophy.

On the other hand, it has been alleged, as we have already obſerved, that eternal puniſhments for finite offences are inconſiſtent with the juſtice of the Divine Being. Moreover, it is ſaid to be inconſiſtent with the *goodneſs* and *mercy* of God, to give exiſtence to a number of rational creatures, who, he ſaw, would be eternally miſerable, and to leave them in ſuch circumſtances, as thoſe in which it is plain they are left, if all who die impenitent paſs into everlaſting torment. To this argument it has been replied, that God has given his intelligent and moral offſpring ſufficient means for ſecuring everlaſting happineſs, ſo that this miſery is to be charged not upon him but upon themſelves. It has alſo been ſuggeſted, that the everlaſting miſery of ſome ſinful creatures may be the moſt effectual means of exhibiting and maintaining, in mutual harmony, all the divine attributes and the character of God as a moral ſovereign, and the majeſty and honour of his government. Beſides, if we comprehend within our ſurvey the whole extent of the divine government, in its relation to other habitable worlds, as well as to our earth, the number of wicked and miſerable beings may bear a ſmaller proportion to that of the good and happy than a grain of ſand does to the whole body of the ſun. But it is further objected, that however minute and inconſiderable our rank, number, or figure in the creation may be, if God intended man for happineſs, as he certainly did in the original conſtitution of his nature, it would be inconſiſtent with his *wiſdom*, to ſuffer his main end to be fruſtrated, in the eternal miſery of the greater part of the ſpecies. To this objection it has been anſwered, that we do not know that the greater part of mankind are eternally miſerable; as *perhaps* all infants may be ſaved, and ſuch univerſal virtue may hereafter prevail, for ſucceeding, and thoſe very long-lived and fruitful generations, as ſhall turn the balance of number, even among the *adult*, on the ſide of religion and happineſs; and ſome have even queſtioned, whether it is proper to ſay, that the ultimate end of God in the creation of man was the final happineſs of the greater part of the ſpecies.

Dr. Hartley (ubi ſupra) obſerves, that if the eternity of future puniſhment be a doctrine of the Chriſtian religion, it is ſo eſſential, that it could not have been omitted by any inſpired writer, nor fail to have been declared in the moſt expreſs terms, which, he thinks, cannot be ſaid of any of the texts alleged to prove it. The words tranſlated *eternal* and *for ever*, muſt have been ambiguous to the Jews, *i. e.* to the firſt Chriſtians; and the figurative expreſſion, "their worm dieth not" &c. is far leſs determinate than many phraſes, which our Saviour might have choſen, had it been his intention to denounce abſolutely eternal miſery. This critic adds, that it does not appear from the writings of the moſt ancient fathers, that they put ſuch a conſtruction upon the words of the New Teſtament; and the omiſſion of this doctrine in the ancient creeds ſhews, that it was no original doctrine, or not thought eſſential; which yet could not be, if it was believed; or that many eminent perſons for ſome centuries were of a contrary opinion. And indeed the doc-

trine

trine of purgatory, taught by the Papiſts, ſeems to be a corruption of a genuine doctrine held by the ancient fathers concerning a purifying fire. It may perhaps be ſaid, ſays this author, that the abſolute eternity of puniſhment was not received, till after the introduction of metaphyſical ſubtleties relating to time, eternity, &c. and the ways of expreſſing theſe, *i. e.* not till after the Pagan philoſophy, and vain deceit, had mixed itſelf with, and corrupted Chriſtianity. He adds, it by no means appears to be conſonant to the nature of the Chriſtian religion to interpret the New Teſtament in a ſtrict literal manner, or adhere to phraſes in oppoſition to the general tenor of it; and therefore we are rather to follow the general tenor of it than to adhere to particular expreſſions. Hence it follows, that we ſhould advert to thoſe other paſſages whoſe ſtrict and literal ſenſe is contrary to the doctrine of eternal miſery. In ſuch a caſe it ſeems, that the infinite goodneſs of God, ſo many ways declared in the ſcriptures, muſt ſoon turn the ſcale. For the ſcriptures muſt be made conſiſtent with themſelves, and the veracity and goodneſs of God ſeem much rather to oblige him to perform a promiſe than to execute a threatening.

It has been ſaid, however, that it is dangerous, in a moral view, to announce the denial of the eternity of hell torments. But this, it has been replied, appears to be unfounded. On the other hand it has been ſaid, that the avowal of this doctrine may drive men to deſpair, that it gives religion a gloomy aſpect, deprives it of its pleaſing form, and ſeems more adapted to make the Deity terrible to us than an object of love. Beſides, the majority of mankind are incapable of forming a clear, determinate, and effectual idea of eternal puniſhment. The expreſſion is too abſtract, not ſenſible, not concrete enough to affect the minds of ſuch men, who cannot conceive abſtract expreſſions otherwiſe than by applying them to particular caſes. Tell ſuch a man that he ſhall remain a very long time in priſon, he will be much leſs affected, than if a certain number of years were mentioned. The expreſſion, *eternal puniſhment*, will convey to him no idea; as he will imagine it to repreſent a certain number of years, ſo that the proper idea of eternity, at which he cannot arrive, will be loſt to him, or at leaſt will make no impreſſion on his mind, which a determinate number of years would not have done with equal force and certainty. Let us, however, ſuppoſe that he can form a juſt idea of eternal duration, probably one of the two following conſequences would enſue. His religion, if it did not make him totally abandon it, and fall into practical Atheiſm, would be chiefly ſuperſtition, conſiſting more in fear and terror than love and confidence in God; or he would ſeek to leſſen his burdenſome fear and diſquiet by the hope that the number of the damned, amongſt believing Chriſtians at leaſt, muſt be extremely ſmall; that a man, baptized in the name of Chriſt, could not draw upon himſelf damnation but by an eminently wicked life, or the moſt deteſtable religious errors; and that, if he were not worſe than the majority, or guilty of immediately offending God; and of crying injuſtice againſt his neighbour, but took care to avoid crimes forbidden by the law, he ſhould eſcape eternal puniſhment, and conſequently all puniſhment, as he knows no other. Beſides, as every one believes, that there is a certain proportion between crimes and their puniſhment, both in degree and duration, it would be natural for perſons, chargeable with what they might deem ſmall offences, to conſider eternal puniſhment as too diſproportionate to the ſum of their guilt for them to fear it; or not to hope being ſecured from it by an adherence to the worſhip of the church to which he belongs, a right faith, and an obſervance of the ceremonies of religion.

Amongſt thoſe who deny the eternity of hell-torments, a queſtion has occurred of conſiderable importance; and that is, how theſe torments terminate? Some have maintained, that they end, after a certain degree of ſuffering correſponding to the demerit of the offender, in the total deſtruction or annihilation of the conſcious being. This is what ſome have ſuppoſed to be the "ſecond death" denounced againſt the workers of iniquity in the book of Revelation (ch. ii. 11. xx. 16. 24.); and the "everlaſting deſtruction from the preſence of the Lord," mentioned by the apoſtle Paul. (2 Theſſ. i. 9.) This is what the advocates of this opinion ſuppoſe to be meant by our Lord, when he ſays to his diſciples, "Fear him who is able to deſtroy both ſoul and body in hell." (Matt. x. 28. Luke xii. 5.) Here, they ſay, he plainly propoſes the *deſtruction* of the ſoul (not its endleſs pain and miſery) as the ultimate effect of the divine diſpleaſure, and greateſt object of our fear. Again, when he ſays, (Matt. xxv. 46.) "Theſe ſhall go away into everlaſting puniſhment, but the righteous into life eternal;" it appears evident, it is ſaid, that by that "eternal puniſhment," which is ſet in oppoſition to "eternal life," is not meant any kind of "life," however miſerable, but the ſame which the apoſtle expreſſes by "everlaſting deſtruction, &c." It is further alleged, that the term "death" is the moſt frequently made uſe of to ſignify the end of wicked men in another world, or the final effect of divine juſtice in their puniſhment. (Rom. vi. 23. James, i. 15.) Death, it is ſaid, when applied to the end of wicked men in a future ſtate, properly denotes "their ceaſing to exiſt," or a total "extinction of life and being." It is added, in confirmation of this ſenſe of the word, that the bodily diſſolution which all men undergo in this world is uſually termed by our Saviour and his apoſtles, not "death," but "ſleep;" becauſe, from *this* death, the ſoul ſhall be raiſed to life again; but from the *other*, that which is fully and properly "death," and of which the former is but an image or ſhadow, there is no recovery; it is an "eternal death," or an "everlaſting deſtruction." The figures, it is alſo ſaid, by which the eternal puniſhment of wicked men is deſcribed, agree to eſtabliſh the ſame doctrine. One figure is that of combuſtible materials thrown into a *fire*, and which will conſequently be entirely conſumed, if the fire be not *quenched*. (Matt. xxv. 41.) Accordingly, it is ſaid, that the image of *fire unquenchable or everlaſting* is not intended to ſignify the degree or duration of *torment*, but the abſolute certainty of *deſtruction* beyond all poſſibility of a recovery. Thus, the cities of Sodom and Gomorrha are ſaid to have "ſuffered the vengeance of an eternal fire;" that is, they were ſo effectually conſumed and deſtroyed, that they could never be rebuilt. (Compare Matt. xviii. 8. Mark, ix. 43. 46. Iſaiah, lxvi. 24. ch. xxxiii. 14. Rev. xx. 14.) It is farther obſerved, that death, ſpiritual and eternal, or annihilation, is properly ſtated in the New Teſtament an *everlaſting* puniſhment, as it is irrevocable and unalterable for ever. Others, as Origen among the ancients, and ſeveral modern writers, particularly Dr. Hartley and chevalier Ramſay, have apprehended, that at length all the damned, not excepting the fallen angels and Satan himſelf, will be ſo reformed by the diſcipline of their puniſhment, as to be brought to real penitence and piety; upon which they will not only be releaſed from their priſon, but admitted to partake with the bleſſed in everlaſting happineſs. Thoſe ſcriptures, in which God is ſaid to "deſire" and "will the ſalvation of all," as well as the arguments that are alleged to demonſtrate the abſurdity

of eternal punifhments, compared with the arguments both from reafon and fcripture, in proof of the immortality of the foul, are urged to this purpofe. In proof of the final happinefs of all mankind, it has been urged, that all the evils that befal either body or mind in this ftate, have a tendency to improve one or both. Arguing from analogies taken from this ftate concerning that which is future, we ought to infer, that the evils of a future ftate will have the fame tendency and final caufe with thofe of the prefent life, *viz.* to meliorate and perfect our nature, and to prepare them for ultimate unlimited happinefs. Moreover, the generation of benevolence, by the natural and neceffary tendency of our frames, is a ftrong argument for the ultimate happinefs of all mankind. It is inconfiftent to fuppofe that God fhould thus compel us to learn univerfal unlimited benevolence; and then not provide food for it. This and the preceding argument are both fupported, independently of the divine benevolence, by the analogy and uniformity apparent in the creation, by the mutual adaptations and correfpondencies of things exifting at different times, and in different places; but they receive much additional force from the conlideration of the goodnefs of God, demonftrated by other evidences. Moreover, the infinite goodnefs of God is an argument for the ultimate happinefs of mankind; and the infinite happinefs and perfection of God afford, not only an argument, but, as it were, a pledge of the ultimate happinefs and perfection of all his creatures. The impartiality of God, in refpect of all his creatures, feems to argue, that, if one be made infinitely happy upon the balance, all will be made fo. There are alfo many obvious and undeniable arguments, deduced from the relative attributes of God, which firft exclude the eternal mifery of his creatures, and then eftablifh their ultimate happinefs by neceffary, or, at leaft, by probable conlequences. Then the whole tenor of nature repreients God to us as our creator, preferver, governor, friend, and father. Will a being, fuftaining thefe relations to mankind, perpetuate an exiftence, which ceafes to afford happinefs, and can only produce mifery without end? The governor and judge of the world will do right. But, in whatever manner fin may be eftimated, it muft be finite, becaufe it is the work of a finite mind, of finite principles and paffions: and, therefore, to fuppofe a finner to be abfolutely condemned to infinite irreverfible mifery, on account of the fins of this life, feems highly injurious to the juftice of God. And to fay that this infinite irreverfible mifery is not merely the conlequence of the fins of this life, but alfo of thofe to be committed in another, is to give a power of repenting and becoming virtuous, as well as of finning, in another life; whence the fentence might be reverfed, contrary to the fuppofition. Befides, it feems to be inconfiftent with the character of an infinitely merciful father to doom his children to eternal mifery, without farther trials than thofe which this life affords. Do we not fee numberlefs inftances of perfons at prefent abandoned to vice, who, nevertheleis, according to all probable appearances, might be reformed by a proper mixture of correction, inftruction, hope, and fear? And what man is neither able nor willing to do, may and muft, as it fhould feem, be both poffible to God, and actually effected by him. He muft have future difcipline of a feverer kind for thofe whom the chaftifements of this life did not bring to themfelves: yet ftill they will be all fatherly chaftifements, intended to amend and perfect, not to be final and vindictive. By fuch reafonings, purfued much farther than our limits will allow of our introducing them, has Dr. Hartley attempted to fhew, that it is unfuitable to the benevolence of the Deity, or to the relations which he bears to us, according to the light of nature, to make infinite irreverfible mifery commencing at death, the punifhment of the fins of this life; and by a farther profecution of the fame method of reafoning, he conceives, we fhall be led firft to exclude mifery upon the balance, and then to hope for the ultimate unlimited happinefs of all mankind.

This author next inveftigates the doctrines of fcripture on this fubject; and in this inveftigation he endeavours to fhew, firft, that the texts alleged to prove the abfolutely eternal and irreverfible mifery of the wicked in another life, may be juftly interpreted in a different fenfe; and, fecondly, that other paffages eftablifh the contrary doctrine of the ultimate happinefs of all mankind. He adds, in a more general way, that all the arguments for the ultimate happinefs of all mankind, taken from the relations which we bear to God, as our creator, preferver, governor, father, friend, and God, are abundantly atteited by the fcriptures; and that the fcriptures furnifh fome arguments for the ultimate reftoration and happinefs of all mankind, which now feem fufficiently full and ftrong, and which yet could not be underftood in former ages, or, at leaft, we fee, in fact, they were not. Of this kind is the hiftory of the Jewifh ftate, with the prophecies relating to it. The Jewifh ftate, Dr. Hartley conceives, as a type of each individual in particular, on one hand; and of mankind in general on the other. It is alfo foretold, that Chrift will "fubdue all things to himfelf;" and fubjection to Chrift, according to the figurative prophetic ftyle of the fcriptures, is happinefs, not merely fubjection by compulfion, like that to an earthly conqueror. Similar paffages occur in other parts of the Old and New Teftaments, which the author adduces in fupport of the general argument. Others, however, are of opinion, that the paffages cited by Dr. Hartley in favour of the reftoration of all mankind to happinefs, may be more fatisfactorily interpreted in another way, fo as to afford no ground for this fentiment.

If we combine the two opinions above ftated, the refult may probably furnifh another fcheme with regard to the future punifhment of mankind, lefs liable to objection, more conformable to the fuggeftions of reafon and experience, more conliftent with the rectitude and benevolence of the divine government, and more fuitable to the general language and to particular paffages of fcripture, than either of the other opinions feparately conlidered. Whilft fome of the human race conligned to merited punifhment may be ultimately deftroyed, others may be ultimately happy. Accordingly, vice or fin, in its principles, difpofitions, and habits, is no lefs pernicious and fatal to the foul of man, than malignant diforders are to his corporeal frame. It deranges his mental and moral powers; it vitiates their foundnefs and deadens their activity: and in its progrefs and prevalence tends to the death or deftruction of the intelligent and immortal fpirit. We may partly infer, from the prefent effects of human degeneracy, what may be its probable conlequences and iffue in a future ftate. As no prefent inftruction or correction is fufficient to reclaim the licentious and profligate, and to recover them to penitence and virtue, it is poffible, and, indeed, not very unlikely, that the more fevere difcipline of a ftate of retribution may prove ineffectual to reftrain rooted difpofitions of vice, and to reform obftinate and imperious habits, fo that thofe who indulge them fhall proceed from one ftage of moral depravity to another, till they become altogether irreclaimable. As fome bodily diforders advance from one ftage of inveteracy to another till they are abfolutely irremediable, and muft ultimately terminate in diffolution, fo

ſo vice, conſidered as a growing and deadly diſeaſe of the mental conſtitution, may end in its total derangement and final deſtruction. If ſuch caſes ſhould occur, it ſeems to be inconſiſtent neither with juſtice or benevolence, nor with any known meaſure of the divine adminiſtration, to expunge characters of this kind from the book of life, and to conſign the wicked, thus incapable of reformation, to utter annihilation. Others, whom the milder methods of perſuaſion and diſcipline, reſtricted to the preſent probationary ſtate, were inſufficient to preſerve from vice and to form for virtue and happineſs, may derive moral benefit from the penal effects of preſent miſconduct in a future world; the ſeverer diſcipline of a ſtate of anguiſh and miſery may recover them to a right mind; and the chaſtiſements of juſtice, inflicted in a leſs or greater degree and of ſhorter or longer duration, as their caſes may require, may fit them for being objects of benevolence, and for participating in various proportions, correſponding to their diſpoſitions and capacities, the bleſſedneſs of thoſe whom God approves and favours in the celeſtial manſions. Upon this ſcheme, none are excluded from happineſs, who are capable of enjoying it; nor are any doomed to extinction, who are not incapable of reformation by any of the milder or more awful diſpenſations of that righteous and benevolent providence, which extends its ſovereignty to this world and to that which is to come.

To all ſchemes, which ſuppoſe the termination of the future puniſhment of the wicked by annihilation, or the limitation of its continuance, and the ultimate happineſs of thoſe who are reformed by it, it has been objected by the advocates of its perpetuity and abſolute eternity, that, if they were true, it would not be expedient to promulgate them. Men, it has been ſaid, are very wicked, notwithſtanding the fear of eternal puniſhment; and therefore would probably be more wicked, if this fear were removed, and a hope given to the moſt licentious and profligate of altogether being deſtroyed, or of ultimately attaining everlaſting happineſs. Dr. Hartley, and his annotator Piſtorius, have anticipated, and endeavoured to obviate, this objection. The former obſerves, that this opinion is already publiſhed ſo far, that few irreligious perſons can be ſuppoſed to believe the contrary much longer; or, if they do believe abſolutely eternal puniſhment to be the doctrine of the ſcriptures, they will be much induced thereby to reject revealed religion itſelf. It ſeems, therefore, to be now a proper time to inquire candidly and impartially into the truth. Beſides, it does not ſeem, that even the motives of fear are leſſened to conſiderate perſons, by ſuppoſing the fire of hell to be only a purifying one; for it is clear, from the ſcriptures, that the puniſhment will be very dreadful and durable, inſomuch, that we can ſet no bounds either to the degree or duration of it: they are therefore practically infinite. Moreover, the motives of love are infinitely enhanced by ſuppoſing the ultimate unlimited happineſs of all, whilſt we pity the moſt wicked at preſent, as "veſſels of wrath," and yet live in certain hopes of rejoicing with them at laſt; labour to bring this to paſs, and to haſten it; and conſider, that every thing is good, and pure, and perfect, in the ſight of God. Piſtorius repreſents the caſe ſomewhat differently. Suppoſing, he ſays, it could be proved that the fire of hell is a purifying fire, would it be adviſable to advance this, and directly to maintain it, in univerſal ſocieties? This queſtion he has weighty reaſons for anſwering in the negative. Our ſocieties, or the greater part of them at leaſt, may not be ſufficiently prepared for the reception and right application of this doctrine. The preacher, he thinks, takes the ſafeſt way, who, in his public diſcourſes on this ſubject, goes no farther than revelation itſelf, the words of which he undertakes to explain and enforce. It doth not behove him to diſpel that wiſe and ſalutary darkneſs with which ſcripture has enveloped the future fate of mankind. Hitherto, he adds, the torments of hell have ever been repreſented as eternal. Our auditors are ſo accuſtomed to this notion, that they have aſſociated the idea of eternity with that of hell-torments, in ſuch a manner as to conſider it an eſſential part of them. Many unthinking men, therefore, hearing that it is not impoſſible for them to be converted in eternity, and that probably in ſome period of it their torments would ceaſe, might imagine that the pains of hell themſelves may likewiſe be annihilated, or at leaſt no longer figure them of ſufficient weight to be affected by them; in the ſame manner as a man who is accuſtomed to ſee and to ſuffer ſevere puniſhment, little heeds a milder chaſtiſement, though it would be ſenſible and efficacious enough of itſelf, or in other circumſtances; or, as a man who has borne a very heavy burden, when a lighter is placed on his ſhoulders, is inſenſible of the load. But if it be admitted, on the other hand, that the ſcriptures do not clearly aſſert the impoſſibility of a converſion and alteration in eternity; we muſt go no further on that ſide than they do, and at leaſt avoid making it a point of our public duty to demonſtrate it to be impoſſible. Would it not be moſt adviſable to treat the ſubject with the ſame caution, and to paſs it over for the ſame reaſons, as a prudent and conſcientious preacher would treat cautiouſly, and perhaps wholly paſs over the ſimilar point, of the poſſibility of a death-bed converſion?

HELL, *Hades*, is ſometimes alſo uſed, in the ſcripture ſtyle for *death* and *burial*; becauſe the Hebrew and Greek names ſignify ſometimes the place of the damned, and ſometimes ſimply the grave. See ADES.

The word hell is of Saxon extraction, and ſignifies a *covered place*: and thence, by an eaſy tranſition, the place of the dead, or the inviſible ſtate into which death removes mankind. From the ſame original, we ſtill retain in our language the word *heal*, or *hele*, which ſignifies *to cover over*: and in this ſenſe lord King maintains that the word hell is uſed and ought to be underſtood in the Apoſtles' Creed: the meaning of the article relating to our Saviour's deſcent into hell being no other than this, that his ſoul, being ſeparated from his body by a real tranſition of local motion, went into an unſeen region of ſpirits, where, according to the laws of death, it remained among other pious departed ſouls till the reſurrection of his body. Others contend that he deſcended into the place of torment, where he triumphed over the devils, &c. Crit. Hiſt. of the Apoſtle's Creed, p. 181, &c. Pearſon on the Creed, p 225.

The Romaniſts add, that he there comforted the ſouls in purgatory, and brought away the ſpirits of the patriarchs, and other juſt perſons, departed till that time, carrying them with him into paradiſe.

In the Romiſh church, that part of hell, wherein thoſe were retained who died in the mercy and favour of God before our Saviour's ſufferings, is called limbus. See LIMBUS and PURGATORY.

HELL-*gate*, in *Geography*, a ſtrait of America, near the W. end of Long iſland ſound, oppoſite to Harlem in York iſland, and about 8 miles N.E. of New York city, remarkable for its whirlpools, which make a tremendous roaring at certain times of the tide. Theſe whirlpools are occaſioned by the narrowneſs and crookedneſs of the paſſage, and a bed of rocks which extends quite acroſs it. A ſkilful pilot

may conduct a ſhip of any burden, with ſafety, through this ſtrait, at high water with the tide, and at low water with a fair wind. The Indians have a tradition, that, in ſome remote period, their anceſtors could ſtep from rock to rock, and croſs this arm of the ſea on foot at Hell-gate.

Hell, *Valley of*, a dangerous defile, or paſs, from the Briſgaw, through the Black foreſt into Swabia, E. of Friburg.

Hell *Skerries*, a cluſter of ſmall iſlands of Scotland, near the weſtern coaſt; 10 miles W. of Rum iſland. N. lat. 57°. W. long. 6 53'.

Hell-*weed*, in *Rural Economy*, a common name often employed provincially to ſignify bindweed.

HELLANA, in *Ancient Geography*, a town of Italy, in Etruria, S.E. of Piſtoria.

HELLAS, an appellation which is ſometimes uſed to comprehend the whole of Greece; but more commonly for that part of Theſſaly which was inhabited by the Hellenes, the ſons of Deucalion. According to Ariſtotle, in his Treatiſe of Meteors (l. i. c. 14.) the country, denominated Hellas, was, in ancient times, that which comprehended the environs of Dodona and the river Achelous.

Hellas, a town of Theſſaly, according to Strabo; who ſays, that the inhabitants of Melitæa ſuppoſed it to be at the diſtance of ten ſtadia from their city. Dicearchus ſays, that a town of this name was built by Hellen, father of Eolus, and that it was ſituated in Theſſaly, between Pharſalia and Melitæa. It is probable, that the name of Hellas commenced when the Pelaſgi united together and formed a claſs of people under the denomination of Hellenes. Accordingly the central part of Theſſaly was called Hellas, or the country of the Hellenes.

HELLCAR Sough, or *Hillcar Water-level*, in *Geography*, is one of the moſt conſiderable ſubterraneous paſſages in Derbyſhire, or perhaps in the kingdom, for diſcharging the waters of mines. It begins near to the Derwent river, at a place called Hellcar, almoſt oppoſite to Darley church, and proceeds about a mile in limeſtone-ſhale and ſhale-grit, when it croſſes (under Stanton Moor) a ridge of the firſt limeſtone, for about 200 yards, and then proceeds about $1\frac{1}{8}$ mile further in ſhale, when it again interſects the firſt limeſtone, and proceeds $\frac{1}{4}$ of a mile in it, along Black-ſhale-pits mine, and into Craſh-purſe and Bacon-cloſe mines, near to Yolgrave, in which two laſt mines, water-preſſure engines on a curious conſtruction, are worked by letting a part of the Lathkil river, fall 144 feet into this ſough. (See the Philoſophical Magazine, vol. xxxvii, p. 5, and Mr. Farey's Report on Derbyſhire).

This ſough is elliptical in its form, five feet wide, and ſeven or eight high, and has water ſufficient for long boats carrying 18 or 20 tons, which were uſed in bringing out the ſtuff excavated in the driving of it. The vaſt height of Stanton Moor prevented any air-ſhafts being ſunk, until, after a dreadful exploſion of fire, damp had happened, and killed the workmen. A ſhaft, ſunk on the N.W. corner of the moor, is about 360 feet deep, the ſough being about half that depth where it croſſes under Eccleſter Brook. The expence of driving this ſough is ſaid to have exceeded 50,000*l.* excluſive of a long branch from it into B. Thornhill's mines, in Stanton in the Peak.

HELLEBERG, a town of Sweden, in the province of Smaland; 23 miles N.W. of Calmar.

HELLEBORE, in *Botany*. See Helleborus.

Hellebore, *Baſtard*. See Serapias.

Hellebore, *with a globoſe flower*, or *globe ranunculus*. See Trollius.

Hellebore, *Black*. See Helleborus.

Hellebore, *Fennel-leaved black*. See Helleborus.

Hellebore, *White*. See Veratrum.

Hellebore, ΕΛΛΕΒΟΡΟΣ, or *Elleborus*, in the *Materia Medica*, a medicinal plant, reputed among the ancients a ſpecific for the cure of melancholy and madneſs.

There are two kinds of hellebore, the *black* and the *white*. For their reſpective botanical characters, ſee Helleborus and Veratrum.

The black hellebore, called alſo "Melampodium," and, becauſe in mild weather it flowers in January, Chriſtmas flower, is a native of Auſtria and Italy, and was unknown in this country till it was cultivated by Mr. John Gerard in 1596. The root, which is the part uſed in medicine, is perennial, rough, knotted, and externally of a black colour, internally whitiſh, and ſends off many ſtrong round long fibres. When freſh its taſte is bitteriſh, and ſomewhat acrid, and according to Grew, (Anatomy of Plants,) benumbs the tongue, when chewed and retained for ſome time upon it, and affects it with a kind of paralytic ſtupor, like the ſenſation produced by eating or ſupping any thing too hot. It has alſo a naſeous acrid ſmell; but on being long kept, its ſenſible qualities and medicinal activity are much diminiſhed. Bergius diſtinguiſhes its virtues according to its different ſtates of dryneſs, thus: "virtus; *rec.* venenata, rubefaciens, veſicans; *recenter ſiccatæ*; emetica, purgans, emmenagoga, antiphthiriaca, ſternutatoria; *diu conſervatæ*; vix purgans, alterans, diuretica." Many proofs occur of the poiſonous effects of this root, and therefore it ſhould be uſed with caution. Among the ancients it was thought, principally from its purgative quality, to poſſeſs great efficacy in maniacal diſorders, and particularly with a view to the evacuation of the *atra bilis*, from which they ſuppoſed theſe mental diſeaſes to proceed. Accordingly they ſpeak of it in terms of high commendation, and in their familiar phraſes refer to its wonderful efficacy; *e. g.* "*caput* helleboro *dignum*;" Horace ſays, "Miſers need a double doſe of hellebore.

> "Danda eſt hellebori multo pars maxima avaris;
> Neſcio an Anticyram ratio illis deſtinet omnem."
> Hor. Sermon. l. ii. ſat. 3. v. 82.

The iſland of Anticyra, ſituated over-againſt mount Oeta, was famous for the growth of this plant as well as of the white hellebore; here it was found in its greateſt perfection, and uſed with the beſt effect; whence aroſe the proverb, "Naviget Anticyram," ſend him a voyage to Anticyra, ſpoken of a madman. It has been doubted, however, whether our hellebore be the ſame ſpecies with that which is ſaid to have grown in the iſland of Anticyra, and about mount Olympus. From the accounts of Tournefort and Bellonius, who botanized theſe places, a ſpecies of this plant was found in great plenty, which the former ſuppoſes to be the hellebore of Hippocrates. It differs indeed from the ſpecies figured by Woodville, by having a large branched ſtem, and alſo by its effects, for he found, that a ſcruple of the extract brought on violent ſpaſms and convulſions; but many plants are known to vary as much by a removal from their native ſoil and climate. As evacuations, which are often found neceſſary in various caſes of alienations of mind, may be procured with greater certainty and ſafety by other medicines, this catholicon of antiquity is almoſt univerſally abandoned in modern practice. It is now regarded chiefly as an alterative, and thus employed in ſmall doſes for attenuating viſcid humours, promoting the uterine and urinary diſcharges, and opening inveterate obſtructions of the remoter glands. In plethoric habits it often proves a very powerful emmenagogue, where ſteel is ineffectual or improper. It is alſo recommended in dropſies, and ſome cutaneous diſeaſes,

diſeaſes, by Aviceinna, Geſner, Klein, Milman, and Bacher, whoſe famous tonic pills are thus prepared; ℞ Ext. Helleb. nig. Myrrhæ ſolutæ aa 3j Pulv. Card. bened. 3iij M. F. S. A. c. Maſſa aere ſicco exſiccanda, donec formandis pilulis apta ſit, ſingul. ad grau. Semiſs.

The watery extract of this root, made as directed in the pharmacopœias, is one of the beſt and ſafeſt preparations of it, when deſigned for a cathartic, as it contains both the purgative and diuretic parts of the hellebore; it may be given in a doſe from 10 grains to a ſcruple or more. The irritating power of its active matter is conſiderably abated by the boiling. (Lewis Mat. Med.) A tincture of this drug, prepared by macerating for 14 days, black hellebore root ſliced, 4 oz. in two pints of proof ſpirit, and ſtraining, is preferred for the purpoſes of an alterative and deobſtruent; of which a tea-ſpoonful twice a day may be conſidered as a common doſe.

The white hellebore, or "veratrum," is a native of Italy, Switzerland, Auſtria, and Ruſſia; it was cultivated in this country by Gerard, previouſly to the year 1596. The root is perennial, about an inch thick, externally brown, internally white, and beſet with many ſtrong fibres. It is not certain that our white hellebore is the Ελλεβορος λευκος of the Greek writers. Their identity is inferred more from the ſimilarity of their effects upon the body than from an agreement in their botanical characters. Hippocrates frequently mentions hellebore ſimply, or generically, by which it is ſaid, the white is to be underſtood, as he adds the words "black or purging" when the other ſpecies is meant; and as the purgative powers of veratrum are known to be weaker than thoſe of the black hellebore, the diſtinction is ſo far applicable to the effects now experienced of the roots of our hellebores.

Every part of the plant, as well as the root of white hellebore, is very acrid and poiſonous; ſo that its leaves and even ſeeds prove deleterious to different animals. The dried root has no peculiar ſmell, but a durable nauſeous acrid bitteriſh taſte, burning the mouth and fauces; when powdered and applied to iſſues or ulcers it produces griping and purging; if ſnuffed up the noſe it is a violent ſternutatory. Geſner made an infuſion of half an ounce of this root with two ounces of water; of this he took two drams, which produced great heat about the ſcapulæ, and in the face and head, as well as the tongue and throat, followed with ſingultus, which continued till vomiting was excited. The root, taken in large doſes, diſcovers ſuch acrimony, and operates upwards and downwards, with ſuch violence, that blood is uſually diſcharged; it likewiſe acts very powerfully upon the nervous ſyſtem, producing great anxiety, tremor, vertigo, ſyncope, loſs of voice, interrupted reſpiration, ſinking of the pulſe, convulſions, ſpaſms, cold ſweats, &c. Upon opening thoſe who have died by the effects of this poiſon, the ſtomach diſcovered marks of inflammation, with corroſions of its interior coat, and the lungs have been found inflamed, and their veſſels much diſtended with dark blood. The ancients, notwithſtanding the virulence of this drug, employed it internally in ſeveral diſeaſes, eſpecially thoſe of a chronic and obſtinate kind, as mania, melancholia, hydrops, elephantiaſis, epilepſia, vitiligo, lepra, rabies canina, &c.; conſidering it ſafer when it excited vomiting, which was the firſt effect Hippocrates wiſhed to perceive. To perſons of feeble conſtitutions, and to thoſe who laboured under pulmonary complaints, it was conſidered as unſafe. Mayerne gave from two to three grains of an extract of this root with conſiderable advantage in maniacal caſes, where no remarkable evacuation took place; and Con. Geſner, who made many experiments upon this drug, adminiſtered it, not as an evacuant but as an alterative. Greding, however, made the moſt ample trial of it, and he found that ſeveral maniacal and melancholic caſes were relieved by it, ſome were completely cured, and others derived no benefit. It was the bark of the root, collected in ſpring, which he gave in powder, beginning with one grain, and increaſing the doſe according to its effects. He ſometimes uſed the extract prepared after Stoerck's manner. In almoſt all caſes, the medicine acted more or leſs upon all the excretions; vomiting and purging were generally produced, and the matter expectorated was conſtantly mixed with bile; a florid redneſs often appeared in the face, with cutaneous efflorescences on the body; and in ſome, pleuritic ſymptoms with fever ſupervened ſo as to require bleeding, and the more alarming affections of ſpaſms and convulſions were not unfrequent. Critical evacuations were often evident, many ſweated profuſely, in ſome the urine was conſiderably increaſed, and in others, the ſaliva and mucous diſcharges. Alſo uterine obſtructions, of long continuance, were often removed by this drug. White hellebore has alſo been found uſeful in epilepſy, and other convulſive complaints; but the diſeaſes in which its efficacy ſeems leaſt equivocal, are thoſe of the ſkin, as ſcabies and different prurient eruptions, herpes, morbus pediculoſus, lepra, ſcrophula, &c.; and in many of theſe it has been ſucceſsfully employed both internally and externally. As a powerful ſtimulant, and irritating medicine, its uſe has been recurred to only in deſperate caſes, and it has been adminiſtered in ſmall doſes, and in a diluted ſtate; the quantity being increaſed according to its effects.

The decoction of the pharmacopœia is prepared by boiling an ounce of white hellebore root powdered, in two pints of water down to a pint, ſtraining the decoction, and after it has cooled, adding two fluid-ounces of rectified ſpirit. An ointment is prepared by mixing two ounces of powdered root with eight ounces of prepared lard, and 20 minims of oil of lemons. N.B. The minim is the 61,440th part of the ſtandard wine gallon of the exchequer; or the 60th part of a fluid-drachm.

The fœtid hellebore, bear's foot, or helleboraſter, found wild in many parts of England, and flowering about February, has a ſmall root, beſet with a prodigious number of ſlender dark-coloured fibres. This plant has been lately introduced by the London college into the pharmacopœia, probably, it is ſaid, upon the authority of Dr. Biſſet, who recommends the leaves as poſſeſſing extraordinary anthelmintic powers. The ſmell of the plant, when recent, is very fœtid, the taſte is bitter, and remarkably acrid, ſo as to excoriate the mouth and fauces; it operates commonly as a cathartic, ſometimes as an emetic, and in large doſes it proves highly deleterious. The leaves, the only part noticed by the college, have been long domeſtically employed in this country for their vermifuge effects. Gerard mentions them in this reſpect; and Dr. Biſſet ſays "the great baſtard black hellebore, or bear's foot, is by far the moſt powerful vermifuge for long round worms, of any I have yet experienced." "The decoction of about a dram of the green leaves, or about 15 grains of the dried leaves in powder, is the uſual doſe adminiſtered to children betwixt four and ſeven years of age; a full or ſufficient doſe generally proves more or leſs emetic, and often looſes the belly a little. It is uſually repeated on two, and ſometimes three ſucceſſive mornings; the ſecond doſe has commonly a greater effect than the firſt, and never fails to expel round worms by ſtool, if there be any lodged in the alimentary tube."

"The juice of the green leaves," ſays he, "made into a ſyrup with coarſe ſugar, is almoſt the only vermifuge I have uſed againſt round worms for three years paſt. Before preſſing

preſſing out the juice, I moiſten the bruiſed leaves, which are a little ſucculent, with ſome vinegar, which is a corrector of this medicine, and prevents it from inducing great ſickneſs or much vomiting. Of this ſyrup I give one tea-ſpoonful at bed-time, and one or two in the morning, on two or three ſucceſſive days, to children betwixt two and ſix years of age, increaſing or diminiſhing the doſe a little, according to the ſtrength of the patient." (Eſſay on the Medical Conſtitution of Great Britain) When this does not open the body, an equal quantity of tincture of rhubarb is directed to be added. Dr. B. ſpeaks of this plant as uſeful alſo in ſome aſthmatic and hypochondriacal diſorders. We have tried, ſays Dr. Woodville, the authelminthic effects of this plant, upon a girl of twenty years of age, with conſiderable advantage. Woodv. Med. Bot.

HELLEBORE, in *Gardening*, the common name of a well-known plant. See HELLEBORUS.

HELLEBORINE, in *Botany*, ſo called on account of the reſemblance of its leaves to the *Helleborus albus* of the older botaniſts, *Veratrum album* of Linnæus. Bauh. Pin. 186. Tourn. Inſt. 436. t. 249. See EPIPACTIS.

HELLEBORUS, ελλεβορος μελας of Dioſcorides, or black hellebore. The name is, with moſt appearance of probability, derived from ελειν, *to kill*, and βορα, *food*, or *fodder*, in alluſion to the poiſonous qualities, for which it has been famous throughout all antiquity. Linn. Gen. 282. Schreb. 379. Willd. Sp. Pl. v. 2. 1335. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 272. Sm. Fl. Brit. 598. Prodr. Fl. Græc. v. 1. 386. Juſſ. 233. Tourn. t. 144. Lamarck. Illuſtr. t. 449. Gærtn. t. 65.—Claſs and order, *Polyandria Polygynia*. Nat. Ord. *Multiſiliquæ*, Linn. *Ranunculaceæ*, Juſſ.

Gen. Ch. *Cal.* none, (unleſs the corolla, which in ſome ſpecies is permanent, be taken for ſuch, with Juſſieu). *Cor.* Petals five or more, roundiſh, obtuſe, large. Nectaries ſeveral, very ſhort, placed circularly, of one leaf, tubular, contracted in their lower part; the orifice of two erect emarginate lips, of which the innermoſt is the ſhorteſt. (Theſe are the petals, according to Juſſieu). *Stam.* Filaments numerous, awl-ſhaped; anthers terminal, erect, compreſſed, narroweſt in their lower part. *Piſt.* Germens ſuperior, from three to ſix, compreſſed; ſtyles awl-ſhaped; ſtigmas thickiſh. *Peric.* Capſules compreſſed, with two keels; the lower, or outer one ſhorteſt; the upper, or inner one longeſt, at length burſting. *Seeds* ſeveral, round, affixed to the edges.

Eſſ. Ch. Calyx none. Petals five, or more. Nectaries tubular, two-lipped. Capſules compreſſed, nearly erect, with many ſeeds.

The following five are the only genuine ſpecies of this genus, as far as hitherto diſcovered.

1. H. *niger*. Linn. Sp. Pl. 783. Curt. Mag. t. 8. Woodv. Med. Bot. t. 18. Jacq. Auſtr. t. 201. (H. niger, flore roſeo; Bauh. Pin. 186. H. niger verus; Ger. Em. 976).—Leaves pedate. Flower-ſtalks radical, one or two-flowered. Bracteas ovate.—Native of rocky mountains in Auſtria, Italy, and Greece. In our gardens it is hardy, flowering in December or January if the weather be open, whence it has obtained the name of the Chriſtmas roſe. Few plants are more elegant. The large concave *flowers*, white, with a tinge of bluſh-colour, are finely contraſted with the ample dark and ſhining foliage. The *roots* are perennial, creeping, entangled, very black externally, with numerous, long, ſimple, perpendicular fibres. This ſpecies was univerſally taken for the true black hellebore of the ancients, till Tournefort found what he ſuſpected to be the true one. See *H. Officinalis*.

2. H. *viridis*. Linn. Sp. Pl. 784. Jacq. Auſtr. t. 106. Curt. Lond. faſc. 6. t. 34. Engl. Bot. t. 200. (Helleboraſtrum; Ger. Em. 976.)—Leaves fingered. Petals ſpreading. Flower-ſtalks radical, many-flowered. Bracteas deeply lobed, ſerrated. Native of ſtony, rather mountainous places in Auſtria, Stiria, Switzerland, &c. found occaſionally on a chalky ſoil in England. On conſidering this plant, we are convinced that a real item is erroneouſly attributed to it in *Fl. Brit.* and *Engliſh Botany*. The *leaves* are indeed all radical, much narrower than thoſe of the firſt ſpecies, digitate, ſcarcely pedate. The *flower-ſtalks* alſo radical, taller than the leaves, branched, bearing about three green expanded *flowers*, and ſeveral alternate, large, deeply lobed, ſometimes pedate, ſerrated, leafy *bracteas*. The *roots* are black, with numerous long fibres, but are rather tuberous than creeping. We learn from the *Flora Londinenſis*, that they are uſed in London for the true black hellebore; and probably their qualities are the ſame, for this ſpecies is even more nearly allied to the ancient Greek plant than the foregoing.

3. H. *officinalis*. Salif. Tr. of Linn. Soc. v. 8. 305. Sm. Prodr. Fl. Græc. v. 1. 386. (H. orientalis; Lamarck. Dict. v. 3. 96. Willd. Sp. Pl. n. 5. H. niger orientalis, ampliſſimo folio, caule prælto, flore purpuraſcente; Tourn. Cor. 20.)—Leaves pedate. Flower-ſtalks radical, many-flowered. Bracteas deeply lobed, ſerrated.—Gathered on Mount Athos, Delphi, and the Bithynian Olympus, as well as on hills near Theſſalonica, and plentifully near Conſtantinople, by Dr. I. Sibthorp, who juſtly decided it to be the ελλεβορος μελας of Dioſcorides, conſequently the true plant which ought to be uſed in medicine. The modern Greeks name it σκαρφη; the Turks *Zopleme*. The *roots* are moſt like thoſe of the laſt, but the *leaves* are truly pedate, and their lobes elliptical, twice the breadth of that ſpecies. The *flower-ſtalks* do not riſe above the leaves, but are branched, bearing five or ſix drooping concave *flowers*, white, turning purpliſh as they fade, as if intermediate between the firſt and ſecond ſpecies. The numerous, fingered, ſerrated, leafy *bracteas* accord more with the latter. A moſt inimitable drawing of this plant, by Mr. Ferdinand Bauer, is deſtined for the *Flora Græca*, t. 523. The medical qualities of the root are acrid and violently purgative, and were ſuppoſed uſeful in maniacal caſes. As the true oriental plant may not be acceſſible to us, it is uſeful to know that the preceding is the ſafeſt ſubſtitute for it, though leſs active; while the following, which has ſometimes been uſed by fraud or miſtake, is more violent and dangerous.

4. H. *fœtidus*. Linn. Sp. 784. Bulliard. t. 71. Engl. Bot. t. 613. Woodv. Med. Bot. t. 19. (Helleboraſter maximus; Ger. Em. 1338.)—Stem leafy, many-flowered. Leaves pedate; lobes lanceolate. Bracteas ſimple, entire. Petals cloſed.—Native of Germany, Switzerland, France, and England. With us it prefers a chalky ſoil, among buſhes, in rather hilly places, flowering in February or March. It is the firſt harbinger of ſpring in ruſtic gardens. The *ſtem* is near two feet high, branched, round, many-flowered, enveloped in large rounded tufts of dark recurved evergreen *leaves*. The *bracteas* are pale, ovate, ſome of them three-lobed, with entire edges. *Flowers* cup-ſhaped, ſmaller than any of the former, green, acquiring a dark purpliſh edge in decay. Dr. Woodville ſtrongly recommends this plant to kill worms in children. The doſe is about 15 grains of the dried leaves in powder, for two or three ſucceſſive mornings, for a child between four or ſeven years of age, which proves gently emetic and purgative.

5. H. *lividus*. Ait. Hort. Kew. v. 2. 272. Curt. Mag. t. 72.

t. 72. (H. fœtidus β; Linn. Sp. Pl. 784. H. niger trifoliatus; Ald. Hort. Farn. 93. t. 92.)—Stem leafy, many-flowered. Leaves ternate. Bracteas ſimple, ſerrated.—Firſt deſcribed by Aldinus amongſt his deſcriptions of rare plants cultivated in the Farneſe garden at Rome, in 1625. He received it from Henry Corvinus, a botaniſt and apothecary at Delft, and Lamarck, who in his Dictionary deſcribes it by the name of *triphyllus*, v. 3. 97, ſays he has ſeen it in the gardens at Vienna and Straſburg, yet its native country is unknown. With us it is rather rare, and not quite hardy. It flowers in winter time, or in the early ſpring. Linnæus, having never ſeen this plant, confounded it with the laſt, from which it is abundantly diſtinguiſhed by its glaucous livid hue, larger and more expanded *flowers*, but eſpecially by its ternate and more ovate *leaves*. The *ſtem* and *footſtalks* are purpliſh.

Three more ſpecies are found in Willdenow comprehended under this genus.

1. H. *hyemalis*. Linn. Sp. Pl. 783. Jacq. Auſtr. t. 202. Bulliard. t. 35. Curt. Mag. t. 3. Native of the mountains of Germany, Switzerland, France, and Italy; common in our gardens in ſpring, where it comes forth with the Snow-drop and Crocus. This is a little herbaceous plant, with a yellow flower, whoſe petals are, as Linnæus obſerves, deciduous. For this reaſon, Mr. Saliſbury has made it a diſtinct genus, in Tr. of Linn. Soc. v. 8. 303. by the name of *Eranthis*, from ερω, *to love*, and ανθος, *a flower*, and its habit, ſo widely different from *Helleborus*, ſtrongly juſtifies the meaſure.

2. H. *ranunculinus*. Sm. Pl. Ic. t. 37. (H. niger orientalis, ranunculi folio, flore nequaquam globoſo; Tourn. Cor. 20. Trollius humilis, flore patulo; Buxb. Cent. 1. t. 22. T. patulus; Saliſ. Tr. of L. Soc. v. 8. 303.)—Native of Cappadocia. When firſt deſcribed from Tournefort's herbarium, it was referred to *Helleborus*, becauſe of its affinity to the *hyemalis*, but it has perhaps more the habit of *Trollius*. The nectaries, however, do not agree with this latter, being tubular.

3. H. *trifolius*. Linn. Sp. Pl. 784. Am. Acad. v. 2. 356. t. 4. f. 18. Fl. Dan. t. 566. Michaux Boreal. Am. v. 1. 325.—Native of Siberia, Iceland, Labradore, Canada;—found from Hudſon's Bay to Pennſylvania, in Cypreſs woods, growing amongſt bog-moſs, according to Michaux. This has alſo a deciduous corolla, and its habit is totally wide of *Helleborus*. Mr. Saliſbury calls it *Coptis*, from κοπτω, *to cut*, and ranges with it, as another ſpecies, a very pretty plant with twice ternate *leaves* and green *flowers*, found by Mr. Menzies on the north-weſt coaſt of America, from whom we have ſpecimens and a coloured drawing. We ſhould rather perhaps refer both ſpecies to *Iſopyrum*, for want of a ſufficiently decided character in the fructification.

HELLEBORUS, in *Gardening*, comprehends plants of the herbaceous perennial kind; of which the ſpecies moſt generally cultivated are, the winter hellebore, or yellow winter aconite (H. hyemalis); the black hellebore, or Chriſtmas roſe (H. niger); the green hellebore (H. viridis); the ſtinking hellebore, or bear's foot (H. fœtidus), and the livid purple, or great three-flowered black hellebore (H. lividus.)

Method of Culture.—The firſt ſpecies may be increaſed by planting off-ſets from the roots as ſoon as the leaves are decayed, towards the end of the ſummer ſeaſon, in the ſituations in which they are to grow and flower, in ſpots of ſeveral together. They have a very good effect when intermixed with the ſnow-drop, from their being of a ſimilar habit of growth, and their flowers appearing nearly about the ſame period. Off-ſets are capable of being ſeparated from the old plants every third or fourth year.

The ſecond ſpecies may be multiplied by dividing the roots in the autumnal ſeaſon, and planting them out in ſuch places as are moiſt, warm, and ſheltered in the different clumps, borders, and other parts where the ſoil is freſh, and not impregnated with manure. But that it may flower in perfection it ſhould have the protection of glaſſes during the winter. And in this view a few of the plants may be placed in pots, which will afford great convenience for the purpoſe.

In the third and fourth ſpecies the increaſe may be readily effected by ſowing the ſeeds, either in the ſituations where the plants are to grow, or in beds formed for the purpoſe, in the autumn or ſpring months, thinning the young plants out afterwards to a few, or tranſplanting them into other beds, to be placed in rows at the diſtance of a foot from each other.

They often come up well from ſelf-ſown ſeed, and ſucceed perfectly in ſhady places.

And the laſt ſpecies is capable of being increaſed either by ſowing the ſeeds or dividing the roots. The well ripened ſeeds ſhould be put into the ground, or the parted roots planted out, during the autumn, either in pots of light freſh mould, or in warm protected parts of the clumps and borders. The plants ſhould, in their after treatment, be protected in the green-houſe, or in the ground by the uſe of hand glaſſes, during the winter ſeaſon. But they are far from increaſing faſt in either of theſe modes.

All theſe plants are of the ornamental claſs, the firſt ſort adorning the fore parts of the beds, clumps, and borders, while the third and fourth ſpecies contribute their effects to the larger compartments, and the wilderneſs quarters, and the ſecond and laſt diſplay themſelves among the potted collections.

HELLEH, HELLAH, or *Hillah*, in *Geography*, a town of the Arabian Irak, ſituated on both ſides of the Euphrates with a bridge of communication, ſuppoſed to have been built on the ſcite of the ancient Babylon. The gardens are covered with fruit-trees, particularly palms, ſo that the town appears as ſituated in a wood; 60 miles S. of Bagdad. N. lat. 32° 20'. W. long. 43° 45'.

HELLEFORS, a town of Sweden, in Nericia; 40 miles N.N.W. of Orebro.

HELLELANDS, a town of Norway, in the dioceſe of Chriſtianſand; 26 miles S. of Stavanger.

HELLENES, in *Ancient Hiſtory*. See GRÆCIA.

HELLENIA, in *Botany*, ſo named by Willdenow in honour of Charles Nicholas Hellenius, profeſſor of philoſophy at Abo in Finland, under whoſe preſidency numerous botanical diſſertations, in Latin or Swediſh, have been publiſhed. Willd. Sp. Pl. v. 1. 4. Brown. Prodr. Nov. Holl. 307. (Heritiera; Retz. Obſ. faſc. 6. 17. Alpiniæ ſpecies; Roſcoe Tr. of Linn. Soc. v. 8. 346.)—Claſs and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Linn. *Cannæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of one leaf, tubular. *Cor.* of one petal; tube the length of the calyx; outer limb in three deep ſegments, the upper one largeſt and pointed; inner of one lip, longer, with a little tooth at the baſe on each ſide. *Stam.* Filament one, linear, ſhorter than the inner lip, extended a little beyond the anther, in a ſmall rounded, very ſhort lobe, either entire or cloven; anther attached by its back, of two elliptical lobes, with a channel between them. *Piſt.* Germen inferior, roundiſh, with three furrows; ſtyle thread-ſhaped, a little longer than the ſtamen; ſtigma obtuſe. *Peric.* Capſule roundiſh, three-lobed, cruſtaceous, brittle, three-celled. *Seeds* ſeveral in each cell, nearly kidney-ſhaped, each inveſted with a ſoft arillus.

Eſſ.

Eſſ. Ch. Anther two-lobed, embracing the ſtyle, with a very ſhort, rounded, terminal appendage. Inner limb of the corolla a ſimple lip, with a tooth on each ſide at the baſe. Capſule cruſtaceous, brittle ſeeds with an arillus.

This genus, eſtabliſhed by Retzius and Willdenow on no ſolid principles, the only clue to the diſtinction of Scitamineæ genera, ſince publiſhed by Mr. Roſcoe, and founded on the form of the filament, being then unknown, was by the ingenious writer laſt named referred to *Alpinia*. He had not ſeen it alive, and therefore had not detected the ſmall appendage to the filament, beyond the anther; which Mr. Brown has pointed out, as well as other marks, indicated above, all together ſufficient to ſtamp it as a good genus. The original ſpecies is,

1. *H. Allughas*. Retz. Obſ. faſc. 6. 17. t. 1. (Alughas; Linn. Zeyl. 207.)—Lip cloven. Leaves entire, ſmooth. Capſule downy. Style ſmooth.—Native of Ceylon. About two feet high, with elliptic-oblong, ſmooth, entire *leaves*, a foot long or more; their ſtalks ſheathing. *Panicle* terminal, branched, many-flowered, downy, with ſmall downy *bracteas* at its ſub-diviſions. *Calyx* downy, cloven. *Corolla* red, about an inch long, its lip divided half way down, obtuſe, and ſomewhat crenate. *Fruit* downy and brittle.

To this Mr. Brown has added the following.

2. H. *cærulea*. Br. Prodr. 308.—"Lip emarginate. Leaves entire, ſmooth. Capſule ſmooth. Style hairy."—Native of New Holland within the tropics, and even of the country near Port Jackſon.

Retzius and Willdenow enumerate three other ſpecies, *alba*, *chinenſis*, and *aquatica*, which, not having ſeen, we cannot certainly tell how correctly they are referred hither.

HELLENISM, a ſort of Greciſm: or a phraſe peculiarly accommodated to the genius and conſtruction of the Greek tongue.

Helleniſm is diſtinguiſhed from Greciſm, in that the former is not applied to authors who have written in Greek; their language, it is evident, ſhould be a continual helleniſm; but it is applied to authors who, writing in ſome other language, uſe terms and expreſſions peculiar to the Greek.

There are abundance of helleniſms in the vulgate verſion of the ſcriptures.

HELLENISM is alſo uſed in the ſame ſenſe with Heatheniſm or Gentiliſm. And Heathens are called Hellenes, and Helleniſts, by our eccleſiaſtical hiſtorians, Socrates, Sozomen, and Theodoret eſpecially, in their hiſtory of Julian's reign. We may alſo obſerve, that Gentile Greeks are invariably called in ſcripture Ἕλληνες, *Hellenes*, in contradiſtinction to Ἑλληνισταί, or *Helleniſts*; which ſee.

HELLENISTIC, or HELLENISTIC *language*, that uſed among the Helleniſts.

The critics are divided as to this language. Several of them, and among the reſt Druſius and Scaliger, take it to be the language uſed among the Grecian Jews. They add, that it is in this language the Greek tranſlation of the Septuagint was written, and even the books of the New Teſtament compoſed. M. Simon calls it the *language of the ſynagogue*.

It muſt not be imagined that this was any peculiar language diſtinct from all others, or even any peculiar dialect of the Greek; in the ſame ſenſe as the Attic, the Ionic, and the Doric, are called different dialects, for there are in it no peculiarities in the inflexions of either nouns or verbs. It was thus denominated to ſhew that it was Greek, mixed with Hebraiſms and Syriaciſms; or that the phraſeology is Hebrew, whilſt the words are Greek. This ſingular manner in the ancient tranſlators is to be conſidered as partly intentional and partly accidental;—partly intentional, becauſe, from the ſcrupulous, and even ſuperſtitious, attachment of the Jews, not only to the words, but to the letters and ſyllables, to every jot and tittle of the original, they would be led to attempt a manner of tranſlating ſo ſervilely literal as is always incompatible with purity in the language into which the tranſlation is made;—partly accidental, becauſe, even without deſign, a perſon ſpeaking or writing a foreign language, frequently mingles in his ſpeech the idioms of his native tongue. One ſource of the peculiarities in idioms may have ariſen from this circumſtance, that the tranſlators of the Septuagint, though Jews, were Alexandrians: and moreover the habit which the apoſtles and evangeliſts had of reading the ſcriptures and hearing them read, whether in the original or in the ancient verſion, would, by infecting their ſtyle, cooperate with the tendency which, as natives of Paleſtine, they would derive from converſation, to intermix Hebraiſms and Chaldaiſms in their writings. Hence we may infer that the writings of the New Teſtament carry, in the very expreſſion and idiom, an intrinſic and irreſiſtible evidence of their authenticity. They are ſuch as, in reſpect of ſtyle, could not have been written but by Jews, and hardly even by Jews ſuperior in rank and education to thoſe whoſe names they bear.

Salmaſius rejects the common opinion of the learned touching the Helleniſtic language, and has written two volumes on the ſubject, in which there is not a little logomachia.

HELLENISTS, HELLENISTÆ, a term occurring in the Greek text of the New Teſtament, and which in the Engliſh verſion is rendered *Grecians*.

This term Grecians occurs only thrice in our Engliſh verſion of the New Teſtament, *viz.* Acts, vi. 1. ch. ix. 29. and xi. 20. But it is well known to the learned, that in the ſecond of theſe paſſages the Alexandrian manuſcript has Greeks; which is alſo the reading in the third text, not only in the Alexandrian manuſcript, but likewiſe in the Latin vulgate, and ſeveral other verſions, whence it is concluded by Dr. Lardner, that the ſame perſons are not intended in the third and laſt texts, as in the two former. The critics have been much divided as to the ſignification of the term. Some learned writers have enumerated no leſs than ſeven different opinions. (See Fabr. Bib. Græc. l. iv. c. 6. t. iii. p. 226. Wolfii Curæ ad act. vi. 1.) The moſt prevailing opinions, however, are theſe two. Some by this appellation underſtand Jews born out of Judea, who ſpake Greek, and uſed the Greek verſion of the Old Teſtament in their ſynagogues. Oecumenius, in his ſcholia in Acts, vi. 1. obſerves, that it is not to be underſtood as ſignifying thoſe of the religion of the Greeks, but thoſe who ſpoke Greek, τους ἑλληνιστι ἐφθεγξαμενους. The authors of the vulgate verſion, indeed, render it like ours "Græci;" but Meſſrs. Du Port Royal, "Juifs Grecs," *i. e.* Greek or Grecian Jews: ſuppoſing that the term refers to the Jews who ſpoke in Greek, and who are thus diſtinguiſhed from the Jews called "Hebrews," *i. e.* thoſe who ſpoke the Hebrew tongue of that time. Theſe Grecian Jews, or Helleniſts, it is ſaid, were thoſe who lived in Egypt and other parts, where the Greek tongue prevailed; and to whom we owe the Greek verſion of the Old Teſtament, called the *Septuagint*; which ſee. See alſo the preceding article.

Salmaſius and Voſſius are of a different ſentiment with regard to the Helleniſts. The latter will only have them to be thoſe who adhered to the Grecian intereſts.

Scaliger is repreſented, in the Scaligerana, as aſſerting the Helleniſts to be the Jews who lived in Greece and other places, and who read the Greek bible in their ſynagogue, and uſed the Greek language, *in ſacris*: and thus they were oppoſed to the Hebrew Jews, who performed their public worſhip

in the Hebrew tongue; and in this ſenſe (he ſays) St. Paul ſpeaks of himſelf as a Hebrew of the Hebrews, Phil. iii. 5. *i. e.* a Hebrew both by nation and language. The Helleniſts are thus properly diſtinguiſhed from the Hellenes or Greeks, mentioned John, xii. 20. who were Greeks by birth and nation, and yet proſelytes to the Jewiſh religion.

Dr. Campbell, in his "Preliminary Diſſertations," is of opinion, that there was in the time of the apoſtles a diſtinction made between thoſe Jews who uſed the Greek language, and the Hebrews, or thoſe who ſpoke the language of Paleſtine, and of the territory of Babylon, which they affected to call Hebrew. Accordingly he ſuppoſes that thoſe called Grecians in Acts, vi. 1. were Jews: and this he infers from the hiſtory. Thus he ſays that this event happened before Peter was ſpecially called to preach the goſpel to Cornelius and his family, who were the firſt fruits of the Gentiles to Chriſt. Beſides, ſays this writer, though the word "Grecian," made uſe of in our tranſlation is ſynonymous with "Greek," yet the term employed in the original is never applied in the New Teſtament to Pagan Greeks, but ſolely to thoſe Jews who had reſided always or moſtly in Grecian cities, and conſequently whoſe common tongue was Greek. The Gentile Greeks are invariably called in ſcripture Ἕλληνες (ſee HELLENES), whereas the term uſed in the place quoted is Ἑλληνισταί, a word which even in claſſical authors does not mean Greeks, but "imitators of the Greeks," or "thoſe who write or ſpeak Greek;" being a derivation from the word ἑλληνιζειν, to ſpeak Greek, or imitate the Greeks.

The ſecond opinion with regard to the Grecians, or Helleniſts, is that advanced by Beza, and adopted by Baſnage, Pearſon, Lardner, and others, which ſuppoſes that they were proſelytes, or men of other nations, who had embraced the Jewiſh religion, or, in other words, proſelytes to Judaiſm. Accordingly, in Acts, vi. 1. they are contraſted with the Hebrews, by whom are meant native Jews, deſcendants of Abraham and Iſrael. Hebrews was a very honourable, and the moſt ancient denomination of the Jewiſh people. It ſeems to have been peculiar to Abraham and his deſcendants by Iſaac and Jacob, when Moſes was ſent to conduct the people of Iſrael out of the land of Egypt. (Exod. iii. 6. 15. 16. 18. iv. 5.) It was a common denomination of the children of Iſrael during their abode in Egypt; and in the firſt book of Samuel, it is often uſed as equivalent to Iſraelites, or the people of Iſrael; but it is ſeldom found in the later books of the Old Teſtament. In the laws, recorded in the books of Moſes, (ſee Exod. xxi. 2. Deut. xv. 12. Lev. xxv. 44—46.); three ſorts of perſons are clearly diſtinguiſhed, *viz. Hebrews*, or children of Iſrael, that is, native Jews; then *ſtrangers ſojourning among them*, or proſelytes; and laſtly, *Heathens*, that is, the nations, or Gentiles. Indeed, the denomination Hebrew was peculiar to the deſcendants of the ancient patriarchs; nor were the people of Iſrael called Jews, till about the time of the Babyloniſh captivity. In the New Teſtament there are three places where this title is found, viz. 2 Cor. xi. 22. Philip. iii. 5. and Acts, vi. 1. As Paul was a Hebrew, though born out of Judea, at Tarſus in Cilicia, where the Greek tongue was uſed, we are fully aſſured, that by the Grecians cannot be meant Jews, who uſed the Greek language. From all the texts, alleged from the Old and New Teſtament, it appears, ſays Dr. Lardner, that the denomination or character of Hebrew, is the privilege of birth, not of choice, or acquiſition, or accidental circumſtance. All deſcendents of Abraham by Iſaac and Jacob, wherever they are born, and whatever language they uſe, are Hebrews; nor can any other men be Hebrews, but thoſe only who are deſcended from Abraham. This is the firſt conſideration, tending to determine, who theſe Grecians were. That they were proſelytes may be further argued from the neglect with which they were treated. Their widows were diſregarded, no allowances or diſtributions were made to them. For this neglect two reaſons are alleged: they were few in number, and they were deſpiſed. Native Jews, deſcendants of Abraham and the patriarchs, would of courſe have been preferred to proſelytes; but there is no reaſon why any Jews ſhould have been neglected, merely becauſe they were born out of Judea, and uſed the Greek language. But proſelytes might be overlooked, becauſe they were reckoned much inferior to Iſraelites. Theſe were far from enjoying equal civil privileges with the children of Iſrael. (See Jerem. ch. xxxiv. and the laws above referred to in the books of Moſes.) Who theſe proſelytes mentioned Acts, vi. 1. and ix. 29. were, it is not eaſy to aſcertain. There might be many ſuch perſons in Judea, and in other countries all over the world where the Jewiſh people reſided; ſome of them might have been deſcendants of thoſe who had joined themſelves to the people of Iſrael in former times; and others might have been new converts to the Jewiſh religion; ſome of thoſe, who at the time when the event above mentioned occurred, lived in Judea, were poor, and were poſſibly the ſervants of the Roman governor, or of their officers, who coming to Judea with their maſters, might have been converted to the Jewiſh religion. There were others who had ſerved Jews out of Judea, and who, unwilling to ſerve heathens, might ſeek ſubſiſtence in Judea. It is farther urged in ſupport of the opinion, that theſe Grecians were proſelytes, that upon their complaints, a proſelyte was choſen to be one of the ſeven, to preſide in the daily miniſtration, even Nicholas of Antioch. Dr. Lardner thinks, there is great propriety in St. Luke's ſtyle, calling the Jews, who were of the ſeed of Iſrael, Hebrews, and proſelytes, Helleniſts, Grecians, or perhaps Hellenes, Greeks, from their origin; the latter being, perhaps, the true reading, as the former appellation is uſed only by St. Luke in this book, and is thought not to occur in any other writer ſo ancient, and, therefore, might have been the invention of ſome Chriſtians. A Hebrew, denoting a Jew by ancient deſcent, muſt be fitly oppoſed to Grecians, thereby underſtanding proſelytes, who were Jews by religion only, and not by birth. Lardner's Works, vol. xi. Campbell's Prelim. Diſſ. p. 5—10.

HELLENODICÆ, Ἑλλανοδικαι, in *Antiquity*, the directors or preſidents of the Olympian games. At firſt this office was exerciſed by Iphitus alone, and it continued for 200 years to be executed by a ſingle perſon; but in the 50th Olympiad the number increaſed to two, who were choſen by lot out of the whole body of the Elæans, and in the 75th Olympiad it was increaſed to nine; three of whom had the direction of the equeſtrian exerciſes, three preſided at the Pentathlon, and the remaining three had the inſpection of the other games. Two Olympiads after a tenth was added; and in the 103d Olympiad, the college of Hellenodics conſiſted of twelve, anſwering to the tribes of the Elæans, out of each of which was choſen one Hellenodic. The number of Elæan tribes, and of courſe that of the Hellenodics, was afterwards reduced to eight; but in the 108th Olympiad, they returned to the former number of ten, and ſo continued. They aſſembled in a place called Ἑλλανοδικαιον, in the Elæan forum, where they were obliged to reſide ten months before the celebration of the games, to take care that ſuch as offered themſelves to contend, performed their προγυμνασματα, or preparatory exerciſes, and to be inſtructed in all the laws of games by certain men called

called νομοφυλακες, *i. e.* keepers of the laws. And the better to prevent all unjuſt practices, they were farther obliged to take an oath that they would act impartially, would take no bribes, nor diſcover the reaſon for which they diſliked or approved of any of the contenders. At the ſolemnity they ſat naked, having before them the victorial crown till the exerciſes were finiſhed, and then it was preſented to whomſoever they adjudged it. Nevertheleſs, there lay an appeal from the Hellenodicæ to the Olympian ſenate. The direction and arrangement of all matters belonging to the Olympic feſtival, the proclaiming of the ceſſation of arms, the excluding from the ſacrifices thoſe who had incurred the penalty of excommunication by refuſing to ſubmit to their cenſures, the increaſing or diminiſhing of the number of the exerciſes, &c. belonged to the Hellenodics as well as the ſuperintendence of the games, and the beſtowment of the olive-crown. This power of excommunicating thoſe who were refractory or contumacious, which ſeems to have been exerciſed upon whole nations, rather than particular perſons, gave the Hellenodics great dignity and authority among the ſeveral people of Greece; as the corporal puniſhment and pecuniary penalties inflicted by their orders upon private offenders, held even the greateſt in dread of infringing the Olympic laws, and kept in order that vaſt aſſembly, which was compoſed of men of all ranks and degrees, and of every region and colony of Greece. In the public execution of their office, the Hellenodics were clothed in purple robes, and carried in their hands that uſual enſign of magiſtracy, a wand or ſceptre; and it ſeems probable alſo, that all the Grecians who aſſiſted at the Olympic games were adorned with crowns or garlands. The Hellenodics took their ſtations at different parts of the ſtadium, and the ſenior had the precedency of the reſt. In the exerciſe of the power of excommunication, they were ſupported by the joint concurrence of the gods, as well as the men of Greece. Weſt's Diſſertation on the Olympic Games, § 5. Pott. Archæol. Græc. lib. ii. cap. 22. tom. i. p. 448.

HELLENODICÆUM, Ελλανοδικαιον, the place where the hellenodicæ were uſed to aſſemble.

HELLENOTAMIÆ, Ελληνοταμιαι, Athenian officers appointed to receive the money due from the tributary cities.

They were alſo called *hellenotamiæi*.

HELLESPONT, in *Ancient Geography*, the name of the ſtrait which formed a communication between the Ægean ſea in the Archipelago and the Propontis, or the ſea of Marmara. Thoſe geographers who have moſt accurately ſurveyed the form and extent of this ſtrait, aſſign about ſixty miles to its winding courſe, and about three miles to its ordinary breadth. The narroweſt part of the channel is found to the northward of the old Turkiſh caſtles, between the cities of Ceſtus or Seſtus, and Abydus. It was in this part that Leander braved the paſſage of the flood for the poſſeſſion of his miſtreſs. Here it was likewiſe, in a place, where the diſtance between the oppoſite banks cannot exceed 500 paces, that Xerxes impoſed a ſtupendous bridge of boats, for the purpoſe of tranſporting into Europe 170 myriads of barbarians. (See CONSTANTINOPLE.) This ſtrait is ſuppoſed to have derived its name from the "Hellenes," and to have been called the "Sea of the Hellenes," becauſe on the banks of this ſtrait they began to form their Greek eſtabliſhments. The poets, however, diſſatisfied with this ſimple etymology, have ſought its name in the event that gave occaſion to the ARGONAUTIC expedition, which ſee.

HELLESPONT was alſo the name of a province of Aſia Minor, being that which had been called Myſia, and which was one of the ten provinces of the dioceſe of Aſia, in the Notitia Imperii.

HELLIN, in *Geography*, a town of Spain, in the province of Murcia; 17 miles S. of Chinchilla.

HELLO, a town of Pruſſia, at the eaſtern extremity of the Hohe Nerang; 12 miles N. of Dantzic.

HELLOT, JOHN, in *Biography*, was born in 1686, and deſtined by his friends for the profeſſion of theology, but, accidentally meeting with a book of chemiſtry, he made that ſcience the principal purſuit of his life. From the year 1718 to 1732, he was employed as the compiler of the "Gazette de France." He tranſlated Schlutter's work on the "Fuſions of Ores, and on Founderies," and inſerted his own notes and remarks. He publiſhed a work, entitled "L'Art de la Teinture des Laines et Etoffes de Laines," which is reckoned a very valuable treatiſe, and is the firſt in which chemical principles are applied to the practice of the art. He furniſhed many articles to the "Memoirs of the Academy of Sciences," and ſome to the Royal Society of London, of which he was a member. He died at Paris in 1766.

HELLOTIA, Ελλωτια, in *Antiquity*, two feſtivals, one of which was celebrated in Crete, in honour of Europa, called hellotia; the other was celebrated by the Corinthians, with ſolemn games and races, wherein young men contended, running with lighted torches in their hands. See a farther account of theſe feſtivals in Pott. Archæol. Græc. lib. ii. cap. 20. tom. i. p. 393.

HELLOTIS, Ελλωτις, a myrtle garland, carried in proceſſion with Europa's bones at the feſtival called Hellotia.

This garland was no leſs than twenty cubits in circumference.

HELLS, in the *Iron Manufacture*, are ſmall blaſt furnaces uſed for the re-melting of iron for caſting at the founderies.

HELM, in *Sea Language*, is a long and flat piece of timber, or an aſſemblage of ſeveral pieces, ſuſpended along the hind-part of a ſhip's ſtern-poſt, where it turns upon hinges to the right or left, ſerving to direct the courſe of the veſſel. The helm is uſually compoſed of three parts, *viz.* the rudder, the tiller, and the wheel, except in ſmall veſſels, where the wheel is unneceſſary.

HELM, *a-lee the*. See A-LEE.

HELM, *bear up the*. See BEARING.

HELM, *eaſe the*. See EASE.

HELM, *port the*. See PORT.

HELM, *right the*, or *helm the midſhip*. See RIGHT.

HELM, *ſhifting the*. See SHIFTING.

HELM, *ſtarboard the*. See STARBOARD.

HELM, in *Chemiſtry*, is the head of a ſtill or alembic; thus called, becauſe in figure it ſometimes reſembles a helm or helmet.

Hence, to bring the thing *over* the helm is the ſame as to force it by fire up to the top of the veſſel, that it may diſtil down into the receiver by the beak of the head.

And when they ſay, ſuch a thing cannot be brought over the helm, they mean that it is of too fixed a nature to be raiſed into vapour by the force of fire.

HELM, in *Rural Economy*, a term occaſionally employed to denote a hovel. It is likewiſe ſometimes made uſe of to ſignify ſtraw prepared for the purpoſe of thatch. See THATCH.

HELMSTADT, in *Geography*, a town of Germany, in the principality of Wolfenbuttle, containing two fauxbourgs, three churches, and an univerſity founded by duke Julius, in 1576, an anatomical theatre, and a public library, and having

having near it a medicinal ſpring; 17 miles E. of Wolfenbuttle. N. lat. 52° 15'. E. long. 11° 8'.

HELMET, or HELM, an ancient armour of defence, worn by the cavaliers, both in war and in tournaments, as a cover and defence of the head; and ſtill uſed by way of a creſt or ornament over the ſhield or coat of arms, or at the top of the eſcutcheon.

The helmet is known by divers other names, as the *head-piece*, *ſteel cap*, &c. The Germans call it *helen* or *hellem*; the Italians *elmo*, the French *caſque*, as did alſo the ancient Engliſh.

The helmet covered the head and face, only leaving an aperture about the eyes, ſecured by bars, which ſerved as a viſor.

Helmets have varied in different ages and countries, in reſpect both of their form and the materials of which they are made, and as the heralds of ancient times have uſed them both as charges within, and ornaments without the ſhield, they are variouſly repreſented in ancient heraldic drawings. The matter of which helmets, as repreſented in heraldry, are ſuppoſed to be made, according to the doctrine laid down by the Germans, is gold, ſilver, and ſteel; which, as they ſay, ſhew three degrees of dignity, *viz.* thoſe of ſovereign princes are of gold, thoſe of the nobility are of ſilver, and thoſe of gentlemen are of poliſhed ſteel.

In France, whence all our heraldry originally came, the following rules obtained:

A perſon newly ennobled, or made a gentleman, bears over his eſcutcheon a helmet of bright iron or ſteel, in profile, or ſtanding ſideways; the viſor quite cloſe.

A gentleman of three deſcents bears it a little open, but ſtill in profile, ſhewing three bars of the viſor.

Ancient knights, &c. have it in profile, but ſhewing five bars; the edges of ſilver.

A baron's helmet is of ſilver; the edges gold, with ſeven bars neither quite in profile, nor yet in front, with a coronet over it adorned with pearls.

Viſcounts and earls formerly bore a ſilver helmet, with gold edges, its poſition like the former; but now they bear it quite fronting, with a coronet over it.

Marquiſes bear a ſilver helmet, damaſked, fronting, with eleven bars, and their coronet.

Dukes and princes have their helmet, damaſked, fronting, the viſor almoſt open, and without bars, with their coronets over them.

Laſtly, the helmets of kings and princes are all of gold, damaſked full fronting, and the viſor quite open, and without bars.

The helmets of baſtards are to be turned to the left, to denote their baſtardy.

Our ancient Engliſh heralds allotted many degrees to theſe ornamental helmets; but at preſent we retain only the following five: *viz.* 1. The full-faced helmet, with ſix bars, all of gold damaſked, for the ſovereign, and princes of the blood. 2. The full-faced helmet, with five bars; the helmet ſteel, and the bars and breaſt-part gold, for dukes and marquiſes. 3. A profile or ſide-ſtanding helmet of ſteel, the bars, bailes, orgriels, and ornaments gold, for earls, viſcounts, and barons. 4. A full-faced helmet of ſteel, with its beaver or viſor open, for baronets and knights. 5. A profile or ſide-ſtanding ſteel helmet, with the viſor ſhut, for an eſquire. (See *Plate of Heraldry*.) Thoſe turned ſideways are ſuppoſed to be giving ear to the command of their ſuperiors; and thoſe right forwards to be giving orders with abſolute authority.

When helmets appear as bearings in arms, which is frequently the caſe, they are always to be repreſented in painting like thoſe adopted for eſquires, unleſs in their original blazon, they are expreſſed to be otherwiſe circumſtanced. If two helmets are placed on one ſhield, they are uſually ſet face to face, in imitation of the method practiſed by the Germans, who ſometimes place ten or more helmets on a ſhield; and in ſuch caſe, they ſet the centre helmet *affrontée*, and thoſe on each ſide looking towards that in the centre.

HELMET-*fiſh*, in *Natural Hiſtory*, the ſcolopendrites or echinus ſpatagus, or foſſil echinus of Dr. Grew, "Rarities," p. 259.

HELMET *flower*, in *Botany*. See ACONITUM.

HELMET *pigeon*, the name given to a particular ſpecies of pigeon, called by Moore the *columba galeata*. It has its name from its having its head covered with a plumage of a diſtinct colour from that of the reſt of the body, and appearing ſomewhat like a helmet covering the head. It is a moderate-ſized pigeon, a little bigger than the ſpecies called the nun. The head, tail, and flight-feathers of the wings, are always of the ſame colour, which is either black, red, or yellow, and ſometimes, though rarely, blue; the reſt of the body is all white. They are red-eyed, and have no hood like that of the nun, otherwiſe they approach much to that ſpecies. Moore's Columbarium, p. 48.

HELMET-*ſtone*, in *Natural Hiſtory*, is a name which Dr. Grew has applied to ſeveral ſpecies of echinites, or foſſil echinus, of which he diſtinguiſhes four kinds, the ſoft-oval, the hard-oval, the blunt-conic, and the ſharp-conic, and figures and deſcribes ſeveral varieties of each, p 259. and 60 of his "Rarities of Greſham College." See GALEA.

HELMINTHAGOGA, of ἑλμινς, *worm*, and αγω, *I expel*, medicines contrived to deſtroy and expel worms.

HELMINTHOLITHUS, of ἑλμινς, *worm*, and λιθος, *ſtone*, in *Natural Hiſtory*, a name given by Linnæus to petrified bodies reſembling worms. Of theſe he enumerates 24 different genera.

HELMINTHOLITHUS, is the ſixth of the eighth genera into which the late Mr. William Martin divided the reliquia or foſſil organic remains (Outlines, p. 186.), and includes therein the ſeparated parts of worms, which are not fabricated by ſuch worms. Of this genera four ſpecies were diſcovered by the author in the ſtrata of Derbyſhire, called entrochites, and are figured in his "Petrificata Derbienſia," *viz.* E. lævis, or even-jointed entrochite, tab. 2, 3, and 24; E. prominens, or convex-jointed entrochite; E. verrucoſus, or warted entrochite; and the E. annulatus, or ring-jointed entrochite. See ENTROCHUS.

HELMINTHOTHECA, in *Botany*, a name given by Vaillant to a genus of plants, ſince deſcribed by Linnæus under the name of *picris*.

HELMINTIA, is derived from ἑλμις, *a worm*, or *maggot*, becauſe its rugoſe ſeed ſomewhat reſembles the figure and attitude of ſuch animals.—Willd. Sp. Pl. v. 3. 1607. Juſſ. 170. Gærtn. t. 153.—Claſs and order, *Syngeneſia Polygamia Æqualis*. Nat. Ord. *Compoſitæ Semifloſculoſæ*. Linn. *Cichoraceæ*, Juſſ.—This genus, which is comprehended in the *Picris* of Linnæus, was originally ſeparated by Vaillant, who called it *Helmintotheca*, but we have given the name adopted by Juſſieu and Gærtner, though we are of opinion that it is too nearly allied to *Picris* to be decidedly ſeparated from that genus. The moſt important mark of diſtinction between *Picris* and *Helmintia* conſiſts in the former having the crown of its ſeed ſeſſile, whereas in the latter it ſtands upon a ſtalk. The only ſpecies of this ſuppoſed genus, according to Willdenow and Juſſieu, is *Picris echioides*. Linn. Sp. Pl. 1114. Sm. Fl. Brit. 814. Engl. Bot. t. 972. Curt. Lond. faſc. 3. t. 51.

HELMONT, JOHN BAPTIST VAN, in *Biography*, a diſ-

tinguiſhed leader in the chemical ſchool of medicine, was born of a noble family at Bruſſels in the year 1577. He exhibited very early proofs of ſuperior abilities, and had finiſhed the uſual courſes of philoſophy at the ſchools of Louvain, in his ſeventeenth year. Before this time he ſeems to have diſcovered, that much of what was called ſcience and philoſophy in books, was a frivolous parade of hypotheſis, and contained very little of certainty or truth: and ſuch was his ardour for real knowledge, that before his twentieth year was completed, he is ſaid to have peruſed the works of Galen twice, thoſe of Hippocrates once, as well as thoſe of almoſt all the Greek and Arabian writers, and to have made a great collection of obſervations from them. He ſeemed to have gained an indiſtinct notion of the neceſſity of experiment and induction, in order to gain actual information; but never ſufficiently methodized his ideas on the ſubject, to be able to purſue that plan with its full advantage. Diſguſted with books, he quitted his native country, after taking the degree of M. D. at Louvain, and commenced a courſe of rambling, which continued during ten years; in which he attended with equal zeal, the profeſſors of magic and philoſophy; and he alſo learned ſome practical chemiſtry from an illiterate man, whom he met by accident. In 1609 he married a noble lady, of large fortune, with whom he retired to Vilforde, where, being likely to meet with few interruptions, he might proſecute his inveſtigation of the three kingdoms of nature with unceaſing diligence. The empirical knowledge, which he had gained, of the uſe of certain chemical remedies, re-called his attention to medicine; and although he deſiſted from viſiting the ſick, or receiving money for his aſſiſtance, great numbers frequented his houſe, and he boaſts in his writings of having cured ſeveral thouſands of people annually. For a period of thirty years he purſued his reſearches into the products of nature, with a perſeverance and induſtry that almoſt exceed belief, and left few of the known animal, vegetable, and mineral bodies unexamined. In the courſe of theſe inveſtigations in his laboratory at Vilforde, he neceſſarily fell upon the diſcovery of ſeveral of the products of decompoſition, and of new combination, which chemiſtry affords: among theſe he ſeems to have been the firſt to notice the ſpirit of hartſhorn, the ſpirit of ſulphur *per campanam*, as it was called, and the aërial part of the ſpa-waters, which he firſt denominated *gas*, (from the German *geiſt*, ghoſt, or ſpirit,) and ſeveral other ſubſtances. Among theſe were many articles poſſeſſing conſiderable influence upon the living body, which, being contraſted with the inertneſs of the ſimples of the Galenical practice, rouſed and confirmed his former opinions againſt the doctrines of that ſchool; which he now attacked with great ardour and ſtrength of argument, and which he greatly contributed to overthrow. He ſhewed the abſurdity of the Galenical hypotheſis of the four elements, the four qualities, the four degrees of theſe, and the four humours, all equally gratuitous; and pointed out the conſequent falſe and erroneous practice deduced from ſuch an hypotheſes. (See GALEN.) But partly in imitation of Paracelſus, whom he greatly admired, and partly from an attempt to generalize the confuſed maſs of new facts, which he had acquired, he attempted to reduce the whole ſyſtem of medicine to the principles of chemiſtry, and ſubſtituted a jargon as unintelligible, and hypotheſes as gratuitous as thoſe which he had attempted to refute. He publiſhed from time to time a variety of works, by which he obtained conſiderable reputation. The elector of Cologne, who was himſelf attached to chemical inquiries, held him in great eſteem; and he received from the emperor Rodolph II., and his two ſucceſſors, invitations to the court of Vienna; but he preferred his laboratory and cabinet to theſe proffered honours. He died on the 30th of December, 1644, in the ſixty-eighth year of his age.

His firſt work was entitled "De Magnetica Vulnerum Naturali et Legitima Curatione, contra Johannem Roberti Soc. Jeſu Theologum," Paris, 1621, 8vo. His next publication was relative to the waters of the Spa, "De Spadanis Fontibus," Liege, 1624, 8vo. Next followed, after a long interval, "Febrium Doctrina inaudita," Antwerp, 1642, 12mo.; and "Opuſcula Medica inaudita, 1. De Lithiaſi; 2. De Febribus; 3. De Humoribus Galeni; 4. De Peſte," Cologne, 1644, 8vo. On his death he requeſted his ſon to collect his papers, as well the incomplete as the finiſhed ones, and to publiſh them in the way which he thought the beſt. They were ſent to the printer, without correction, and without any regard to connection or arrangement, and publiſhed at Amſterdam in 1648, in 4to., under the title of "Ortus Medicinæ, id eſt, initia Phyſicæ inaudita, progreſſus Medicinæ Novus in Morborum ultionem ad Vitam longam." Under the title of "Opera omnia," theſe works have been reprinted at various times and places, and in various languages: the moſt correct edition is that of Amſterdam, in 1652, by Elzevir. They are now conſulted only as curioſities; but, with much error and jargon, they contain many ſhrewd remarks, and curious ſpeculations, and many facts which were at that time new. He anticipated, in obſcure glimpſes, as it were, ſeveral of the important diſcoveries, as well as the hypotheſes of later times: his *Archæus* has been ſoftened down into the *vis medicatrix naturæ* of Hoffmann and Cullen; his doctrine of ferments was adopted by Silvius and his followers; and he greatly cleared the way to chemical diſcoveries. Eloy. Dict. Hiſt. Hutchinſon, Med. Biog. Gen. Biog.

HELMONT, JAQUES VAN, was an hiſtorical painter of conſiderable repute among the Flemings. He was ſon and diſciple of Matthew Van Helmont, a painter of merry-makings, fairs, &c. who practiſed his art with much ſucceſs, though of no great weight of talent. Loſing his father at an early period of his ſtudies, he was indebted chiefly to his own exertions and perſeverance for the ſucceſs he enjoyed.

His aim appears to have been the grand ſtyle of compoſition and deſign; aided by the true natural feeling for colouring, which his countrymen have almoſt all exhibited. Many of the churches, convents, and public buildings in the Low Countries were adorned with his works, ſome of which have been tranſplanted to the gallery of the Louvre. He died in 1726, aged 43.

HELMONT, in *Geography*, a town of Brabant, on the Aa, with an old caſtle; 13 miles S.E. of Bois le Duc.

HELMONTII LUDUS. See LUDUS *Helmontii*.

HELMSLEY, or HELMSLEY-BLACKWOOD, in *Geography*, a market-town and pariſh in the wapentake of Rydall and North Riding of the county of York, England. It is ſeated in the valley called Rye-dale, through which the river Rye meanders. In the year 1801, the town contained 249 houſes, and 1449 inhabitants, many of whom are employed in the manufactory of cottons and linens. Here was formerly a caſtle, ſome remains of which are ſtill ſtanding. In the time of the civil wars, general Fairfax attacked the caſtle, and battered it. The walls of the keep are ten feet in thickneſs, and other parts of proportionate ſolidity. This caſtle is ſaid to have been built by Robert de Roſs, called lord Roſs, of Hamlake. The ſeite and remains belong to Robert Duncombe, eſq. who has a handſome ſeat, called Duncombe Park, at the diſtance of about a quarter of a mile from Helmſley. The houſe was built by ſir John Vanburgh, in the Doric ſtyle of architecture, and is an intereſting ſpecimen of

of that artiſt's ſkill. The ſaloon diſplays peculiar magnificence; and the whole edifice, with its valuable collection of works of art, are entitled to admiration and praiſe. For an account of which the reader is referred to "the works of the late Edward Dayes," 8vo. 1805. In a deep and well-wooded dale, about three miles from Helmſley, are the remains of Rye-Vale abbey, commonly called Rivaulx-abbey. The ruins are ſcattered over a conſiderable extent of ground, and ſtill diſplay many intereſting fragments of architecture; but the chief attraction and beauty of this place is its ſcenery. On each ſide of the vale the hills riſe to a conſiderable height, and are finely adorned with hanging woods. In the work already referred to is an intereſting deſcription of the ruins and the contiguous ſcenery.

HELMSTADT, a town of Germany, in the county of Wertheim; 9 miles S.E. of Wertheim.

HELMSTATT, a town of Germany, in the palatinate of the Rhine; 14 miles S.E. of Heidelberg.

HELNAS, a ſmall iſland of Denmark, in the Little Belt. N. lat. 55° 9'. E. long. 10° 2'.

HELODES, formed of ελος, *marſh*, in *Natural Hiſtory*, a term applied to certain plants, to ſignify their place of growth to be in fens, bogs, or marſhy places; thus a kind of St. Peter's wort, which is diſtinguiſhed from the others by being hairy, and growing always in boggy places, is called by Ray and others, *aſcyrum villoſum helodes*.

HELODES, in *Medicine*. See ELODES.

HELOISE, in *Biography*, was born about the year 1101 or 1102, and is thought to have been the natural daughter of a prieſt, but was brought up by Fulbert, a canon of Paris, who was deſirous of giving her an education ſuitable to the uncommon talents which ſhe exhibited while very young. Abelard, as we have ſeen, (ſee the article ABELARD,) was appointed her tutor, who abuſed the confidence repoſed in him; and then, as the beſt means of repairing the injury, offered to marry her. This ſhe refuſed, although an illegitimate child had been the conſequence of their intimacy: her affection for her lover ſubdued the regard which ſhe had for her own honour. His urgent entreaties on this head were of no avail; ſhe repreſented to him the degradation which, as a philoſopher, he would incur by the low cares of domeſtic life, and the inconſiſtency of wedlock wih the clerical duties, a circumſtance noticed by Bayle to ſhew, that, at this period of the church, the clergy were not prohibited from entering the marriage ſtate. Heloiſe declared ſhe would eſteem it a greater glory to be regarded the miſtreſs of her lover than the wife of an emperor. The conſequences of this refuſal have been already related. It is ſufficient to obſerve, that before ſhe was twenty years of age ſhe devoted herſelf to the auſterities of a convent, the duties of which ſhe performed with ſo much aſſiduity, that ſhe at length became prioreſs. At the diſſolution of the convent by Suger, Heloiſe and her companions retired to an oratory founded by Abelard, then an abbot in the foreſt of Champagne. She ſurvived her former lover about twenty years, and, as ſhe advanced in age, is ſaid to have acquired the auſterity of manners which is natural to one who had relinquiſhed the world, as the conſtitutions which ſhe drew up for the rule of her convent are in the extreme of rigour. She died in May 1163, and by her direction was laid by the ſide of Abelard. Bayle.

HELONIAS, in *Botany*, of which name no explanation is given, nor does any thing ſatisfactory occur to us. Linn. Gen. 180. Schreb. 241. Willd. Sp. Pl. v. 2. 273. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 1. 491. Juſſ. 47. Lamarck Illuſtr. t. 268. Claſs and order, *Hexandria Trigynia*. Nat. Ord. *Coronariæ*, Linn. *Junci*, Juſſ.

Gen. Ch. *Cal.* none. *Cor.* inferior, of ſix oblong equal petals, permanent. *Stam.* Filaments ſix, awl-ſhaped, a little longer than the petals; anthers incumbent. *Piſt.* Germen ſuperior, roundiſh, with three angles; ſtyles three, ſhort, reflexed; ſtigmas obtuſe. *Peric.* Capſule roundiſh, membranous, of three cells. *Seeds* ſeveral, roundiſh.

Eſſ. Ch. Corolla of ſix equal petals. Calyx none. Capſule of three cells, with many ſeeds.

Obſ. Juſſieu ſuggeſts that the fruit may, perhaps, more properly be conſidered as three capſules united; this is rendered probable by its affinity to *Veratrum*.

1. H. *bullata*. Linn. Sp. Pl. 485. Curt. Mag. t. 747. Andr. Repoſ. t. 352. Redout. Liliac. t. 13. H. latifolia; Michaux. Boreal. Amer. v. 1. 212. Veratrum ſcapo fiſtuloſo ſquamoſo, ſpicâ ſtrictâ; Trew. Ehret. 41. t. 77. V. racemo ſimpliciſſimo, corollis patentibus, ſtaminibus longioribus; Mill. Ic. 181. t. 272.)—Leaves elliptic-lanceolate, ſomewhat ſpatulate, ribbed. Stalk radical, ſcaly. Cluſter denſe, ovate. Native of bogs in Pennſylvania and Maryland, common in the European gardens, where it bloſſoms in March or April. The *root* is perennial, with long ſimple fibres. *Leaves* radical, numerous, ſpreading, ſmooth, concave, of an obovate or ſpatulate form, with recurved points, and tapering at the baſe. *Flower-ſtalk* about a foot high, ſolitary, ſimple, round, ſmooth, brownish, bearing ſeveral ſcattered cloſe-preſſed ſcales. *Flowers* many, in a denſe, nearly ovate cluſter, dulliſh crimſon, with blue anthers, inodorous. The plant, at a diſtance, has the aſpect of an Orchis. The ſpecific name *bullata*, taken from a ſynonym of Plukenet's erroneouſly applied, ought, we think, to have been changed. Michaux's, which Mr. Gawler, now Ker, in the Botanical Magazine, cites by miſtake *lanceolata*, is infinitely preferable.

2. H. *aſphodeloides*. Linn. Sp. Pl. 485. Curt. Mag. t. 748. (Xerophyllum fetifolium; Michaux. Boreal. Amer. v. 1 211.)—Leaves linear-awl-ſhaped, rough-edged. Stalk leafy.—Native of Pennſylvania, where the venerable John Bartram firſt found it, and of Virginia. *Root* fibrous, perennial. *Leaves* very numerous, both at the root and on the ſtem, long, narrow, and acute, their edges rough, with minute ſharp ſaw-like teeth. *Cluſter* of innumerable white *flowers*, with yellow *anthers*. This ſpecies is ſaid to bloſſom but rarely in England.

3. H. *pumila*. Jacq. Ic. Rar. t. 453. H. lutea; Curt. Mag. t. 1062. Veratrum luteum; Linn. Sp. Pl. 1479.) Radical leaves obovate; thoſe on the ſtem lanceolate. Cluſter cylindrical. Petals linear.—Native of Virginia, Canada, Pennſylvania, and Carolina. *Root* tuberous, with long fibres. Radical *leaves* numerous, obovate, ribbed, ſmooth, three or four inches long, tapering down into the foot-ſtalk; thoſe on the ſtem much ſmaller, ſcattered, lanceolate. *Cluſter* ſolitary, very long, of innumerable *flowers*, with narrow white petals and yellow anthers. *Germen* certainly ſuperior, though Jacquin, from a poor ill-grown ſpecimen, took it to be inferior, and hence juſtly excited in Willdenow a doubt concerning the genus. Its form is elliptical, three-lobed at the top; colour green. *Styles* ſpreading, recurved, with downy ſtigmas. No one has ſuſpected this plant of Jacquin to be Linnæus's *Veratrum luteum*, which we have proved from his herbarium, nor could its genus have been ſettled without ſpecimens in fruit, ſuch as we have received from the Rev. Dr. Muhlenberg. We cannot refer it to any thing in Michaux.—Its habit cloſely accords with the firſt ſpecies. The *corolla* is permanent.

Michaux defines three other ſpecies, *erythroſperma*, *anguſtifolia* and *dubia*, all with long narrow leaves, of which we can determine nothing.—Willdenow removes hither the

Anthericum

Anthericum calyculatum of Linnæus, *Tofieldia paluſtris*, Sm. Fl. Brit. 397. Eng. Bot. t. 536; but its having a real calyx, and the ſhort ſtyles with blunt terminal ſtigmas, which in the American ſpecies, confounded with our's, are almoſt capitate, rather diſcountenance its union with *Helonias*, however ſimilar they may be in habit and fruit.

HELOPODIUM, from ἕλος, *a wart*, or *tubercle*, and πες, *a foot*, becauſe the tubercles, or fructification, are elevated on ſtalks; a tribe of Lichens, diſtinguiſhed in the *Prodromus* of Acharius, p. 198, but ſubſequently ſunk in his *Methodus*, in his genus *Bæomyces*. It is, however, adopted by Michaux, Boreal. Amer. v. 2. 329, who deſcribes one ſpecies, H. *capitatum*, found in Carolina, growing on the earth.

HELOPS, in *Entomology*, a Fabrician genus of coleoptera. See PIMELIA.

HELOPS, in *Ichthyology*, the name of a fiſh which often occurs in the old Greek and Latin writers. Ariſtotle, Ælian, Ovid, and others, mention it. It ſeems to have been the ſame with their oniſcus, and accipeſius, which was our ſturgeon. Pliny's account of the helops countenances this opinion.

HELORUS, in *Ancient Geography*, a town of Sicily, near the mouth of a river of the ſame name.

HELOS, a town of Greece, in Laconia. See HELOTS.

HELOSIS, from ἑλίσσω, *to turn*, in *Surgery*, a turning out of the eye-lids. See ECTROPIUM.

HELOTIS, a name given by ſome authors to a diſeaſe called plica polonica.

HELOTIUM, in *Botany*, from ἕλος, *an excreſcence* or *fungus*. Perſ. Syn. 677. A genus of the natural order of *Fungi*, of which Perſoon gives the following character. *Receptacle* a convex hemiſpherical head, ſmooth on both ſides, elevated on a ſtalk.—He enumerates ſix ſpecies, of which the firſt will ſerve as an example.

H. *aciculare*. (Lectia acicularis; Perſ. Obſ. Mycol. v. 2. 20. t. 5. f. 1. t. 6. f. 1, 2. Helvella agariciformis; Sowerb. Fung. t. 57.)—Gregarious, white, permanent. Head rather concave when young.—Found on the rotten trunks of oaks in autumn. The whole fungus is white. *Stalk* from a line to half an inch in height, ſometimes divided. *Head* ſmaller than half a ſplit pea, ſometimes convex, ſometimes concave with a recurved edge, the whole reſembling a little Agaric, but without gills, and Perſoon has ſhewn, in his exquiſite figures, that the upper ſurface, or diſk, conſiſts of cloſe vertical cells, in each of which numerous concatenated elliptical minute ſeeds are lodged.

HELOTS, in *Antiquity*, a kind of ſlaves, among the Lacedæmonians, occupying a kind of middle ſtate between ſlaves and free citizens, ſo named from Helos, a Laconian town, conquered by the Spartans, who made all the inhabitants priſoners of war, and reduced them and their poſterity to the condition of ſlavery.

On theſe ſlaves lay the whole care of ſupplying the city with proviſions; the ground was tilled, and all manner of trades managed by them; whilſt their maſters ſpent all their time in dancing and feaſting, in their exerciſes, hunting-matches, and the λεσχαι, or places where good company uſed to meet. Theſe Helots farmed the lands of the Spartans; and in order to attach them to the ſervice of their maſters by the allurement of gain, they only paid a fixed rent, inferior to the produce, and which it would be diſgraceful in any proprietor of land to advance. They were alſo ſkilful mechanics; in time of war they ſerved as ſailors on board the fleet, and in the army, every oplites, or heavy armed ſoldier, was accompanied by one or more of them. Notwithſtanding the great uſefulneſs of the Helots, they were treated in a moſt barbarous manner, and often murdered without committing any fault, and without any ſhew of juſtice. Many of them have occaſionally been emancipated in recompence of their ſervices to the ſtate. But this benefit they could receive only from the ſtate; becauſe they belonged more to that than to the citizens whoſe land they cultivated; and on this account their maſters could neither give them their freedom, nor ſell them to foreign countries. Their enfranchiſement was performed by a public ceremony, in which they were led from one temple to another, crowned with flowers, and expoſed to the ſight of the people. They were afterwards permitted to dreſs as they pleaſed, and by new ſervices might be advanced to the rank of citizens.

As an apology for the ſeverity with which they were treated, it is ſaid, that many were governed with great difficulty; their number, their courage, and their riches rendered them daring and inſolent. However, the barbarity which was exerciſed towards them was ſo execrable as to have given occaſion to the proverb, that "at Sparta, the free man is the freeſt of all men, and the ſlave the greateſt of ſlaves." Pott. Archæol. Græc. lib. i. cap. 20. Travels of Anacharſis, vol. iv.

HELPITCH, in *Geography*, a town of the iſland of Ceylon; eight miles S. of Candy.

HELPS, in the *Manege*. To teach a horſe his leſſons, there are ſeven *helps* or aids to be known: theſe are, the *voice*, *rod*, *bit* or *ſnaffle*; the *calves* of the legs, the *ſtirrups*, the *ſpur*, and the *ground*. See AIDS.

The helps are occaſionally turned into corrections.

HELSINGBORG, in *Geography*, a ſea-port-town of Sweden, in the province of Schonen, on the coaſt of the Sound, oppoſite to Helſingoer. It was formerly fortified, but is now defenceleſs and has little commerce. Its manufactures are ribbons, hats, and boots. Here is a ferry acroſs the Sound to Denmark; 28 miles N.W. of Lund. N. lat. 56° 5'. E. long. 12° 30'.

HELSINGFORS, a ſea-port town of Sweden, in the province of Nyland, on the N. coaſt of the gulf of Finland, built by Guſtavus I. Its ſituation is romantic, on a riſing ſhore, near ſeveral rocks and huge fragments of granite. This is one of the beſt towns in the province, and is defended by ſeveral forts; particularly that called Ulricaberg, capable of containing 200 men, and another named Scatander-tyg, which can accommodate 400 ſoldiers; 140 miles E.S.E. of Abo. N. lat 60° 11'. E. long. 24° 56'.

HELSINGIC CHARACTER, a character inſcribed on ſome ſtones found in Helſingland, in the north parts of Sweden. It differs from the Runic; though one of theſe characters may eaſily be transformed into the other. See RUNIC.

HELSINGLAND, in *Geography*, a province of Sweden, in Norland, bounded on the N. by Jamtland and Medelpad, on the E. by the gulf of Bothnia, on the S. by Geſtricia, and on the S.W. and W. by Dalecarlia; about 120 miles long and 90 broad. It has but a ſmall portion of arable land, but it is fertile, and its paſtures feed a great number of cattle; flax is a principal article of cultivation: and the rivers and lakes abound with fiſh. The foreſts are extenſive, and furniſh a good ſupply of wood, for timber and for the uſe of the iron mines of the province. Its chief articles of commerce are iron, flax, linen, tallow, butter, tar, deals, timber, &c. The principal town is Hudwickſwall.

HELSINGO, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 63 46'. E. long. 22° 30'.

HELSINGOER, a town of Denmark, on the E. coaſt of the iſland of Zealand, built on the ſide of a mountain, near the ſound, and next to Copenhagen, the richeſt and moſt beautiful town of the iſland. At this place all mer-

chant

chant veſſels paſſing the Sound pay a duty, and therefore every nation that trades to the Baltic has its conſul here. This town has no harbour, but its road is ſafe and good; 20 miles N. of Copenhagen. N. lat. 55° 58'. E. long. 12° 37'.

HELST, Bartholomew Vander, in *Biography*, an excellent portrait painter, who was born at Haerlem in 1613. His pictures have the air of correct reſemblances, with great richneſs and truth of colouring and firmneſs of execution; their great defect is want of taſte and variety, and they appear laboured in their effect although clear in tone.

His chef d'œuvre is, or was, in the Chamber of Juſtice in the Town-houſe at Amſterdam. It repreſents the principal officers of the trained-bands of that city as large as life, well deſigned and executed with ornamental ſcenery, and vaſes of gold and ſilver. Sir Joſ. Reynolds, in his notes made during his journey in Flanders, ſpeaks in the higheſt terms of it, and gives the following account concerning it: "The beſt picture in the Stadthouſe is painted by Vander Helſt. It repreſents a company of trained-bands, about thirty figures whole length; among which the Spaniſh ambaſſador is introduced ſhaking hands with one of the principal figures. This is perhaps the firſt picture of portraits in the world, comprehending more of thoſe qualities which make a perfect portrait, than any other I have ever ſeen: they are correctly drawn, both head and figures, and well coloured; and have great variety of action, characters, and countenances; and thoſe ſo truly and lively expreſſive of what they are about, that the ſpectator has nothing to wiſh for. Of this picture I had before heard great commendations, but it far exceeded my expectation." Vander Helſt died in 1670, at the age of 57.

HELSTON, in *Geography*, is a large and populous borough and market-town in the hundred of Kerriar, and county of Cornwall, England, ſituated on the ſide of a hill, which ſlopes gradually to the little river Cober. The houſes are chiefly diſpoſed in four ſtreets, which meet near the centre and form a croſs: near the middle of the principal ſtreet are the market-houſe and town-hall. On an eminence to the north ſtands the church, which was erected about the year 1762, and from its elevated ſituation, and lofty pinnacled tower, forms a very fine object from many parts of the valley which lies between it and the ſea. Though this is one of the ſtannary towns, very little tin is now coined here. The old Coinage-hall is inhabited by an officer of the duchy, to which the manor originally belonged. The manor was ſold to redeem the land-tax in the year 1798, and was purchaſed by John Rogers, eſq. recorder of the borough. Leland mentions ſome veſtiges of a caſtle to be ſeen here in his time, but no part of it is now remaining.

Helſton has at different times received no leſs than fourteen charters. The firſt was beſtowed by king John, who made it a free borough, and granted it a guild mercatory. The privileges of holding a market and four annual fairs, and of returning two burgeſſes to parliament, were granted by Edward III., who alſo confirmed the former charters. The borough was originally incorporated by queen Elizabeth, and its government veſted in a mayor, four aldermen, and twenty-four freemen or aſſiſtants: but this number being reduced to one alderman and eight freemen, a new charter was granted in the year 1774, which determined the corporation to conſiſt of a mayor, five aldermen, a recorder, and an indefinite number of freemen. This charter met with great oppoſition from the remaining members of the old corporation, and occaſioned very ſingular law-proceedings; but is now conſidered as the only charter in force. Helſton is 276 miles diſtant from London. The population under the late return was 2248 perſons, inhabiting 313 houſes. At St. John's village, adjoining to the town, there was formerly a priory of knights of St. John of Jeruſalem; the remains of building were deſtroyed ſome years paſt, and a Methodiſt meeting-houſe erected on the ſcite.

About two miles from Helſton is Penroſe, the ſeat of John Rogers, eſq. This eſtate formerly belonged to the Penroſe family, from whom it deſcended to the preſent proprietor, who has made conſiderable additions to the old manſion, and planted and improved the grounds. A peculiar characteriſtic of the place is a large piece of water, called the Loe-pool, which forms one of the moſt extenſive lakes in the county, and is conſtituted ſuch by a ſingular operation of nature. The continual rolling of the waves of the Britiſh channel forces in a vaſt quantity of ſand and pebbles, which, by conſtantly accumulating, forms a very thick and high bank or dam, extending acroſs the valley, and by cloſing the mouth of the channel, occaſions the river to ſpread over a ſpace nearly ſeven miles in circumference. The waters being thus obſtructed, at length threaten to overflow the mills, and the whole of the lowlands. To prevent which the proprietors, ſanctioned by the mayor of the town, petitioned the lord of the manor for permiſſion to open a paſſage through the pebbly embankment: and having effected this the freſh-water ruſhes into the ocean with amazing force. Its effect is ſingular, and preſents an intereſting ſpectacle. The combination of rocks and woods around this lake is peculiarly pictureſque and grand.

In the pariſh of Sithney, about four miles N W. of Helſton, is a large pile of ſtones, the uppermoſt of which has long been known by the name of Mên-Amber, and was formerly a logan, or rocking ſtone. Borlaſe's Antiquities of Cornwall, folio; Polwhele's Hiſtory and Antiquities of Cornwall, 3 vols. 4to. and Beauties of England and Wales, vol. ii.

HELVE, the handle of a hatchet, pick-ax, mattock, &c. and to helve theſe is to put handles to them.

HELVELLA, in *Botany*, a word uſed by Cicero for ſome ſort of plant, capable of being dreſſed for the table, of which he ſpeaks in the ſame ſentence with *fungi* and herbs. Some have thought it a ſmall kind of cabbage, or pot-herb; Linnæus ſuppoſed it a fungus, akin perhaps to the morel; and in this ſenſe has made it the name of a genus; ſometimes he writes it *Elvela*, after the Italian authors.—Linn. Gen 568. Schreb. 769. Mart. Mill. Dict. v. 2. Perſ. Syn. Fung. 614. Hudſ Angl. 632. Juſſ. 4. Lamarck. Illuſtr. t. 885.—Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eſſ. Ch. Cap membranous, inflated, rather deformed, deflexed at each margin, ſmooth on both ſides.

Perſoon in his Synopſis enumerates but nine ſpecies of *Helvella*; one without any ſtalk; three with a furrowed ſtalk; and five with a ſmooth or even one.

1. H. *acaulis*, figured in Schæffer's Fungi, t. 153.—Seſſile, waved, expanded, reddiſh brown; paler and fibrous underneath. Found on the ground in fir foreſts. It grows either ſolitary or aggregate, one inch in diameter, or three or four. This is different from *H. acaulis* of Hudſon, which is an *Auricularia*; and we preſume alſo from *H. pineti* of Linnæus, which he ſays is frequent *on the ſtems* of firs, but of the latter we have not been able to come to any certain concluſion.

2. H. *Mitra*. Linn Sp Pl. 1649. Schæff. t. 154.—Cap tumid, many-lobed, of a blackiſh livid hue. Stalk furrowed and cellular, whitiſh.—This may ſerve for a ſpecimen of the ſecond ſection. It is not uncommon, growing on

Their capital was called *Albe*, according to Pliny. Their country correſponded to the preſent Vivarais.

HELVIR, in *Geography*, a town of Curdiſtan; 10 miles N. of Amadié.

HELVOETSLUYS, in *Geography*, a ſea-port town of Holland, on the S. ſide of the iſland of Voorn, with a good harbour, about 12 miles from the open ſea, in the middle of a large bay, capable of holding the whole fleet of the country; the town is ſmall but well fortified. This is the general port for packets from England, chiefly from the port of Harwich. In 1795, it was taken by the French; 15 miles S.W. of Rotterdam. N. lat. 52° 4'. E. long. 3° 58'.

HELWELLYN, or HELVELLYN, a mountain of England, in Cumberland; the height of which is eſtimated at 3324 feet above the level of the ſea. See MOUNTAIN.

HELWICK-HEAD, a cape of Ireland, in the county of Waterford, on the ſouth point of the entrance into Dungarvan bay. N. lat. 52° 2'. W. long. 7° 33' from Greenwich.

HELXINE, in *Botany*, a name uſed by ſome authors for the parietaria, or pellitory of the wall.

HELXINE, ἑλξίνη of Dioſcorides, of which he deſcribes two kinds in his fourth book. The firſt, chapter 39, a twining plant, with leaves like ivy, but ſmaller, whoſe juice is of a purgative quality, is ſaid to grow in hedges, vineyards, and corn fields. This has been taken for *Polygonum Convolvulus*, or *P. dumetorum*, and may perhaps be ſome ſpecies of *Convolvulus*. The ſecond, chapter 86, anſwers very well to *Parietaria officinalis*, for which it is generally taken, and which Dr. Sibthorp obſerved to be common throughout Greece and the Archipelago. Dioſcorides juſtly ſays that it grows on banks and walls; that the ſtems are ſlender and reddiſh; leaves like Mercury, hairy; and the little ſeeds, about the ſtem, rough, adhering to people's cloaths."

Linnæus in his earlier editions had a genus *Helxine*, which comprehended the *Fagopyrum* of Tournefort; but he afterwards, with unqueſtionable propriety, reduced it to his very natural genus *Polygonum*.

HELYOT, PETER, in *Biography*, a French friar, of the third order of St. Francis, was born at Paris in the year 1660. He embraced the eccleſiaſtical life in 1683, when he took the name of father Hippolytus. In the courſe of his miſſions he made two journeys to Rome, and travelled over the whole of Italy. In that country he projected, and made progreſs in a conſiderable work, entitled "A Hiſtory of the Monaſtic Orders, religious and military, and of the ſecular congregations of both ſexes, which have been eſtabliſhed to the preſent time, containing an account of their origin, foundation, progreſs, principal events, declenſion, ſuppreſſion, or reformation, and the lives of their founders or reformers, illuſtrated with engravings of their different habits." He was elected to ſeveral important poſts of his order, ſome of which gave him a good opportunity of collecting additional materials from the different inſtitutions which he viſited, and of finiſhing the compoſition of his work. In 1714 he began to print his hiſtory, which he did not live to ſee finiſhed. He died in 1716, when the fifth volume was in the preſs. Four other volumes were afterwards printed under the ſuperintendance of father Bullot, a member of the ſame ſociety. The whole work is held in conſiderable eſtimation, and an abridgment of it was publiſhed at Amſterdam in 1721, in four volumes, 8vo. Helyot was author of ſome devotional pieces, of which the moſt known is entitled "A View of the dying Chriſtian." Moreri.

HEM, a partition in the ovens, wherein the *lapis calaminaris*, or *calamine*, is baked. Theſe ovens have a hearth made on one ſide, divided from the oven itſelf by a partition, or hem, open at the top, by which the flame paſſes over, and ſo heats and bakes the calamine.

HEMARTHRIA, in *Botany*, ſo named by Mr. R. Brown, from ἡμισυς, *half*, and ἀρθρον, *a joint*; a genus eſtabliſhed by that ingenious writer in his Prodromus Nov. Holl. v. 1. 207, and conſiſting of ſuch ſpecies of *Rottbollia*, as have the *rachis* or common ſtalk of their ſpike but imperfectly jointed, ſo as ſcarcely to fall aſunder when ripe. One ſpecies is *R. Compreſſa*, Linn. Suppl. 114; another, found in Van Diemen's land, is named by him *H. uncinata*, from its inner glume being hooked.

HEMATITE *Red, Brown.* See IRONSTONE, *red, brown.*

HEMDA, in *Geography*, a town of Perſia, in the province of Irak; 80 miles E. of Iſpahan.

HEMELAR, JOHN, in *Biography*, was born at the Hague, and brought up to the church. In this he obtained preferment, and became canon in the cathedral of Antwerp. He is known for his Commentaries on the Imperial Medals from Julius Cæſar to Juſtinian. He died in 1640. Moreri.

HEMEL-HEMSTED, in *Geography*, is a reſpectable market town and pariſh in the hundred of Dacorum, Hertfordſhire, England. It is ſituated at a ſhort diſtance from the river Gade. The church, which ſtands in a ſpacious cemetery adjoining to the town on the weſtern ſide, appears to have been erected in the Norman era; but has been much altered and enlarged at ſubſequent periods. The weſtern entrance diſplays a finely ornamented receſſed arch, with two columns, and a half column on each ſide, ſupporting various mouldings, charged with diamonds, lozenges, roſes, and trefoils. The nave is ſeparated from the aiſles by a range of five maſſive columns on each ſide, and two half-columns, with ſquare capitals, variouſly ſculptured, and ſupporting round arches, having plain, zig-zag, and billetted mouldings. The town was incorporated by Henry VIII. who granted it a common ſeal and a pie-powder court during its market and fair. The market, which is held on Thurſday, is one of the moſt conſiderable in the county for grain; the market-houſe is a plain edifice of wood. The contiguity of the town to the Grand Junction Canal has already a beneficial effect on its trade. Among the charitable eſtabliſhments, the principal is the bequeſt of Mr. Thomas Warren, who, by will, dated December 2, 1796, provided for the ſupport of 50 poor widows, and for the endowment of two free-ſchools, one for 13 boys, the other for 15 girls. Hemel-Hemſted is 23 miles diſtant from London. Its population, as aſcertained under the late act, amounted to 2722; the number of houſes to 497.

Hemſted-Bury, or the Bury-houſe, at the bottom of the town, is a neat modern building, now the property of —— Hilton, eſq. a deſcendant from the ancient and noble family of Hilton, of Hilton Caſtle, in the biſhopric of Durham. Chauncy's Hiſtory, &c. of Hertfordſhire, and Beauties of England and Wales.

HEMERALOPIA, in *Medicine*, ſignifies, in the writings of the beſt ancient authors, *day-blindneſs*; that is, a diſeaſe of the eyes, which renders viſion extremely imperfect during the day, although after ſun-ſet that ſenſe becomes tolerably perfect.

This affection of the ſight, which is of very rare occurrence, ſtands in oppoſition to the *nyctalopia* of the ancients, or *night-blindneſs*, which appears to be a very common diſorder in warm climates. Modern writers in general, however, have uſed theſe terms in the contrary ſenſe; conſidering the *hemeralopia*

meralopia as denoting ſight during the day, and blindneſs in the night (*viſus diurnus*, in the tranſlation of Boerhaave); and *nyctalopia*, as expreſſing night-ſeeing, owl-ſight, as the French call it, and blindneſs during the day-time. Accordingly the derivation of the term, as ſtated by the latter, is from ἡμέρα, *the day*, and ὠψ, *the eye*, which they conceive to ſettle the meaning of the word as *day-ſight*; and in the ſame way nyctalopia is deduced from νὺξ, *the night*, and ὠψ, which coincides with the interpretation of *night-ſeeing*, or *viſus nocturnus*, as Boerhaave calls it. (De Morbis Oculorum, p. 161.) Some of the commentators and interpreters of Hippocrates have adopted the ſame view of the ſubject, and confounded the nyctalopia with the day-blindneſs (hemeralopia). See Foëſius in Œcon. Hippocrat. But Galen, the beſt interpreter of ſome difficult paſſages in Hippocrates, calls the nyctalopia "night-blindneſs;" and Aëtius, Paulus Ægineta, Actuarius, Pliny, and Celſus follow the ſame interpretation. Monſ. Dujardin, who adopts the ſame ſignication of the term, ſays that "Hemeralopia is derived from three Greek words, ἡμέρα, *the day*, ἄλως, *blind*, and ὠψ, *the eye*, meaning therefore *diurna cæcitudo*, or *diurnal blindneſs*; and in like manner nyctalopia, deduced from νὺξ, and the two other words, denotes *nocturnal* blindneſs." (See Journal de Medecine, tom. xix. p. 348.) In the ſame ſenſe Dr. Hillary (Obſ. on the Diſeaſes of Barbadoes, p. 298. ſecond edit.), Dr. Heberden (Medical Tranſactions, vol. i. art. 5.), and ſome other learned modern phyſicians, have employed the term. Indeed the true derivation of theſe terms ſeems to be from ἡμέρα and νὺξ reſpectively, with ἄλωψ, which conſiſts of ὠψ with the primitive α, and the λ introduced for euphony.

Dr. Hillary remarks that "the hemeralopia is a diſeaſe which is very ſeldom ſeen; they (the patients) ſee pretty well in the night, but very little in the day, and cannot ſee any thing when the ſun ſhines bright. It proceeds from a different and direct contrary cauſe of the other (nyctalopia), *viz.* from too great a tenderneſs and ſenſibility of the iris and retina; for they cannot bear any degree of light from the ſun to fall upon their eyes, but are obliged to ſhut their eyelids cloſe, and ſo near cloſed from the light of the day, when the ſun does not ſhine out, as not to be able to ſee; as we ſometimes ſee in an inflammation of the iris or retina, though no inflammation is preſent here, but too great a ſenſibility of thoſe parts, ſo that they cannot bear the light of the day, but can dilate the pupil of the eye, and ſee very well in the night. I have but had an opportunity of ſeeing two perſons who laboured under this diſeaſe." Little or nothing has been recorded reſpecting the means of curing this very rare diſorder. Dr. Hillary obſerves, that it has been ſaid that there are a people in Siam, in the Eaſt Indies, and alſo in Africa, who are all of this cat-eyed ſpecies, or ſubject to the diſeaſe of being blind in the day-time, and ſeeing well by night. (Mod. Univ. Hiſt. vol. vii.)

Sauvages affirms that the hemeralopia (in his nomenclature, called Amblyopia crepuſcularis) had, about two years before, been in ſome degree epidemic in the neighbourhood of Montpellier, in the villages in damp ſituations adjoining the rivers, and particularly affecting the ſoldiers, who ſlept in the open damp air. They were cured, he ſays, by bliſtering, together with emetics and cathartics, and other evacuants. (Noſol. Method. Claſs VI. Gen. III. Spec. I.)

Boerhaave has mentioned a variety of this diſeaſe, occaſioned by an immoveable contraction of the pupil; for which, however, he could not ſuggeſt any ſafe or probable remedy, eſpecially as the diſeaſe occurred principally in old people.

Profeſſor Scarpa, who has a chapter on the ſubject of hemeralopia, which he conſiders as a partial amauroſis, has fallen into the common error of confounding it with night-blindneſs. (Obſervations on Diſ. of the Eyes, tranſlated by Briggs, p. 499.) See NYCTALOPIA.

HEMEROBAPTISTS, a ſect among the ancient Jews, thus called from their waſhing and bathing every day, in all ſeaſons; and performing this cuſtom with the greateſt ſolemnity, as a religious rite neceſſary to ſalvation. Epiphanius, who mentions this as the fourth hereſy among the Jews, obſerves that in other points theſe heretics had much the ſame opinions as the Scribes and Phariſees; only that they denied the reſurrection of the dead, in common with the Sadducees, and retained a few other of the improprieties of theſe laſt.

The ſects who paſs in the Eaſt under the denomination of Sabians, calling themſelves *Mendai Iihai*, or the diſciples of John, and whom the Europeans entitle the Chriſtians of St. John, becauſe they yet retain ſome knowledge of the Goſpel, are probably of Jewiſh origin, and ſeem to have been derived from the ancient Hemerobaptiſts; at leaſt it is certain, that John, whom they conſider as the founder of their ſect, bears no ſort of ſimilitude to John the Baptiſt, but rather reſembles the perſon of that name, whom the ancient writers repreſent as the chief of the Jewiſh Hemerobaptiſts. Theſe ambiguous Chriſtians dwell in Perſia and Arabia, and principally at Baſſora; and their religion conſiſts in bodily waſhings, performed frequently, and with great ſolemnity, and attended with certain ceremonies, which the prieſts mingle with this ſuperſtitious ſervice. Moſheim's Eccl. Hiſt. vol. iii.

HEMEROBIUS, in *Entomology*, a genus of Neuroptera. The mouth is armed with a ſhort horny mandible; the jaw cylindrical, ſtraight, and cleft; feelers four, unequal, and filiform; ſtemmata generally none; wings deflected and not folded; antennæ ſetaceous, projecting, and longer than the thorax, which is convex.

Fabricius divides the Linnæan genus Hemerobii into two genera, Hemerobius and Semblis; and by ſome late writers they are again ſeparated into a greater number, as Hemerobius, Oſmylus, Corydalis, Chauliodes, and Sialis. The true Hemerobius has no diſtinct ſtemmata; and this, in addition to the general character of the Hemerobini appears very characteriſtic. This genus is well exemplified in the Linnæan ſpecies Hemerobius perla. The Fabrician Hemerobius maculatus, a ſpecies in which the ſtemmata are very diſtinct, Latreille calls Oſmylus. In Corydalis (Hemerobius cornutus of Fabricius) the wings reſt horizontally; the antennæ are ſimple; and the mandibles very long, and advanced forward. The wings likewiſe reſt in a horizontal poſition in Chauliodes, but in this the antennæ are pectinated inſtead of ſimple, and the mandibles are neither very long, nor advanced forward; and, laſtly, in Sialis the wings, when at reſt, are diſpoſed in a roof-like form, the wings being deflected, expanding a little beneath, and meeting together in a longitudinal line at the dorſal future; the antennæ are ſimple, and the laſt joint but one of the feet bilobate. Schæffer had long before obſerved that in the genus Hemerobius the abdomen grows ſlender towards its extremity, that the wings are in ſome ſubjects incumbent, and in others deflected, and the feet compoſed of five joints.

Many of the inſects referred to the above-mentioned tribes occur in marſhy places near ſtanding pools of water, and ſometimes in woods, or, more frequently, in fields and gardens. Theſe inſects have a very remarkable and unpleaſant ſmell, as we find in the ſpecies *perla*, a kind of Hemerobius called in England the "thunder fly," from the powerful ſcent it emits, and, as it is vulgarly ſuppoſed, at the approach

of a thunder ſtorm. The term of their exiſtence is very ſhort, and in every ſtate of life they prey with unceaſing avidity on plant lice, for which reaſon they are beneficial to horticulture; they alſo ſubſiſt on other inſects, and not unfrequently devour one another. The larvæ are generally ovate and hairy, and are furniſhed with ſix feet; the pupa moſtly folliculate. The eggs are depoſited each upon a diſtinct gummy pedicle, in cluſters upon the leaves of plants. The ſpecies deſcribed below are Hemerobii of Gmelin, including the two Fabrician genera, Hemerobius and Semblis, and are diſtributed nearly in the order in which they are placed by Fabricius.

Species.

GRANDIS. Wings ſomewhat equal and reticulated with veins, and marked with two yellowiſh ſpots. Thunb.

Native of Japan; the body oblong and yellowiſh; antennæ and jaws black.

CORNUTUS. Mandibles projecting, and horn-ſhaped. Fabr. *Raphidia cornuta*, Linn.

Inhabits North America; very large; body ferruginous.

PERLA. Wings hyaline with green veins; body yellowiſh-green; eyes golden. Geoffr. Linn. &c. *Golden-eye, or thunder-fly*, Donov. Br. Inſ.

Common in gardens during ſummer, and is a very delicate and elegant little inſect; the head and body, with the legs, pea-green, the eyes brilliant, and reſembling dots of molten gold, and the wings the texture of fine gauze. The length, when the wings are cloſed, about an inch. The bite of this ſpecies is acute.

FILOSUS. Cinereous; wings whitiſh; antennæ very long. Fabr.

Native of the iſland of Otaheite, deſcribed from the Bankſian cabinet. Its ſize rather larger than the laſt; antennæ ſetaceous and twice the length of the body; body and wings without ſpots.

ALBUS. White; wings hyaline; eyes braſſy. Linn.

According to Linnæus this is allied to Hemerobius perla, and is found on plants in Sweden.

CAPITATUS. Fuſcous; head and forepart of the thorax teſtaceous; wings white, with reticulated nerves. Fabr. *Hemerobius flavus*, Scop.?

Native of Germany; wings ſhaded greeniſh, and a common elongated brown ſpot.

CHRYSOPS. Wings hyaline with green veins, and brown ſpots; body variegated black and green. Linn. *Spotted hemerobius*, Donov. Br. Inſ.

Inhabits woods in Europe, a rare ſpecies.

MACULATUS. Wings white, upper-pair ſpotted with black; body black. Fabr.

Native of France. Head and legs ſomewhat teſtaceous.

NITIDULUS. Wings ſtriated and cinereous; body teſtaceous; legs pale. Fabr.

Antennæ brown; eyes black. The ſpecies inhabits Germany.

PHALÆNOIDES. Wings mucronate at the baſe, and cut behind. Linn.

Wings teſtaceous, with an oblique brown ſtreak and dot. Found in Europe.

HIRTUS. Wings hairy, reticulated with brown; lower ones with a terminal band. Degeer, &c. *Hairy hemerobius*, Donov. Br. Inſ.

Native of Europe; ſize moderate.

FUSCATUS. Wings ſtriated, brown, hyaline; body black; legs teſtaceous. Fabr.

Rather ſmaller than the laſt, and inhabits Denmark and France.

LUTESCENS. Wings white with brown ſtreaks; body yellowiſh. Degeer.

Inhabits Kiel.

HUMULI. Wings white, with ſcattered brown dots; antennæ annulated with white and black. Linn.

Found in the hop plantations at Upſal.

LONGICORNIS. Black, mouth and legs pale, antennæ brown and long. Fabr.

Inhabits Holſace.

STRIATULUS. Wings ſtriated with brown; lower ones immaculate; body brown and yellow. Fabr.

Found in gardens in Europe. The head is yellow; mouth and eyes brown; thorax brown; breaſt and legs yellow; abdomen brown with the ſides yellow.

8-PUNCTATUS. Wings white, with two brown dots on each. Fabr.

Native of Cochinchina. Body yellowiſh.

FASCIATUS. Wings white, with three bands and numerous ſpecks of black. Fabr.

Inhabits Kiel. The antennæ are black; head and thorax yellow with brown marks; abdomen black; lower wings white and immaculate.

NERVOSUS. Fuſcous; crown of the head and thorax at the back yellowiſh; wings variegated, the nerves dotted with white. Fabr.

Native of France.

Size of H. hirtus; antennæ yellowiſh, with black rings; head black except the yellowiſh crown; abdomen black; legs yellowiſh.

VARIEGATUS. Wings white with black ſpots, the nerves dotted; body brown. Fabr.

Inhabits France.

6-PUNCTATUS. Wings white with fuſcous ſpots, and ſix diſtinct dots behind; antennæ brown. Linn.

Inhabits Europe in gardens.

PICICORNIS. Black; upper wings white and fuſcous varied; antennæ long and hairy. Fabr.

A ſmall ſpecies found in Denmark. The body is black and without ſpots; lower wings white and without ſpots, and the legs pale.

FLAVICANS. Black, thorax and abdomen yellow.

An European ſpecies.

2-PUNCTATUS. Wings with two black dots; body varied with brown and yellow. Linn.

Found in gardens in Europe.

4-PUNCTATUS. Wings white with four black dots at the baſe, the tip radiated with brown. Fabr.

A ſmall ſpecies found at Kiel.

ABDOMINALIS. Fuſcous with yellow abdomen; vent black. Fabr.

Taken by Fabricius in the month of Auguſt in Norway. The ſpecies alſo inhabits England. Its ſize is ſmaller than that of a flea.

TESTACEUS. Wings black, thrice as long as the body; body brown, beneath teſtaceous. Degeer, &c.

Native of America.

PAGANUS. Wings white; upper-pair with faint duſky bands; antennæ white. Linn.

Inhabits Upſal.

FLAVUS. Yellow; mouth blood-red each ſide. Linn.

This and the two following are European ſpecies.

MELANOSTICOS. Yellowiſh; wings hyaline, varied with blue and golden, the nerves whitiſh dotted with black, the margins with minute black dots. Linn.

VERSICOLOR. Yellow; wings hyaline, varied with blue and golden, baſe of the abdomen beneath and tail black; antennæ yellow. Linn.

The

The ſucceeding ſpecies belong to the Fabrician genus Semblis.

Pectinicornis. Antennæ pectinated; wings white with brown marks, and nerves ſomewhat articulated with white. Degeer.

Native of South America.

Griseus. Wings grey ſpotted with white. Fabr.

Inhabits Africa. The head and thorax ferruginous varied with black; lower wings black at the baſe.

Atratus. Wings whitiſh; upper pair ſpotted with black; body black. Fabr.

Native of Africa. The head black; front covered with cinereous hair; thorax black and hairy, with a cinereous line each ſide; abdomen black, with an oblong teſtaceous ſpot towards the tip.

Punctatus. Brown; wings white ſpotted with brown; the nerves dotted with white and black. Fabr.

Country unknown.

Fuscatus. Wings brown ſpotted with white; poſterior ones black at the baſe. Fabr.

Inhabits the Eaſt Indies. The head ferruginous; mouth black; thorax duſky.

Lutarius. Black; wings ſtriated whitiſh ſpotted with white. Degeer.

Native of Europe.

HEMEROCALLIDEÆ, in *Botany*, a natural order of plants eſtabliſhed by Mr. R. Brown, Prod. Nov. Holl. v. 1. 295, and named from the *Hemerocallis*, which makes one of them. It conſiſts of the 1ſt ſection of Juſſieu's *Narciſſi*, except *Gethyllis*, and ſome of his *Aſphodeli* with a tubular corolla; or perianthium, as both theſe writers eſteem it. The characters are

Perianth (rather corolla) tubular, coloured, its limb in ſix diviſions. Stamens ſix, inſerted either into the tube, or the baſe of the ſegments. Germen ſuperior, of three cells, with many ſeeds. Style one. Stigma either three-lobed or ſimple. Capſule, (rarely a berry,) of three cells and three valves. Seeds with their outer coat neither of an opaque black nor cruſtaceous, but often ſpongy and dilated or winged. Albumen fleſhy.

The author ſuggeſts that perhaps the plants in queſtion ought rather to form a ſection of the *Liliaceæ*, than a diſtinct order, and that they ſcarcely differ from what are ſtrictly ſo called, the *Lilia* of Juſſieu, except in their tubular flowers.

The only New-Holland genus of this order or ſection is *Blandfordia*, Sm. Exot. Bot. v. 1. 5. t. 4, confounded with *Aletris* by La Billardiere, in his Nov. Holl. v. 1. 85. and in his voyage, Engliſh ed. v. 1. 160.

HEMEROCALLIS, from ἡμερα, *a day*, and καλλος, *beauty, a beauty of a day*, expreſſive of the ſhort duration of the flowers. This is correctly applicable to the Linnæan genus, of which we are to treat, but the ἡμεροκαλλις of Dioſcorides is a bulbous plant, and his deſcription anſwers rather to ſome ſpecies of *Lilium*; we ſhould think the *bulbiferum*, or orange lily, if that were a native of Greece. Dr. Sibthorp took the plant of Dioſcorides to be *L. calcedonicum*, the ſcarlet martagon, found wild in the woods of Mount Parnaſſus; but this does not appear quite ſatisfactory.—Linn. Gen. 172. Schreb. 228. Willd. Sp. Pl. v. 2. 197. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 1. 473. Juſſ. 54. Lamarck. Illuſtr. t. 234. Gærtn. t. 83, but not t. 179.—Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Coronariæ*, Linn. *Narciſſi*, Juſſ.—See Hemerocallideæ.

Gen. Ch. *Cal.* none. *Cor.* in ſix deep ſegments, between bell and funnel-ſhaped; tube ſhort; limb ſpreading, the upper ſide moſt reflexed. *Stam.* Filaments ſix, awl ſhaped, the length of the corolla, declining, the upper ones ſhorteſt; anthers turned upwards, oblong, incumbent. *Piſt.* Germen ſuperior, roundiſh, furrowed; ſtyle thread-ſhaped, of the length and poſition of the ſtamens; ſtigma turned upwards, bluntly triangular. *Peric.* Capſule triangular, ſwelling, ſomewhat three-lobed, of three cells, and three valves. *Seeds* numerous, roundiſh, without wings, ſmooth, and of a ſhining black.

Eſſ. Ch. Corolla funnel-ſhaped, with a cylindrical tube. Stamens declining. Capſule of three cells. Seeds numerous, roundiſh, poliſhed, without wings.

Obſ. From this genus muſt certainly be ſeparated the *H. lancifolia* and *japonica* of Thunberg and Willdenow; the former of which is *H. alba*, Andr. Repoſ. t. 194, and the latter *H. cærulea*, t. 6. Curt. Mag. t. 894. Theſe form a moſt diſtinct genus, with broad and ribbed leaves, very different in habit from *Hemerocallis*; the limb of its corolla more bell-ſhaped than funnel-ſhaped, and the ſeeds affording an excellent eſſential character, being winged. See Sm. Intr. to Bot. 362; and Gærtner, t. 179, *Hemerocallis cordata*, which is the above *cærulea*, a plant whoſe nomenclature has been remarkably multiplied and confuſed, and that of the *alba* ſtill more, by Thunberg himſelf. Mr. Saliſbury has propoſed, in Tr. of Linn. Soc. v 8. 11, to call this new genus *Sauſſurea*, to which there can be no poſſible objection. The fine ſpirial veſſels, as he tacitly indicates, render it peculiarly proper to commemorate M. de Sauſſure, ſo eminent a writer on the anatomy and phyſiology of plants.

The real ſpecies of *Hemerocallis* are

1. H. *flava*. Yellow Day-lily. Linn. Sp. Pl. 462. Curt. Mag. t. 19. Jacq. Hort. Vind. t. 139. Redout. Liliac. t. 15. (Lilium non bulboſum; Ger. Em. 98.)—Leaves linear, keeled. Segments of the corolla flat, acute, with unbranched ribs.—Native of open fields in Dalmatia, Hungary, and Switzerland; hardy and very common in our gardens, where it bloſſoms in June, and is eſteemed for its ſweet and rich fragrance, as well as beauty.

The *root* is perennial, furniſhed with ſtalked ovate knobs, and thrives beſt in a rather moiſt ſoil. *Leaves* ſeveral, radical, a foot or more in length, nearly erect, of a deep graſs-green, ſmooth, linear, acute, nearly flat, except the keel. *Flower-ſtalks* taller than the leaves, erect, round, panicled in a corymboſe manner at the top, with alternate, long, lanceolate, pale *bracteas*. *Flowers* of a golden yellow, funnel-ſhaped; their ſegments acute, recurved; the three inner ones broadeſt, but ſcarcely at all waved or uneven, the ribs of all ſimple to the end. Linnæus could find no ſpecific difference betwixt this and *fulva* but the colour of their flowers, at leaſt when he wrote his *Species Plantarum*. Willdenow has been far more ſucceſsful, and we have adopted his definition above.

2. H. *graminea*. Narrow-leaved Day-lily. Andr. Repoſ. t. 244 Curt. Mag. t. 873. (H. flava β; Willd. Sp. Pl. v. 2. 197. H. minor; Mill. Dict. ed. 8.)—Leaves channelled, nearly triangular. Bracteas ſhort and membranous. Corolla rather ſwelling at the baſe; its inner ſegments criſped at the edge. Stigma three-lobed.—Native of Siberia, from whence Mr. Loddige obtained the ſeeds. It is hardy with us, but the flowers being ſcarcely fragrant, though of a richer yellow than the foregoing, render it not on the whole ſo deſirable. The *leaves* are narrower, ſhorter and darker, their edges more raiſed, ſo as to form a channel. *Stalk* much leſs branched; *flowers* rather larger, and *ſtyle* much longer. Other differences are noted in the ſpecific character. Parkinſon in his *Paradiſus*, 149, draws the yellow Day-lily with tumid flowers, like this, but the broad leaves, even ſegments of the corolla, long ſtyle, and numerous

rous flowers, ſurely agree beſt with the former. We obſerve alſo ſome ambiguity in Redouté's figure of the *flava*, but have no doubt of his ſpecies.

3. H. *fulva*. Tawny Day-lily. Linn. Sp. Pl. 462. Curt. Mag. t. 64. Redout. Liliac. t. 16. (Lilium non bulboſum phœniceum; Ger. Em. 98.)—Leaves linear, keeled. Three inner ſegments of the corolla obtuſe, waved; their ribs branched at the margin. Suppoſed by Linnæus to be a native of China. It is an old and very hardy inhabitant of our gardens, flowering in July and Auguſt, and is larger in every part than the firſt ſpecies, without any ſcent in the flowers, which continue but a few hours, and are of a tawny or orange hue. The *leaves* are rather broad, of a fine green, particularly pale and delicate in the ſpring. *Capſules* ſcarcely ever ripened in England, but the roots form large faſt-encreaſing tufts, calculated for large gardens or ſhrubberies, eſpecially where the ſoil is rather moiſt.

We apprehend a great miſtake in the report of this ſpecies having ever changed to *flava*; ſee Tr. of the Linn. Soc. v. 2. 353.

HEMEROCALLIS, in *Gardening*, comprehends plants of the herbaceous, flowering, perennial kinds, of which the ſpecies principally cultivated are, the yellow day-lily (H. flava); and the copper-coloured day-lily (H. fulva.)

The firſt of theſe ſpecies has a variety with ſmaller roots, ſhorter and more narrow leaves, which are of a dark green colour, and ſomewhat bell-ſhaped yellow flowers.

Method of Culture.—Theſe hardy plants are increaſed with little difficulty, by means of planting the root off-ſets in the autumn in almoſt any ſituation. Afterwards, they ſtand in need of no other ſort of cultivation but that of keeping them quite free from weeds, and letting them have ſufficient room for their roots to extend themſelves in.

The firſt ſpecies is alſo capable of being multiplied by the ſeeds, which ſhould be put into the ground in the autumn. In the following ſpring the young plants preſent themſelves, and become capable of flowering in the courſe of two years.

The moſt ſuitable ſoil for the different ſorts is that which is inclined to be a little moiſt, and where the ſituation is of a ſhady nature. In conſequence of their ſize, and the rapid increaſe of their roots, eſpecially in the latter kind, they become beſt adapted to large pleaſure-grounds and gardens, in which they afford conſiderable variety and effect.

HEMERODROMI, compounded of ἡμέρα, *day*, and δρόμος, *courſe*, &c. among the *Ancients*, were centinels, or guards, appointed for the ſecurity and preſervation of cities, and other places.

They went out of the city every morning, as ſoon as the gates were opened, and kept all day patrolling round the place; ſometimes, alſo, making farther excurſions into the country, to ſee that there were no enemies lying in wait to ſurpriſe them.

HEMERODROMI were alſo a ſort of couriers, who only travel'ed one day, and then delivered their packets, or diſpatches, to a freſh man, who run his day, and ſo on, to the end of the journey.

The Greeks had this ſort of couriers, which they derived from the Perſians, who were the inventors thereof, as appears from Herodotus. Auguſtus had the ſame; at leaſt, he eſtabliſhed couriers, who, if they did not relieve each other from day to day, yet did it from ſpace to ſpace, and that ſpace was not very great.

HEMEROTROPHIS, in *Antiquity*, a meaſure of capacity, the ſame with the choenix.

It was ſo called from its holding one day's food.

The word is compounded of ἡμέρα, *a day*, and τροφὴ, *food*.

HEMI, a word uſed in the compoſition of divers terms. It ſignifies the ſame with *ſemi* or *demi*, viz. *half*; being an abbreviature of ἥμισυς, *hemiſys*, which ſignifies the ſame. The Greeks retrenched the laſt ſyllable of the word ἥμισυς, in the compoſition of words; and, after their example, we have done ſo too, in moſt of the compounds borrowed from them.

HEMI, a Greek word much uſed in *Muſic*, implying *half*. See SEMI and DEMI.

HEMIANDRA, in *Botany*, from ἥμισυς, *half*, and ἀνὴρ, *a man*, becauſe the anthers have only one perfect or polliniferous lobe. Brown. Prodr. Nov. Holl. v. 1. 502.—Claſs and order, *Didynamia Gymnoſpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Eſſ. Ch. Calyx compreſſed, two-lipped; the upper lip undivided; the lower cloven half way down. Corolla two-lipped; the upper lip flat and cloven; lower in three deep ſegments, the middle one cloven. Stamens aſcending. Anthers each with one empty deſcending lobe. *Brown.*

1. H. *pungens*, the only ſpecies. Found by Mr. Brown on the ſouth coaſt of New Holland. A humble decumbent *ſhrub*, with oppoſite, entire, ribbed, pointed *leaves*. *Flowers* axillary, ſolitary, their ſtalks with a pair of bracteas at the top. Lips of the *calyx* ribbed, their ſegments pointed. *Corolla* white, ſtained or dotted with purple.

HEMICHROA, (ἡμίχροα, *half-green*,) ſo called becauſe the calyx, uſually quite green in the natural order to which this plant belongs, is here coloured on the inſide. Brown. Prodr. Nov. Holl. v. 1. 409.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Holeraceæ*, Linn. *Atriplices*, Juſſ. *Chenopodeæ*, Decandolle, Brown.

Eſſ. Ch. Calyx inferior, deeply five-cleft, coloured on the inſide; unchanged in the fruit. Stamens five or fewer, united at the baſe. Seed compreſſed, encloſed in a membranous cover. Embryo ſemi-lunar. Radicle inferior, aſcending.

1. H. *pentandra*. Stamens five. Bracteas but half the length of the calyx. Native of the ſea-ſhore, on the ſouth coaſt of New Holland, and in Van Diemen's land.

2. H. *diandra*. Stamens two. Bracteas but little ſhorter than the calyx.—Found on the ſea-ſhore, on the ſouth coaſt of New Holland.

Theſe are ſhrubby plants, with alternate, ſemi-cylindrical *leaves*. *Flowers* axillary, ſolitary, ſeſſile, with a pair of bracteas to each. The genus is much allied to *Polycnemum*.

HEMICRANIA, in *Medicine*, from ἥμισυ, *half*, and κρανίον, the *cranium* or *ſkull*, ſignifies that form of head-ache which is confined to one ſide of the head.

The term, however, is not excluſively applied to affections of the whole, or even the greater part, of the ſide of the head; but includes thoſe ſpecies of head-ache which are often confined to one ſmall and circumſcribed ſpot, but which conſtitute perhaps the moſt ſevere and painful forms of the diſeaſe; ſuch are the *clavis hyſterica*, the *tic douloureux*, the *megrim*, &c. Theſe modifications of head-ache, and eſpecially the laſt-mentioned, are often periodical in their returns; whence they have been called intermittent head-aches and *agues in the head*. Hemicrania is thus defined by Sauvages: "Eſt morbus cujus præcipuum ſymptoma dolor eſt in alterutro capitis latere potiſſimum ad tempora, frontem juxta oculos, iſque vehemens, ſæpe periodicus." (Noſol. Method. Claſs 7. Gen. 13.)

One of the common forms of hemicrania is the attack of rheumatiſm

rheumatiſm in the face and head, which is often called the face ache. This complaint appears to commence ſometimes in the gums, ſometimes in the muſcles of the face and neck, and ſometimes in the integuments of the ſide of the cranium, which is affected. It is attended with ſome ſwelling of the cheek or gums; with extreme ſorenefs of theſe parts and of the ſcalp, ſo that even the operation of a comb is ſcarcely tolerable upon the ſurface of the latter; and with exquiſite ſenſibility to the impreſſion of cold. Some febrile heat, increaſed quickneſs of the pulſe, foulneſs of the tongue, thirſt, and other ſymptoms of pyrexia, accompany the diſorder; and the ſleep is greatly diſturbed by the violence of the pain, which, as in other forms of rheumatiſm, is generally moſt ſevere in the night. This appears to be the hemicrania *odontalgica* (ſpec. 2.) of Sauvages. The pain, in fact, is frequently referred by the patients themſelves to ſome ſuppoſed diſeaſe of the teeth; and very often one tooth after another has been drawn in the hope of alleviating the diſorder of the head; but too often without any beneficial effect. At the ſame time, the nature of the complaint frequently is elucidated by the occurrence of rheumatic pains and ſwellings in the limbs or joints, which are the ordinary ſeat of rheumatiſm.

This variety of hemicrania, like the other modifications of rheumatiſm, is often extremely obſtinate, and reſiſts the influence of medicine for a conſiderable length of time. It is ultimately, however, relieved by the remedies which are beneficial in that diſeaſe; and it is likewiſe aggravated by the ſame treatment, which has been found to be injurious in other febrile rheumatic attacks. (See RHEUMATISM.) It may be ſufficient to mention here, that a free uſe of diaphoretics, with gentle laxatives of the ſaline claſs, appears to be the moſt advantageous method of treatment in the early ſtages of the rheumatic hemicrania. The moſt effectual diaphoretics are opium combined with antimony, or with ipecacuanha and a neutral ſalt, as in that very uſeful formula deviſed by Dr. Dover; and the conſtipation, which in many conſtitutions concurs with the taking of theſe medicines, may be advantageouſly obviated by the ſulphate of magneſia, with or without a ſmall quantity of the ſubmuriate of mercury or calomel. Nothing is more common, than to reſort to warm fomentations of the part affected, with a view to relieve the violence of the pain; but we believe, the diſappointment is invariable, as we have never ſeen any local inflammatory rheumatiſm alleviated by ſuch applications; on the contrary, it is uſually aggravated by them. Nor is the employment of ſtimulant frictions, ſuggeſted perhaps on the falſe analogy of chronic rheumatiſm, more beneficial. When the febrile irritation begins to ſubſide, the cinchona, caſcarilla, or other aromatic bitter ſubſtance, will contribute to accelerate the amendment of the patient.

Another variety of hemicrania, which is much leſs frequent, is occaſioned by ſome diſeaſe or irritation in the ſmall cavities, or *ſinuſes*, as they are technically called, in the ſkull, and which communicate with the paſſages of the noſtrils. Theſe are principally four; two in the projecting portion of the forehead, above the inner angles of the eyes, called the frontal ſinuſes; and one in each cheek-bone or upper-jaw, termed the *antrum* of Highmore. (See CRANIUM.) Theſe little cavities are liable to become the ſeat of inflammation and ſuppuration from various cauſes, like other parts of the body; eſpecially, 1ſt. From the extenſion of inflammation from the lining membrane of the noſe to that of theſe cavities, as in *coryza* or *catarrh*, (the hemicrania *coryzæ*, ſpec. 4, of Sauvages,) in which they become infarcted with a thick mucus; 2dly. From external violence, as from blows or wounds upon the head near theſe cavities, (the H. purulenta, ſpec. 7 of the ſame noſologiſt); and, 3dly. From the preſence of inſects or their *larvæ* in the cavities, (H. *ab* inſectis, ſpec. 8.—and H. *ſinûs*, ſpecies 3.) of which there are many examples on record.

It is well known that there are ſome inſects for which no other nidus appears to have been provided by nature, than the cavities and canals in the bodies of more perfect animals. Of theſe the *æſtrus* is a common example; and of the five ſpecies enumerated by Linnæus, three are hatched and nurtured in the ſtomach and rectum of the horſe and cow, and in the frontal and maxillary ſinuſes of the horſe and ſheep. The larvæ of theſe flies are called BOTTS, of which an ample account has already been given under that head. In the human ſubject the æſtrus has alſo been known to inſinuate its eggs; and one of the moſt excruciating attacks of headache that has been recorded, originated in a woman, from the preſence of two or three botts in the *antrum* of the cheek. (See a caſe by Dr. Heyſham, Med. Communications, vol. i. p. 430.) Various *erucæ*, or caterpillars, have been occaſionally found in, and diſcharged from, the ſinuſes. (See Fernelius, 5. Patholog. cap. 7. Rolfinc. de capit. dolore, &c.) The larvæ of the common houſe-fly, and of the black beetle, have alſo been inmates of the human body, and occaſionally have been diſcharged from the noſtrils. (See a paper by Dr. Bateman, in the Edin. Med. and Surg. Journal for 1811, with the references there mentioned.) In theſe caſes there is a conſtant fixed pain in the inferior part of the forehead, over the eye, or in the cheek, the ſeat of which may be covered with the finger, and which is occaſionally aggravated to an extreme degree by various cauſes, ſuch as heat and cold, ſudden motion, eating, ſpeaking loud, &c. The eyes, eſpecially that of the ſide affected, are often inflamed, and diſcharge tears, particularly during the paroxyſms of increaſed pain. The paſſages of the noſe are ſometimes dry, and there is frequent ſneezing; but ſometimes there is an increaſed diſcharge of mucus. When theſe morbid conditions of the ſinuſes continue very long, as is uſual, the conſtitution is greatly injured by the inceſſant ſuffering, and great failure of ſtrength and emaciation ſometimes enſue.

It is obvious, however, that the diagnoſis of theſe caſes, in which the preſence of inſects in the cavities alluded to occaſions the diſeaſe, muſt be extremely difficult and obſcure; and, eſpecially when the frontal ſinuſes ſuffer, the means of relief are ſcarcely within our power. The acts of ſneezing and of vomiting have ſometimes produced the diſcharge of the inſects, and errhines and emetics have been adminiſtered with ſuch a view; but often theſe acts, and particularly that of ſneezing, have greatly augmented the ſufferings of the patient. In caſe the maxillary ſinus ſhould be the ſeat of the diſeaſe, which the ſeat of the pain may lead us to preſume, that cavity may be pierced from the alveolum of a tooth, and its contents evacuated. In this way the botts were diſcharged, in the caſe detailed by Dr. Heyſham.

There is a third form of hemicrania, which is not an unfrequent occurrence, and which is popularly known by the appellation of *megrim*. This word, however different it may appear at firſt ſight, is doubtleſs derived from the word *hemicrania*, through the medium of the French; who of *hemicraine* have formed *migraine*, whence our *megrim*. This diſeaſe, though ſlightly mentioned by ſeveral writers, has not been generally deſcribed; ſome obſervations made by the writer of this article, from experience of the affection in his own perſon, as well as in others, were publiſhed in the Edinburgh Medical and Surgical Journal for July 1805, (ſee vol. v. p. 381,) and which he will take the liberty of

quoting

quoting. This very painful affection, although not uncommon, has ſeldom been mentioned by medical writers, or has been confounded with the *tic douleureux*. It conſiſts of a pain near the inner angle of the orbit of the eye, beginning in the point of the ſupra-orbital foramen, (through which the firſt branch of the fifth pair of nerves paſſes out,) and extending a little way on the ſide of the noſe, affecting alſo the eye of the ſame ſide, which becomes red, painful, and more ſenſible to light during the paroxyſm. This pain is exceedingly acute, and each pulſation of the ſupra-orbital twig of the artery is painfully felt. The ſeat of the pain may be generally covered with the point of the finger, and preſſure gives momentary relief; the throbbing pain, however, becomes ſpeedily more ſevere under the preſſure. The integuments become tender during the paroxyſm, and remain ſo in ſome degree during the intermiſſion; indeed, when the diſorder has continued ſeveral days, the ſkin of all that ſide of the forehead, which is ſupplied by the ſupra-orbital nerve, becomes tender to the touch. This pain is perfectly intermittent. After a duration of two or three hours, ſometimes much longer when the diſeaſe is of conſiderable ſtanding, the pain gradually diminiſhes, and ſoon ceaſes; but it returns again, ſometimes moſt exactly at the ſame hour on the ſucceeding day. The moſt uſual period of the paroxyſm is in the morning; but we have ſometimes obſerved it to recur in the evening. Dr. Darwin ſays that the periods ſometimes correſpond with alternate lunar or ſolar days, like tertian agues; and that at other times they obſerve the monthly lunation, and ſeem to be induced by the debility which attends menſtruation. But all the caſes that we have ſeen have been quotidian.

In ſome inſtances, this hemicrania is obviouſly connected with dyſpepſia, or a diſordered ſtate of the digeſtive organs; in others it has occurred along with catarrh; and in others again it has been produced by fatigue, watching, intenſe ſtudy, or ſome other cauſe of debility. Dr. Darwin conſiders it as ſometimes occaſioned by a decaying tooth, eſpecially the dens ſapientiæ, or laſt tooth of the upper jaw, which frequently decays firſt. (See Zoonomia, claſs 4. 2. 2.) And he adds, that the firſt or ſecond grinder of the under-jaw is liable to give violent pain about the middle of the parietal bone, or ſide of the head, on the ſame ſide, which is generally called the *clavus hyſtericus*. It more commonly, we believe, produces the ear-ache.

This diſeaſe differs altogether from the *tic douloureux*, in the regularity of its diurnal periods and intermiſſions, and in the length of both. In the *tic*, "the pain comes on ſuddenly and is excruciating; it laſts but a ſhort time, perhaps a quarter or half a minute, and then goes off; it returns at irregular intervals, ſometimes in half an hour, ſometimes there are two or three repetitions in a few minutes." Dr. Fothergill, from whom theſe remarks are quoted, adds, that "eating will bring it on in ſome perſons; talking, or the leaſt motion of the face, affects others, &c." (See a paper on "a painful affection of the face," in the Med. Obſ. and Inquiries, vol. v. page 131.) In theſe points the two diſorders are perfectly diſtinct; not to mention the obſtinacy and permanency of the *tic douleureux*, and the general facility of curing the *megrim*, or intermittent hemicrania.

In the treatment of this diſeaſe, the bark of cinchona has ſuggeſted itſelf by the analogy of the intermiſſions with thoſe of ague, to moſt practitioners, and is perhaps often adequate to the cure of the periodic hemicrania. Morton affirms, that he had cured the diſorder in two days by means of the bark, although it had reſiſted bliſters, emetics, catharties, and other remedies for ſeveral weeks; he uſed one bleeding previouſly. (See his Phthiſiologia, ex. 1. cap. 9.) Darwin recommends the cinchona in combination with opium, after an evacuation by purging, or ſlight blood-letting. A remedy was propoſed by Mr. Davidſon, which we have ſometimes found to ſucceed in preventing the acceſſion, and in curing the diſeaſe; namely, a large doſe of æther taken at the very commencement, or immediately previous to the expected paroxyſm. (See Medical Facts and Obſervations, vol. v.) But the moſt decidedly active remedy, according to our obſervation, is the one recommended by the late Dr. Fowler of York; *viz.* four or five drops of the ſolution of arſenic, prepared according to that phyſician's formula, taken twice or three times a day. The efficacy of this remedy has appeared to be ſuch, as almoſt to entitle it to the appellation of a *ſpecific* againſt this diſeaſe. The ſevere meaſure of dividing the affected nerve, as it paſſes through the foramen, has been recommended and occaſionally executed, we believe, with precarious ſucceſs; but the expedients above-mentioned ſuperſede the neceſſity of the knife. We have not ſeen the *megrim* affecting the ſecond, or infra-orbital branch of the fifth pair of nerves, which is occaſionally the ſeat of *tic douleureux*. See Tic *Douleureux*.

HEMICYCLE, Hemicyclium, compounded of ἡμισυς, *half*, and κυκλος, *circle*, a *ſemicircle*.

Hemicycle is particularly applied, in *Architecture*, to vaults in the cradle form; and arches, or ſweeps, of vaults, conſtituting a perfect ſemircircle.

To conſtruct an arch of hewn ſtone, they divide the hemicycle into ſo many vouſſoirs; taking care to make them an uneven number, that there be no joint in the middle, where the key-ſtone ſhould be. See Key and Bridge.

Hemicyclium was alſo a part of the orcheſtra in the ancient theatre. Scaliger, however, obſerves, it was no ſtanding part of the orcheſtra; being only uſed in dramatic pieces, where ſome perſon was ſuppoſed to be arrived from ſea, as in Plautus's Rudens.

The ancients had alſo a ſort of ſun-dial, called *hemicyclium*. It was a concave ſemicircle, the upper end, or cuſp, whereof looked to the north.

There was a ſtyle, or gnomon, iſſuing from the middle of the hemicycle, whereof that point, correſponding to the centre of the hemicycle, repreſented the centre of the earth; and its ſhadow projected on the concavity of the hemicycle, which repreſented the ſpace between one tropic and another, the ſun's declination, the day of the month, hour of the day, &c.

HEMIDESMUS, in *Botany*, from ἡμισυς, *half*, and δεσμος, *a tie* or *attachment*, on account of the filaments being united in their lower part, though ſeparate in the upper. Brown. Aſclep. from the Tranſactions of the Wernerian Society at Edinburgh, 45.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Juſſ.

Eſſ. Ch. Corolla wheel-ſhaped, with five obtuſe ſcales at its ſinuſes. Filaments united at the baſe, ſeparate above. Anthers cohering, beardleſs, ſimple at the ſummit, unconnected with the ſtigma. Maſſes of pollen 20. Stigma pointleſs. Follicles cylindrical, widely ſpreading, ſmooth. Seeds crowned with hair.

This genus, ſeparated by Mr. Brown from *Periploca*, to which it is very nearly akin, conſiſts of *P. indica* of Linnæus, and two other ſpecies hitherto undeſcribed, cloſely related to each other. They are ſmooth twining *ſhrubs*, with oppoſite ſhining *leaves* and ſmall *flowers*, which ſpring in denſe tufts from between the footſtalks; all natives of the Eaſt Indies.

HEMIDIAPENTE, in *Muſic*, ſemi-diapente or falſe, flat, or imperfect fifth, is an interval whoſe ratio is $\frac{4}{6}\frac{4}{4} = 311\,\Sigma + 6f + 27m$. See *Flat* Fifth.

HEMI-

HEMIDITONE, ſemiditone, or demiditone, ſeſquitone, trihemitone, minor tierce, or leſſer or minor third, is an interval whoſe ratio is $\frac{5}{6} = 161\,\Sigma + 3f + 14\,m$. See *Minor* THIRD.

HEMIGENIA, in *Botany*, from ἡμισυς, *half*, and γενειας, *hairineſs* or *beard*, from the peculiar pubeſcence of two out of the four anthers. Brown. Prodr. Nov. Holl. v. 1. 502.—Claſs and order, *Didynamia Gymnoſpermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Eſſ. Ch. Calyx with five ſegments, and five angles. Corolla ringent; its upper lip ſhort; middle ſegment of the lower one divided half way down. Stamens aſcending under the upper lip. Anthers each with one empty deſcending lobe, which in the upper pair only is bearded.

1. H. *purpurea*. Native of Port Jackſon, New South Wales. A little ſmooth *ſhrub*. *Leaves* ternate, nearly cylindrical. *Flowers* blueiſh-purple, axillary, ſolitary, with a pair of *bracteas* to each. *Brown*.

HEMIMERIS, from ἡμισυς, *half*, and μερις, *a part* or *fragment*, alluding to the corolla being, as it were, cut away on one ſide, and eſpecially wanting the ſpur obſervable in *Antirrhinum*, from which the plants which compoſe the genus of *Hemimeris* were originally ſeparated by Linnæus, on that very account. This however is not explained by him, nor ſcarcely to be gathered from his deſcription; and therefore profeſſor Martyn has left the word unexplained.—Linn. Pl. Rar. Afric. 8. Suppl. 45. Thunb. Nov. Gen. 74. Schreb. 409. Willd. Sp. Pl. v. 3. 282. Sm. Tr. of Linn. Soc. v. 6. 96. Mart. Mill. Dict. v. 2. Juſſ. 120. Lamarck. Illuſtr. t. 532. (Pæderota; Am. Acad. v. 6. 83. Linn. Gen. 12, excluding Micheli's ſynonym.)—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Scrophulariæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, divided almoſt to the baſe into five unequal, ovate, permanent ſegments, much ſhorter than the corolla. *Cor.* of one petal, reverſed, ſomewhat wheel-ſhaped, without any tube, in five very unequal rounded lobes, with a nectariferous ſhallow pouch at their baſe; the largeſt lobe uppermoſt; the two ſmalleſt lowermoſt, ſeparate to the very bottom. *Stam.* Filaments four, ſometimes only two, ſhorter than the corolla, inſerted into its baſe, declining, ſmooth, the upper pair arched and rather the ſhorteſt; anthers heart-ſhaped, approximated, of two valves. *Piſt.* Germen ſuperior, ovate, compreſſed; ſtyle declining, thread-ſhaped, longer than the ſtamens; ſtigma obtuſe, downy. *Peric.* Capſule ovate, compreſſed, of two cells, one generally more tumid than the other. *Seeds* numerous, roundiſh.

Eſſ. Ch. Calyx in five deep ſegments. Corolla wheel-ſhaped, reverſed, gibbous at the baſe, divided on one ſide. Filaments ſmooth. Capſule of two cells.

Obſ. Linnæus having firſt eſtabliſhed this genus, by the above name, from a Cape ſpecimen lent him by Burmann, afterwards confounded with it the *Buonarotta* of Micheli, under the appellation of *Pæderota*. But the plants on which Micheli founded his genus, ſtrictly agree with the *Wulfenia* of Jacquin, to which they are referred in the Tranſactions of the Linn. Soc. v. 6. 96, the latter name being, on every poſſible account, preferred to *Pæderota*, which now therefore is laid aſide, *Hemimeris* having no leſs decided a right to claim a preference on the other hand, for the genus which originally bore it. With regard to the ſpecies of this genus, profeſſor Willdenow and the author of the preſent article, labouring independent of each other, have come, as nearly as poſſible, to the ſame concluſion.

1. H. *fabuloſa*. Linn. Suppl. 280. Thunb. Prodr. 105.—Stamens two. Leaves oppoſite, pinnatifid. Stem proſtrate. Calyx acute, fringed.—Native of the Cape of Good Hope, gathered by Thunberg, from whom there are many fine ſpecimens in the Linnæan herbarium. The *root* is annual, compoſed of numerous long fibres. *Stem* two or three inches high, more or leſs branched in an oppoſite manner from the very bottom, ſmooth, leafy. *Leaves* oppoſite, ſtalked, ſmooth, not an inch long, regularly and deeply pinnatifid; the ſegments obtuſe and entire. *Flower-ſtalks* axillary, ſolitary, twice as long as the leaves, ſimple, naked, ſmooth, ſingle-flowered. *Flowers* about the ſize of *Anagallis arvenſis*, yellow or purpliſh.

2. H. *diffuſa*. Linn. Suppl. 280. Thunb. Prodr. 105. (Pæderota Bonæ ſpei; Linn. Sp. Pl. 20.)—Stamens four. Leaves alternate or oppoſite, pinnatifid. Stem ſpreading. Calyx acute, fringed. Native of the Cape of Good Hope. This has the habit of the former, of which the younger Linnæus ſuſpected it might be a variety, but to this we cannot aſſent. The preſent is in every part a much larger plant. The *leaves* vary conſiderably in the depth of their ſegments, which are ſometimes notched. The *corolla* is purple. The *filaments* are four, approaching each other at the top, their *anthers* ſlightly cohering. Plukenet's t. 320. f. 5. is quoted for this, but can only ſerve to miſlead, if it be intended for the ſame, which we can ſcarcely believe. We can hardly doubt that the original *Hemimeris* (afterwards called *Pæderota*,) *bonæ ſpei* is this ſpecies, though it was at firſt deſcribed as diandrous.

3. H. *unilabiata*. Thunb. Prodr. 105. Nov. Gen. 78. (Antirrhinum unilabiatum; Linn. Suppl. 279. Willd. Sp. Pl. v. 3. 259.)—Stamens four. Leaves oppoſite, pinnatifid. Calyx obtuſe, hairy.—Native of ſandy ground at the Cape, flowering in October. *Root* tapering, annual. *Stem* with long ſpreading branches from its very baſe. *Leaves* an inch long, ſtalked, oppoſite, pinnatifid, their ſegments alternate, linear, obtuſe, entire. *Flower-ſtalks* about half an inch long, alternate, ſimple, rather hairy, with a linear, obtuſe, ſmooth *bractea*, not ſo long as itſelf, at the baſe of each. Segments of the *calyx* lanceolate, obtuſe, hairy, a line long, much ſhorter than the corolla, ſpreading, the two hindermoſt reflexed. *Corolla* crimſon, violet at the lower part, the nectariferous pouch at its baſe lengthened out into two yellowiſh horns, ſhorter than the calyx. *Filaments* four, their *anthers* hairy at the ſummit. *Capſule* ovate, ſquariſh, compreſſed and emarginate at the top.—We know nothing of this but from Thunberg's ample deſcription, from which we have extracted the above. It is remarkable that, in this and other ſpecies, he deſcribes the capſule as "*crowned* with the permanent calyx and ſtyle," a thing truly paradoxical in a genus, whoſe calyx is inferior!

4. H. *ſinuata*.—Stamens .... Leaves oppoſite, oblong, ſinuated, ſomewhat pinnatifid. Calyx obtuſe, ſmooth.—Gathered by Sparrmann at the Cape of Good Hope. The younger Linnæus confounded his ſpecimens with *H. diffuſa*, from which they are unqueſtionably different. The *leaves* are ſinuated at their edges, not deeply pinnatifid. The *corolla* is externally hairy. Of the *ſtamens* we can determine nothing. The *calyx* however removes every difficulty, being totally unlike that of all the foregoing, neither hairy nor fringed; its ſegments are elliptical and obtuſe, all ſlightly ſpreading, none of them reflexed. The *capſule* is ſcarcely more gibbous on one ſide than the other.

5. H. *montana*. Linn. Suppl. 280. Thunb. Prodr. 105.—Stamens two. Leaves ovate, bluntiſh, ſerrated. Stem erect. Flower-ſtalks compreſſed.—Native of the Cape. Differs from the four preceding in having broad, ovate, many-ribbed, ſerrated *leaves*, ſometimes ſlightly hairy; and compreſſed *flower-ſtalks*. The *calyx* is reflexed and acute.

Corolla large, yellow, externally downy. Plukenet's t. 331. f. 3. is too unlike this plant in the flowers to merit citation.

6. H. *macrophylla*. Thunb. Prodr. 105. Nov. Gen. 76.—Stamens four. Leaves oppofite, ovate, fomewhat heart-fhaped, toothed. Flower-ftalks capillary.—Gathered by Thunberg at the Cape, between Bockland and Hantum, near the fhore. By his defcription, which is all we know concerning this fpecies, it feems moft akin to the laft, but differing in the characters given above, as well as in the violet colour of its *corolla*.

7. H. *urticifolia*. (Celfia urticæfolia; Curt. Mag. t. 417.)—Stamens four. Leaves ovate, or fomewhat lanceolate, ferrated; the floral ones alternate. Capfule abrupt.—Brought by Mr. A. Menzies from Peru. It flowered beautifully at Kew in May 1797, and is now common in every greenhoufe and parlour window. We have had the feeds remain latent for feven years in a garden, and then fpringing up in the autumn, they have produced fine flowering plants by the end of February, in a room with a fire. The *ftem* is from three to five feet high, branched, leafy, fquare, fcarcely fhrubby, though exifting for three or four years with care in a ftove. *Leaves* oppofite, ftalked, much refembling *Urtica urens*, but fmooth and fhining, fœtid when bruifed. *Flowers* ftalked, axillary, from the upper and fmaller leaves, of a moft vivid fcarlet, greenifh and purplifh at the bottom, with yellow anthers. The *filamens* are fometimes five. *Capfule* compreffed and abrupt at the extremity, not taper-pointed, by which it is eflentially diftinguifhed from the following, though their leaves, however different in general, fometimes nearly approach each other.

8. H. *linearis*. Sm. Tr. of Linn. Soc. v. 6. 97. Tour on the Continent, ed. 2. v. 3. 209. (H. coccinea; Willd. Sp. Pl. v. 3. 283. Celfia linearis; Jacq. Coll. v. 2. 250. Ic. Rar. t. 497. Curt. Mag. t. 218.)—Stamens four. Leaves linear-lanceolate, fomewhat ferrated, three in a whorl; the floral ones alternate, entire. Capfule pointed.—Brought from Lima by the unfortunate Dombey, though "the illuftrious Ortega" made no mention of him when he fent the feeds to Jacquin. We law it in flower at Paris in 1786, and it was foon after brought from thence to England. This feems more tender than the laft, being now far lefs common here. Their *flowers* nearly agree. The *leaves* of the prefent grow three together, and are commonly very narrow and acute, but we have gathered them almoft as broad as in the laft; while, on the other hand, we have often feen, in old plants, the leaves of that as narrow as in this. The *capfule* however of *H. linearis* proves it a very diftinct fpecies, being elongated into an acute point, by no means abrupt or compreffed. The *ftem* of the *corolla* has alfo rather more of the reddifh caft, and the ftem is a little more ftraddling, with axillary tufts of copious little linear leaves.

The error of *Ortega*, in taking this for a *Celfia*, having been adopted blindly by Jacquin, and far too forcibly, though not blindly, by Curtis, has caufed the wide propagation of a wrong generic name for thefe two very popular plants. Such miftakes are difficult to remove, and thofe who correct them run the rifque of being blamed for changing names among the vulgar; a cenfure only deferved by fuch as alter names only, not thought paffably for the better, without furnifhing any new information in that refpect, or leading to any new truth. Of fuch alterations there is no end, either with refpect to their difficulty or their multitude, and we hope there is no danger of their being encouraged, either by the learned or the unlearned. S.

HEMIMEROPTERA, in *Entomology*, an order of infects in the new arrangement of Clairville, author of "Entomologia Helvetica," exactly corresponding with the Hemiptera of other entomologifts. See HEMIPTERA.

HEMINA, formed of ἡμισυ, *half*, a veffel ufed as a meafure among the ancient Romans, containing half the *fextary*. The hemina, called alfo *cotyla*, and *acetabulum*, contained eight ounces of liquor; and was the twelfth part of the congius.

Several authors have written expreſs treatifes on the Roman hemina; particularly Meſſ. Arnaud, and Pelletier.

St. Benedict prefcribes the hemina as the portion or quantity of wine to be allowed the religious of his order at each meal. F. Mabillon, who has wrote on the fubject, fhews, that this hemina was a meafure peculiar to the Benedictines, as well as the pound of bread allowed the fame religious, which only conſiſted of fifteen ounces. F. Lancelot has a diſſertation to prove, that the hemina of wine, prefcribed by St. Benedict, only amounts to a demi-feptier of Paris meaſure; but others make it two feptiers; and others three.

HEMIOBOLON, a weight often mentioned by the ancient writers in medicine, and expreſſing the half of their obolus, or the twelfth part of a dram, that is, five grains.

HEMIOLIUS, or HEMIOLIA, compounded of ἡμισυ, *half*, and ὅλος, *whole*, an ancient mathematical term, occurring chiefly in muſical writers. It ſignifies the ratio of two things, of which the one contains the other once and a half; as 3 : 2, or 15 : 10, otherwiſe called *ſeſquialtera*. See RATIO, and SESQUIALTERATE.

Macrobius, on the Somnium Scipionis, lib. ii. cap. 1. obſerves, that the concord, called in the ancient muſic *diapente*, and in the modern a *fifth*, ariſes from this proportion.

HEMIONITIS, in *Botany*, from ἡμιονος, *a mule*, becauſe it was ſuppoſed to be barren. Male Fern.—The *ſpecies* of Dioſcorides appears, by his deſcription, to be *Aſplenium Hemionitis* of Linnæus, as has always been ſuppoſed. The name in queſtion is therefore adopted to deſignate another genus of *Coriaceous* Ferns, bearing ſome reſembling the ancient plant in habit, and next akin to it, though diſtinct, in fructification.—Linn. Gen. 560. Schreb. 757. Swartz. Syn. Fil. 20. Sprengl. Crypt. 92. t. 3. f. 19. Juſſ. 15. Lamarck. Illuſtr. t. 818.—Claſs and order, *Cryptogamia Filices*. Nat. Ord. *Filices*, Linn. *Juſſ.*

Gen. Ch. *Capſules* annulated, in diſperſed fingle lines, which are either reticulated, forked, or croſſing each other alternately. *Involucrum* none.

Eſſ. Ch. Fructification in ſcattered ſingle lines, croſſing each other, forked, or reticulated. Involucrum none.

Obſ. We have already, under the article DITAXIS, explained the reaſon of that genus being ſeparated from the preſent, with which it had been confounded by Smith and Cavanilles, as it formerly had with *Aſplenium* by Linnæus and Swartz. The latter writer now defines eight ſpecies of *Hemionitis*, which include what Linnæus originally founded the genus upon, and therefore this name properly belongs to them.—They divide themſelves into two ſections, and we add two new ſpecies to each ſection.

* *Frond Simple.*

1. H. *lanceolata*. Linn. Sp. Pl. 1535. Lamarck. t. 818. (Lingua cervina anguſtifolia et reticulata; Plum. Fil. 111. t. 127. f. C. Phyllitis anguſtifolia, lanceolata; Pet. Fil. n. 122. t. 6. f. 4.)—Frond undivided, lance-lanceolate, ſtraight, tapering at the bafe, with ſcarcely any Rib.—Native of the Weſt Indies.—*Root* of numerous fibres, creſted

clothed with peculiarly long and denfe down, of a golden brown colour. Plumier repreſents it as if creeping, without any ſuch downy fibres. *Fronds* ſeveral, about a foot high, linear-lanceolate, pointed, half an inch wide, entire, ſlightly wavy, ſmooth and naked on both ſides, their baſe gradually contracted, but ſcarcely ſtalked. *Midrib* prominent beneath. Lines of *fructification* about two on each ſide of the rib, longitudinal, very narrow, naked, zigzag, meeting frequently and interbranching, as if croſſing each other, but by no means in that regular ſerpentine or chain-like manner, drawn by Plumier, and, at leaſt, not made *leſs* wonderful by his copies.

2. H. *reticulata*. Forſt. Prodr. 79. Swartz. Syn. Fil. 208. Sprengel. t. 3. f 19, as above. (H. plantaginea; Cavan. Lection. 261. Schkuhr. Crypt. t. 6; according to Swartz.)—Frond undivided, elliptic-lanceolate, ſomewhat falcate, ribleſs, tapering at the baſe, ſcarcely ſtalked. —Native of the Society iſlands, and of the Philippine iſles. Mr Menzies gave us a ſpecimen from Otaheite. This is diſtinguiſhed from the firſt by its much broader and falcate frond, which is pointed and ſlightly waved; but eſpecially by its very numerous lines of *fructification*, which are repeatedly forked, though often interrupted, more ſtraight and parallel, ſcarcely zigzag or interbranching. They are very narrow, and ſlightly ſink into the back of the leaf. There is no appearance of a mid-rib, except at the very bottom.

3. H. *ſtipitata*. Frond undivided, elliptical, ribleſs, the length of its ſtalk. Fructification in deep channels.—Sent from Amboyna by the late Mr Chriſtopher Smith.—*Frond* the length and breadth of the laſt, being about two inches wide and ſix long, but ſcarcely falcate; the baſe is broad, and not much decurrent, with a ſlight ſhort rib, ſcarcely diſcernible, in that part only. The *ſtalk* is equal in length to the frond or leaf, linear, ſquare, ſmooth, and naked. Lines of *fructification* diſpoſed as in the laſt, but thoſe towards the margin are rather more zigzag; all are deeply ſunk into the leaf, cauſing the upper ſide to project remarkably, in a beautiful ſort of net-work.

4. H. *ſeſſilifolia*. Cavan. Lection. 261. Swartz. n. 3. —Frond lanceolate, ſeſſile, with a long ſlender point.—Native of wet rocks in the iſland of Mauban. *Frond* ſix or eight inches long, and one broad, entire and ſmooth, with a long ſharp point. "The lines form a kind of oblong hexagonal net-work." *Cavanilles*. Of this we have ſeen neither ſpecimen nor figure.

5. H. *palmata*. Linn. Sp. Pl 1535. Lamarck. f. 2. (H. aurea hirſuta; *Plum. Fil.* 129. t. 151. Filix ranunculi folio, prolifera; Pet. Fil. n. 177. t. 8. f. 11.—Plok. Phyt. t. 291. f 4.)—Frond palmate, hairy, pentagonal; the lobes undivided, wavy and crenate.—Native of the Weſt Indies. *Root* of many long, branching, ſcarcely hairy fibres. *Stalks* ſeveral, from three to ten inches high, ſimple, ſtraw brown, hairy. *Fronds* the ſhape of a pentagon, 1½ inch or more in diameter, deeply palmate, of five lobes, the middle one longeſt, two lowermoſt ſmalleſt, all wavy or crenate, with a ſhining brown rib to each, and clothed with ruſty, or rather golden, hairs. Theſe partly conceal the lines of *capſules*, which are prominent, crowded, and moſtly parallel.

6. H. *pedatifida*.—Frond peltated, hairy, pentagonal, the lobes bluntly pinnatifid, rounded at the extremity.—Native of the iſle of Bourbon.—This has much the ſhape of *Filix pedata*, but is manifeſtly too near akin to the laſt to leave any doubt of its genus, though we have not ſeen the fructification. The two ſpecies agree in hue, outline, and colour, but the diviſion of their fronds is eſſentially different. The three upper lobes of this are deeply pinnatifid, partly bipinnatifid, their ſegments and extremities rounded, and in ſome meaſure dilated; the two loweſt and ſmalleſt, which complete the pentagon, are pendulous, or parallel to the ſtalk, pinnatifid alſo, though ſlightly. Each lobe has a dark-purpliſh ſhining rib, vaniſhing about its middle.

** *Frond Compound.*

7. H. *pedata*. Swartz. Syn. Fil. 20 and 209. t 1. f. 3. —Frond pedate; leaflets deeply pinnatifid, acute.—Sent to Dr. Swartz by the late worthy Abbé Cavanilles, but without mention of its native country. *Stalk* half a foot high, poliſhed and ſmooth. *Frond* hairy, of three leaflets; the central one ſmall, bluntly pinnatifid, and obſcurely three-lobed; the lateral ones each two or three inches long, very deeply and rather unequally pinnatifid, the lobes pointed, deeply pinnatifid, with thorpiſh ſomewhat falcate ſegments. Lines of *capſules* numerous, ſtraight, parallel, ſome of them inoſculating.

8. H. *rufa*. Swartz. Syn. Fil. 20 and 210. (Acroſtichum rufum; Linn. Sp. Pl. 1525. Filix minor, ruffa longiore tota obſcura, &c. Sloane Jam. v. 1. 87. t. 45. f. 1.)—Frond pinnate; leaflets oblong, heart-ſhaped at the baſe, undivided, downy, on ſhort ſtalks.—Native of ſhady places on the mountains of Jamaica. *Stalks* ſeveral, ſimple, about as thick as a ſtraw, a foot long, round, blackiſh, hairy. *Frond* with a ſimilar main rib, two feet long, pinnate, narrow or linear taken collectively, acute. *Leaflets* numerous but rather diſtant, oppoſite or alternate, ſpreading, an inch or more in length, on ſhort hairy ſtalks, oblong, rather tapering, heart-ſhaped at the baſe, undivided, but ſomewhat wavy or crenate, very hairy on both ſides, all nearly equal and ſimilar in every reſpect, except the terminal one being rather the largeſt. Lines of *capſules* covering the under ſide, of a pale reddiſh ruſty hue, parallel, ſomewhat forked, very much crowded, ſo as at length to aſſume the character of an *Aſpidium*, at leaſt in appearance; and they are likewiſe interſpersed with numerous hairs.

9. H. *trifida*.—Frond pinnate; leaflets three-lobed, lanceolated, taper-pointed, downy, ſtalked; the lowermoſt ternate.—Communicated from the Braſils by the late Sir Geo. Leonard Staunton bart. in 1793. It is evidently akin to the laſt, of which it might perhaps be deemed a variety, but the whole *frond* is ſhorter, though the leaflets are larger; they are alſo both hairy and more finely downy, more waved and often lanceolated, taper-pointed, three-lobed, ſometimes very deeply, at their baſe; their ſtalked ſtalks much longer, and the lowermoſt pair compound or ternate, at leaſt occaſionally ſo. The terminal leaflet is large, very deeply three-lobed. All are of a fine light green. Lines of *capſules* numerous, but much leſs crowded, and much more repeatedly forked. This is a moſt elegant fern, of which we can find no account. It can ſcarcely be the *Aſplenium tenuifolium*, Lamarck. Dict. n. 2. 326, found in Brazil by Commerſon and Dombey, which Swartz quotes for the foregoing, and the deſcription of which but agrees with that ſpecies.

10. H. *amplifolia*. Swartz n. [illegible] Frond pinnate, diſtinct; leaflets lanceolate-oblong, taper-pointed, waved or crenate. Fructification [illegible].—Gathered at Sierra Leone by Dr. Afzelius.

11. H. *polyphylla*.—Frond pinnate, diſtinct; leaflets ſeſſile, oblong, pointed, pinnatifid; their lobes ſharp, entire.—Gathered in Hiſpaniola by the celebrated M. Thiery de Menonville. We find nothing like it in Plumier. The *frond* is about the ſize of *Aſplenium Trichomanes*, and the innumerable, fine, diverging lines of capſules give it the aſpect

aſpect of a true *Polypodium*. The *leaflets* are leſs deeply pinnatifid than in A. *Oreopteris*, but otherwiſe not very unlike that fern. They are ſmooth, though their ſtalk and ribs are finely ſilky.

12. *H. japonica*. Thunb. Jap. 333. Ic. faſc. 6.—"Frond doubly pinnate; leaflets lanceolate, undivided."—Gathered in Japan by Thunberg. The whole *frond* is deſcribed by him as ſmooth, with a furrowed ſtalk; the lower part doubly, the upper ſimply, pinnate; leaflets lanceolate, acute, undivided, green above, pale beneath. The *fructification* is in three-forked lines, over all the under ſide. S.

HEMIOPE, or HEMIOPUS, compounded of ἡμισυς, *half*, and ὀπη, *hole*, a muſical inſtrument in uſe among the ancients.

The hemiopus was a flute with only three ſmall holes.

HEMIOPIA ſignifies, in *Surgery*, a certain diſorder of the eye in which the patient cannot ſee the whole of any object which he is looking at, but only a part of it. Sometimes he ſees the middle, but not the circumference; ſometimes the circumference, but not the centre; while, on other occaſions, it is only the upper or lower half which is diſcerned. Sometimes objects are ſeen thus imperfectly, whether diſtant or near; ſometimes only when they are near, and not when they are at a diſtance.

The cauſes of this defect of ſight may be divided into four principal claſſes. To the firſt belong opacities of the cornea and cryſtalline lens, eſpecially ſuch as only deſtroy the tranſparency of a certain portion of theſe parts. Patients who have theſe opacities only ſee in the above imperfect way when the objects are cloſe, and not when they are remote. For inſtance, if the lower half of the cryſtalline lens, or cornea, is opaque, the patient cannot ſee the lower half of the object which is near him, becauſe it is impoſſible for the rays of light from this part to reach the bottom of the eye; hence he only ſees the upper part of the object. However, this ſtatement only applies to things of large ſize, and not to ſuch as are ſmall; as, for inſtance, letters, ſmall pieces of money, &c.; but when the object is diſtant, the rays of light, both from its upper and lower part, ſtrike the retina, and the patient ſees the whole of it. Indeed, when he turns his eye very much downward, he is even able to ſee the whole of a near object. It is on this account that patients of this deſcription readily get into a habit of ſquinting. The diagnoſis of this caſe is plain and obvious, and the requiſite treatment is elſewhere explained. See CATARACT; *Opacities of the Cornea*.

Under certain circumſtances, perſons with an incomplete anchyloblepharon, or thoſe, whoſe upper eye-lid hangs down, ſo as to cover a part of the eye-ball, are affected with hemiopia. For example, they can naturally only diſcern the lower half of an object which is near and of large ſize, unleſs they go farther from it, draw their heads backward, or turn their eyes downward. On certain occaſions, the pupil becomes drawn away from the middle of the iris downwards, or ſideways to the margin of the cornea. This unnatural poſition of the pupil is alſo, under particular circumſtances, accompanied with hemiopia. For inſtance, when the pupil is drawn downwards it is impoſſible for the patient to ſee the upper part of a large cloſe object, unleſs he either turns his eye very much upward, or removes to a greater diſtance from what he is looking at. The nature of this caſe is obvious; but a cure is impracticable.

It is the ſame when, from ſome cauſe or another, commonly from external violence applied to the eye, any part of the iris is ſeparated from the edge of the cornea. In this caſe the natural pupil uſually cloſes, and a ſemi-lunar opening ariſes in the ſituation where the detachment has happened. Through this aperture, which is always next to the edge of the cornea, the patient naturally cannot diſcern the lower part of a near object, ſuppoſing the opening to be at the upper margin of the cornea. However, if he removes further from the object, or turns his eye very much downward, he is then able to ſee the whole of it. The diagnoſis of this caſe is alſo eaſy, though no cure can be effected.

The ſpecies of hemiopia, hitherto treated of, are merely effects of other diſeaſes. The fourth kind is the moſt important, being generally regarded as an independent diſorder. It is of two ſorts, being ſometimes denominated amauroſis dimidiata, which is a caſe that laſts a conſiderable time. Sometimes it appears rather to be the effect of a ſudden and tranſient irritation, which is productive of a morbid ſenſibility in the optic nerve. This latter caſe bears a cloſe reſemblance to one kind of diplopia, proceeding from the ſame cauſes, and requiring the ſame mode of treatment. The cauſes, according to Richter, are for the moſt part ſeated in the abdominal viſcera. With regard to the firſt kind of caſe, every thing ſaid concerning *gutta ſerena* is here applicable, the diſorder indeed frequently terminating in amauroſis. Richter informs us of a man, who, in performing a journey on horſeback, in rainy weather, was wet through and through, and had no opportunity of changing his clothes for ſome hours; the conſequence was, that the next morning he found he was only able to ſee the half of objects, which ſeemed to have a ſwinging ſort of motion. After a gentle evacuation from the bowels, the complaint was cured in three days by the tinctura thebaica mixed with antimonial wine, bliſters, and the aqua ammoniæ puræ held before the eyes. In leſs than three weeks the complaint returned twice, in conſequence of ſlight colds; but the patient at length got permanently rid of it after diligently bathing his eyes, for a time, with cold water. See Richter's Anfangſgrunde der Wandarzneykunſt, Band 3. Kapitel 17.

HEMIPLEGIA, or HEMIPLEXIA, compounded of ἡμισυς, *half*; and πλησσω, *I ſtrike*, or *ſeize*, in *Medicine*, a palſy of one whole ſide of the body. See PALSY, and *Medical* ELECTRICITY.

HEMIPTERA, in *Entomology*, the ſecond order in the Linnæan ſyſtem.

The character of the genus is taken from the ſituation of the mouth, and the ſhape, texture, and poſition of the wing-caſes; the mouth is bent in towards the breaſt; and the wing-caſes are ſoft, ſemi-coriaceous, and diſpoſed obliquely, the baſe of the left covering the inner margin of the baſe of the right in ſuch a manner that the poſterior half of one is overlaid by the correſponding extremity of the other. Linnæus under this order includes the following genera, Blatta, Mantis, Gryllus, Fulgora, Cicada, Notonecta, Nepa, Cimex, Aphis, Chermes, Coccus, and Thrips.

In the works of Geoffroy, the inſects placed by Linnæus in the order Hemiptera, form only a diviſion of the Coleoptera, from which they are diſtinctly removed by the ſofter and more membranaceous texture of the wing-caſes, and yet more clearly by the oblique poſition of the future, the two inner edges of the wing-caſes in the coleoptera touching each other at the margin, and forming a longitudinal dorſal line.

The inſtitution of the new order Hemiptera was therefore an improvement in the claſſification of inſects upon the arrangement propoſed by Geoffroy, becauſe it finally ſeparated thoſe two diſtinct orders from each other. But Linnæus ſtill left much to be accompliſhed by his ſucceſſors. In the firſt place, for example, the term *hemiptera*, which he derives from ἡμισυ, *half*, and πτερὸν, *a wing*, is applicable only to ſome of the genera. It well accords with the hemelytrous upper wings, or wing-caſes of the Cimices, and as evidently diſ-

agrees

agrees with thoſe of the Grylli and Fulgoræ, which are of an uniformly coriaceous texture throughout. Let us further attend to the poſition of theſe wing-caſes when the inſect is at reſt, and the conſequent form and direction of the dorſal ſuture, and in this we again perceive a manifeſt diſtinction; in the Cimices, the Nepæ, and Notonectæ, the extreme half of one folds acroſs the extreme half of the other, and the ſuture (conſidered throughout) is curved obliquely: in the genera Gryllus, Fulgora, and Cicada it is ſtraight, and as diſtinctly forms a longitudinal dorſal line as in the inſects of the Coleoptera order. The form of the wings, their length and ſituation, when folded up beneath the elytra, afford another very obvious diſtinction, and many others might be ſhewn; but there is no character perhaps throughout, in which a difference is more fully manifeſted than the ſtructure of the mouth affords. Linnæus, in deſcribing this eſſential organ, merely tells us the mouth is bent down towards the breaſt, an expreſſion ſo fugitive and unmeaning, that it cannot fail to create ſome ſentiment of ſurpriſe in the minds of thoſe who have the means of comparing the mouth of the Gryllus with the Cimex, the Blatta with the Nepa, or the Mantis with the Fulgora, Cicada, Notonecta, Coccus, and Chermes. Let him beſtow only a ſlight reflection on the diſſimilarity of theſe tribes in this individual reſpect, and he will need no further teſtimony to convince him that a new arrangement is indiſpenſible. The mouth of the Gryllus, Blatta, and Mantis, are furniſhed with genuine jaws, or mandibles, adapted to the purpoſe of cutting their food (like other inſects laterally), and theſe jaws are covered by an obtuſe ſhield. On the contrary, the mouth in the Cimex, Nepa, Notonecta, Fulgora, Cicada, Coccus, and Chermes, conſiſts literally of an articulated tube or ſucker, which is either inflected or arched, and bent underneath the head, and is in general of pretty conſiderable length. The very form of this ſucker determines the office it is appointed by nature to fulfil, and ſhews that its owner is not deſtined to prepare its food by cutting. It muſt penetrate the ſubſtances and ſuck its juices; and this is truly the caſe, for the latter prey in this manner on the blood of animals as well as vegetable fluids. The puncture and mode of feeding in that noiſome inſect, the bed bug (Cimex lectuarius), is ſufficiently explanatory of this peculiarity.

It is not a little ſingular that the difference in the ſtructure of the mouth of theſe two natural tribes eſcaped the obſervation of every naturaliſt till they were diſcovered and pointed out by Fabricius. That writer was ſo fully ſatisfied with the permanent diſtinctions theſe afford, that upon this diſſimilarity alone he entirely divided the Linnæan hemiptera into two principal ſections, the firſt his *ulonata* and the other *cryngota*. The genera of the order *ulonata* in the Linnæan language (for Fabricius has divided them into a far greater number of genera than Linnæus) are gryllus, blatta, mantis, and forficula; the laſt being removed from the coleopterous order, in which Linnæus places it. The Fabrician order ryngota contains fulgora, cicada, cimex, nepa, notonecta, aphis, thrips, coccus, and chermes.

Olivier was the firſt who endeavoured to combine the advantages of the Fabrician improvements with an arrangement more nearly correſponding with that of Linnæus. With this view he divided the Linnæan hemiptera into two orders, allowing one to retain the Linnæan name, and aſſigning to the other that of orthoptera. This ſub-diviſion was adopted by Lamarck, and being ſtill continued by Latreille and other late writers, may be conſidered as in a great degree eſtabliſhed. The true hemiptera are thoſe which have the wing-caſes half-way down coriaceous, and in which the extremity of one wing-caſe folds over the other, and the mouth furniſhed with a ſheath or trunk by the introduction of which into the fleſh of animals and plants it derives its aliments. The wing-caſes of the orthoptera are cloſed longitudinally, or horizontally when the inſect is at reſt, meeting at the ſuture, but not folding at the tips one over the other; and the armament of the mouth conſiſts of two ſtrong mandibles, two jaws, an upper lip, and four feelers. There are other or ſecondary characters attached to each, which confirm the propriety of eſteeming the two orders diſtinct.

HEMISPHERE, Hemisphærium, compounded of ἡμισυς, *half*, and σφαιρα, *ſphere*, in *Geometry*, is one half of a globe, or ſphere, when divided into two by a plane paſſing through its centre.

If the diameter of a ſphere be equal to the diſtance of the two eyes; and a right line drawn from the centre of the ſphere to the middle of that diſtance be perpendicular to the line which joins the eyes; the eyes making a rotation on the axis, or middle point between them, will ſee the whole hemiſphere. If the diſtance of the eyes be either greater or leſſer than the diameter of the ſphere, in making ſuch rotation they will view reſpectively more or leſs than a hemiſphere. See Vision.

The centre of gravity of a hemiſphere is five-eighths of the radius diſtant from the vertex. See Center *of Gravity*.

Hemisphere, in *Aſtronomy*, is particularly uſed for one half of the mundane ſphere.

The equator divides the ſphere into two equal parts, called the *northern* and *ſouthern* hemiſpheres.

The northern hemiſphere is that half in whoſe vertex is the north pole. Such is that repreſented by D P A (*Plate* XVI. *Aſtronomy*, *fig.* 140.) terminated by the equator D A, and having the pole P in its zenith.

The ſouthern hemiſphere is that other half D Q A, terminated by the equator D A; and having the ſouth pole Q in its zenith.

The horizon alſo divides the ſphere into two hemiſpheres; the *upper* and the *lower*.

The upper hemiſphere is that alſo of the mundane ſphere H Z R, terminated by the horizon H R, and having the zenith Z in its vertex.

The lower hemiſphere is that other half H N R, terminated by the horizon H R, and having the nadir N in its vertex.

Hemisphere is alſo uſed for a map, or projection, of half the terreſtrial globe, or half the celeſtial ſphere, on a plane.

Hemiſpheres are frequently called *planiſpheres*.

HEMISPHEROIDAL, in *Geometry*, ſomething that approaches to the figure of a hemiſphere, but is not juſtly ſo.

HEMISSEN, John de, in *Biography*, a painter, who is not mentioned here becauſe of his extraordinary merit, but of extraordinary good fortune, in having moſt of his productions, particularly of children, attributed to a much more elevated genius, *viz.* Lionardo da Vinci; whence the miſtake ariſes, perhaps the dealers in pictures can beſt explain.

HEMISTICH, compounded of ἡμισυς, *half*, and στιχος, *verſe*, in *Poetry*, a half verſe. See Verse.

Such, *e. g.* are "Cernit Deus omnia vindex;"
or, "Medio tutiſſimus ibis, &c."

It is diſputed whether or no the hemiſtichs in the Æneid were left with deſign; or whether they are owing to the work's being unfiniſhed.

In Engliſh, &c. the common and Alexandrine verſes require

quire a reſt at the end of each hemiſtich; common verſes require it at the end of four ſyllables; and Alexandrine at the end of ſix.

Leonine verſes rhythm both at the end, and at the hemiſtich. See LEONINE.

HEMITONE, in *Muſic*, the ſame with ſemi-tone or half-tone, on ſome occaſions, but not always, as will appear from the following; *viz.*

HEMITONE of Ariſtoxenus or chromatic toniæum of this author, Euclid, Holder, &c. is half the major tone, and has a ratio of $2\sqrt{2} \div 3 = 52.00393\,\Sigma + f + 4m$ in the notation of J. Farey: its common logarithm being ·9744237·3877, its value in the logarithms of Euler or decimals of an octave = .084962, and it is equal to 4.74070 major commas: not belonging to the diatonic ſcale, which admits of no aliquot diviſions of intervals; it cannot therefore be tuned by any combination of perfect concords.

HEMITONE of Euclid's diatonum ſyntonum or intenſe, of his diatonum molle, and of his chroma toniæum, is an interval the $\frac{6}{36}$th or $\frac{1}{5}$th part of diateſſaron or minor fourth, $= 50.803145\,\Sigma + f + 4m$, or $50\frac{1}{5}\Sigma + f + 4\frac{2}{5}m$, whoſe common logarithm is .9750122.5268, the logarithm of Euler or decimal of an octave is .083008, and it contains 4.63162 major commas; ſee Holder's "Treatiſe on Harmony," p. 103, and Overend's MS. in the library of the Royal Inſtitution, vol. iii. p. 49.

HEMITONE of Euclid; the greater in his diatonum molle, is $\frac{9}{36}$ths or $\frac{3}{10}$ths of the diateſſaron or fourth, anſwering to the interval from C to D (according to Overend), is, in Farey's notation, $= 76.27168\,\Sigma + f + 7m$, or $76\frac{1}{5} + 1\frac{1}{2}f + 6\frac{3}{5}m$, whoſe common logarithm is .96251813.7912; its binary or Euler's logarithm is .1245114, and it contains 6.947433 major commas.

HEMITONE, *Greater*, or maximus of Holder, is an interval whoſe ratio is $\frac{25}{27} = 68\,\Sigma + f + 6m$, which is the SEMITONE *maximum* of Overend; ſee that article.

HEMITONE, *Major*, or *Hemitone* of Dr. Smith, is an interval whoſe ratio is $\frac{15}{16} = 57\,\Sigma + f + 5m$, which is the SEMITONE *major* of the nomenclature which we have adopted from Overend; ſee that article.

HEMITONE, *Major*, of Boethius, has a ratio of $\frac{2048}{2187}$, $= 58\,\Sigma + f + 5m$, and is the *apotome* of the Greek ſcales of muſic, of Pythagoras, Overend, &c.; it is the abſciſs of Dr. Boyce, the *flat* and *ſharp* of Dr. Calcott (Grammar, p. 112.), and of Overend's great ſcale, the ſharp of Dr. Boyce; the chromatic ſemitone of Dr. Callcott, &c.

In our article APOTOME, we omitted to ſtate the value of this interval in the different notations, which therefore we ſhall ſupply in this place, after noticing, that by miſtake its ratio was there ſtated to be $\frac{2187}{2048}$, inſtead of $\frac{2048}{2187}$, as above: which in its component primes is $\frac{2^{11}}{3^7}$; its common logarithm is .9714811.6927, and its binary or Euler's log. or decimal part of the octave = .094734; it contains 5.28613 major commas and 58.188976 ſchiſmas; it is equal $2\,\mathrm{T} - \mathrm{t} - \mathrm{s}$. The apotome is formed by the addition of the following pairs of intervals, *viz.* a ſemitone major and a ſchiſma; a limma and a diaſchiſma; a ſemitone medius and a major comma; a ſemitone minimum and a chromatic dieſis; a ſemitone minor and two major commas; a major reſidual and two chromatic dieſes; a ſemitone ſubminimis and three major commas; a priſma and four diaſchiſmas; a dieze minime and four major commas; a medius reſidual and five major commas, &c.

It is alſo equal to the difference between the following intervals in pairs, *viz.* a major tone and a limma; a ſemitone maximum and a minor comma; a tone maximum and a ſemitone major; two minor ſemitones and a dieze minime; two ſemitones minimum and a major reſidual; two ſemitones medius, and a minor ſemitone; three minor ſemitones and two ſemitones ſubminimis; four ſemitones ſubminimis and three dieze minime, five dieze minime and four medius reſiduals, &c. Our general table ſhews in like manner, fifteen ways in which the apotome can be compounded of the ſum of three intervals; 24 in which it reſults from taking one interval from the ſum of two others, and 22 where it reſults from taking the ſum of two intervals from a ſingle one, but the above muſt ſuffice, except mentioning, that this interval is equal to 7 V — 4 VIII, 3 V — 4 4ths, or 3 3 + 3 III — 4 4ths by either of which it can be correctly tuned by perfect concords, on an inſtrument having a ſufficient number of ſtrings or pipes.

HEMITONE *Medium* of Holder, is an interval whoſe ratio is $\frac{12}{13}\frac{8}{5} = 47\,\Sigma + f + 4m$, or the SEMITONE *medius*; which ſee.

HEMITONE *Minor*, of Holder, or leſs half note, has a ratio of $\frac{24}{25} = 36\,\Sigma + f + 3m$, or the SEMITONE *minor*; which ſee.

HEMITONE *Minor* of Boethius and Sauveur; the ancient hemitone mentioned by Pythagoras, Ariſtoxenus, &c. It is what a fourth exceeds two major tones, and has a ratio of $\frac{243}{256} = 46\,\Sigma + f + 4m$, or the *Limma*; which ſee.

HEMITONE *Minimum* of Holder, has a ratio of $\frac{625}{648} = 32\,\Sigma + 3m$, or the SEMITONE *minimum*; ſee that article.

HEMITONE, *Artificial*, of Holder, is an interval whoſe ratio is $\frac{19}{20} = 45.270982\,\Sigma + f + 4m$; its common logarithm being .9777236.0529, its Euler's log. = .074006, and it contains 4.129058 major commas. Mr. Holder obſerves, that this hemitone differs from the limma of Pythagoras only by the ratio $\frac{1215}{1216}$, which is .270982 Σ, as above.

HEMITONE, *Greater*, of Quintilian, is an interval whoſe ratio is $\frac{16}{17} = 53.53181\,\Sigma + f + 5m$, its common logarithm is .9736710.6128, its Euler's logarithm, or decimal of the octave, is .087463, and it contains 4.88023 major commas. This is the falſe ſemitone of the trumpet and French-horn, being four octaves below the ſound yielded by $\frac{1}{17}$th part of the whole length of the tube, or fundamental.

HEMITONE, *Leſſer*, of Quintilian, has a ratio of $\frac{17}{18} = 50.46033\,\Sigma + f + 5m$; its common logarithm is ·9751764.1627, its Euler's logarithm = .082462, and it contains 4.601184 major commas. Dr. T. Young, in his account of his HARMONIC *Sliders*, (ſee that article,) calls this an imperfect *uniſon*.

HEMITONE, *Subminimis*, of Merſennus, Holder, &c. is an interval whoſe ratio is $\frac{24}{25}\frac{3}{0} = 25\,\Sigma + f + 2m$, or the SEMITONE *ſubminimis*; which ſee.

HEMITONE *Wolf*, is the ſmall diſcordant interval which reſults, between eleven major hemitones or ſemitones and the octave, which in Mr Farey's notation is $14.70068\,\Sigma + f + m$, or $15\,\Sigma - f + m$, equal to the ſum of the major reſidual and nine ſchiſmas, the greater fraction and 14 ſchiſmas, &c.; its common logarithm is .9927140.3606, its Euler's logarithm = .02420, and it contains 1.35056 major commas.

HEMITRITÆUS, in *Medicine*. See FEVER, *Semitertian*.

HEMITROPE, in *Cryſtallography*, a ſpecies of reverſed cryſtals, ſo termed by Haüy. Rome de l'Iſle calls them *Maches*, which ſee.

HEMIXESTON, a meaſure amongſt the ancients, containing

taining half a xeſtes. The xeſtes contained two cotyles, and therefore the hemixeſton was a cotyle.

HEMLOCK, in *Botany*. See CICUTA and CONIUM.

HEMLOCK, in the *Materia Medica*. See CICUTA.

HEMLOCK, *Great Broad-leaved Baſtard*. See LIGUSTICUM.

HEMLOCK, *Leſſer*. See ÆTHUSA.

HEMLOCK, *Water*. See CICUTA.

HEMLOCK, *Drop-wort*. See OENANTHE.

HEMLOCK *Lake*, in *Geography*, a ſmall lake of America, in the ſtate of New York, in Geneſſee county, 12 miles long and one broad; 30 miles S. of lake Ontario.

HEMMAU, a town of Bavaria, in the principality of Neuburg; 12 miles W. of Ratiſbon.

HEMMENDORF, a town of Germany, in the principality of Calenberg, ſituated on the Saale; 12 miles E. of Hameln.

HEMMINGFORD, WALTER DE, in *Biography*, an Engliſh chronicler of the 14th century, whoſe work extends from 1066 to 1303. He was an eccleſiaſtic in Giſborough abbey, Yorkſhire, and died in 1347.

HEMORRHAGE, or HEMORRHAGY, in *Surgery*, is a ſubject of the higheſt importance; the many accidents which give riſe to alarming effuſions of blood, the bleeding neceſſarily attendant on all operations, and the awful ſuddenneſs with which life is loſt, when any ſerious hemorrhage is not immediately checked, are circumſtances fully ſufficient to impreſs upon the mind the neceſſity of being prepared to render aſſiſtance without the leaſt heſitation or delay. There are ſeveral parts of practice which leave the ſurgeon ſome little leiſure to refer to his books, refreſh his memory, and ſeek the advice of others. In the caſe of hemorrhage it is moſt frequently otherwiſe.

There is one thing proper to be done, and if the practitioner does not do it expeditiouſly, his patient will die before his eyes. Thus, the life of a fellow creature will be ſacrificed to his ignorance, or indeciſion; his own reputation and honour will be moſt juſtly forfeited; and the angry world will ever afterwards only mention him with reproaches. In many inſtances, an unſkilful ſurgeon is a ſort of authorized murderer, let looſe upon ſociety. It is difficult to ſay, whether he kills moſt, by doing what he ought not to do, or by leaving undone the things which ought to be done. The law cannot bring him to the gallows; for, what he does is an error of judgment; and when his conduct deſerves the moſt ignominious puniſhment, ſo unknowing are people in general in ſurgical matters, that they frequently thank and reward him, when he ſhould be kicked, put in the pillory, or hanged. Sometimes, however, his errors and ignorance ſtrike every bye-ſtander; he occaſions, with his own knife, a profuſe bleeding, and does not know how to ſtop it; the patient actually periſhes under his hands. Or, in other inſtances, he is called to a perſon who is wounded and bleeding largely; he knows not what to do; and, before his confuſion and heſitation are over, the poor patient breathes his laſt. On other occaſions, he adopts ſome improper method for putting a ſtop to the hemorrhage, ſo that the blood eſcapes from time to time, till the patient has fallen a more gradual victim.

"Hemorrhage (ſays a late excellent writer), the inevitable attendant on operative ſurgery, impreſſes mankind with a ſentiment of horror, and may on this, and many other accounts, be conſidered as one of the moſt formidable opponents to its improvement. It obſcures, retards, and embarraſſes the progreſs of every operation, and the juſt dread of its fatal conſequences is the chief cauſe of diffidence in the operator. But, not only as a conſequence of ſurgery is hemorrhage to be feared; it is alſo one of the moſt alarming and dangerous accidents which ſurgery is called upon to relieve. "Un ſentiment naturel (obſerves Morand) attache à l'idée de perdre ſon ſang, un terreur machinale, dont l'enfant, qui commence à parler, et l'homme le plus decidé, ſont également ſuſceptibles. On ne peut point dire que cette peur ſoit chimérique. Si l'on comptoit ceux, qui perdent la vie dans une bataille, on verroit que les trois quarts ont peri par quelque hemorrhagie; et dans les grands operations de chirurgie, cet accident eſt toujours le plus formidable." Jones on Hemorrhage, p. 6.

In caſes of bleeding, the ſurgeon feels himſelf ſo reſponſible, that to him it is truly an anxious ſcene. If the bleeding be ſlow and gradual, from ſome extenſive ſurface, as from a polypus of the noſtrils, from the womb, from the ſurface of a ſtump, or from ſome large ſore, (as Mr. John Bell remarks,) the ſurgeon is ſent for from hour to hour, he is called during the night; he is made unhappy for weeks; and, after repeated uncontrollable hemorrhages, he ſees his patient expire. But, if there be a ſudden bleeding from the veſſels cut in any operation, or from an aneuriſm, or from ſome great wound, the arteries of which cannot be diſcovered, there is immediate danger of the patient expiring even in the ſurgeon's hands. Let thoſe who have witneſſed the agitation of ſuch ſcenes, judge of the importance of the preſent ſubject. The fear of hemorrhage is always uppermoſt in the mind of the young ſurgeon. Were this one danger removed, he would go forward in his profeſſion almoſt without fear.

It is the guſhing of the blood from the great arteries, and the fainting of the patient, which hurry our moſt important operations, and makes all the difference betwixt operating on the living body and diſſecting the dead. Theſe are the things which at times make the hands of the boldeſt ſurgeon unſteady, and his heart ſink within him. No ſurgeon nor ſpectator can keep the natural colour of his cheek, when a patient is expiring, or in danger of expiring, from loſs of blood; and the actual death of the patient muſt leave a laſting melancholy on the ſurgeon's mind.

It is really this accident of hemorrhage, that has for ages retarded the improvement of ſurgery. The ancients, ignorant of the ways of ſtopping bleeding, did not venture to cut out the moſt trivial tumour, or they did ſo with fear and uncertainty. Such operations as we now perform rapidly and ſafely with the knife, they executed ſlowly, or imperfectly, with burning irons or ligatures. If they ventured to amputate a member, it was only by cutting through the mortified parts, and ſo great was their dread of blood, that they were afraid to divide the living fleſh. John Bell's Principles of Surgery, vol. i. p. 142.

The ſurgeon, who hopes to exerciſe his profeſſion with honour, ought to poſſeſs an adequate knowledge of the ſtructure and courſe of the blood-veſſels, have juſt ideas of the circulation, be well acquainted with what modern inveſtigation has made out, concerning the proceſs of nature in ſuppreſſing hemorrhage, and underſtand the comparative merits of all the plans, which the ingenuity of man has deviſed for the ſame deſirable purpoſe. The anatomical and phyſiological departments of this work will afford the neceſſary information, in regard to the track of the arteries and veins, and the circulation of the blood. Our province is chiefly to detail the various proceedings which have been adopted for the ſuppreſſion of hemorrhage, and to notice ſome improvements and intereſting facts, which ſome ingenious men have lately brought to light. A few preliminary obſervations, however, are firſt proper.

When an artery is wounded, the blood is of a bright

ſcarlet colour, and guſhes from the veſſel *per ſaltum*, and with great rapidity. The blood iſſues from a vein in an even, unbroken ſtream, and is of a dark purple red colour.

In conſequence of the greater celerity, with which the blood flows in the arteries, their wounds are, generally ſpeaking, much more dangerous than thoſe of the veins, being far more difficult to heal, and attended with much greater hemorrhage. Beſides, experience ſhews, that the conſtitution cannot bear the loſs of ſo much arterial as it can of venous blood; and though it will often bear the loſs of a large quantity, either of arterial or venous blood, provided ſuch quantity is loſt ſlowly and gradually, yet it is found, that when a great deal of blood is loſt in the ſudden way, as it often is in wounds of the large arteries, the conſequences are generally ſoon fatal. Even when the patient ſurvives the immediate effects of a conſiderable and ſudden hemorrhage from an artery, it too frequently happens, that the weakneſs induced does not quickly go off, but laſts an immoderate time, and becomes the foundation of obſtinate and fatal diſeaſes.

The contraction of the ventricles of the heart drives the blood into all the arteries of the body. The office of the veins is to bring back to the heart ſuch blood as is not ſeparated by the ſecerning arteries, for the purpoſes of ſecretion and nutrition. Hence, it muſt be plain, that the current of the blood in the arteries is in a direction leading from the heart, while that of the blood in the veins runs towards this important organ. It muſt be equally manifeſt, that preſſure, made on that portion of a wounded artery, which adjoins the wound towards the heart, will tend to ſtop the bleeding; and that, in order to check any hemorrhage from a vein, the preſſure or impediment to the bleeding muſt be applied to that ſide of the wound which is moſt remote from the heart.

The wounds of certain blood-veſſels, particularly of ſome very near the ſource of the circulation, whether of arteries or veins, may be regarded as mortal. Thus wounds, either of the aorta or vena cava, of the pulmonary artery, or veins of the ſubclavian, internal jugular vein, &c. are fatal. The blood goes out of the heart into the large trunks of the arterial ſyſtem with great velocity; and it is clear, that this fluid muſt be returned to the heart through the trunks of the veins with ſufficient quickneſs to furniſh a ſupply to that organ equal to the quantity which is expelled by every ſtroke of the ventricles. Therefore, the blood is found to flow in the veins near the heart with an immenſe impetus, and their wounds are as perilous as if the injured veſſels were actually arteries.

As the ſyſtem will not bear the loſs of above a certain quantity of blood at a time, the bleeding may be ſaid to demand moſt urgently the firſt attention of the ſurgeon in every wound, whether produced by an accident or an operation. Were he to loſe time in preparing the dreſſings before he had ſecured the bleeding-veſſels, the patient would frequently bleed to death before his eyes. Were an operation to proceed in completing the exciſion of a large tumour, without tying the large veſſels regularly as they are divided, the patient would often be dead before the ſeparation of the whole ſwelling was accompliſhed.

The ſubſtance of which arteries is compoſed, is diviſible into three diſtinct parts, named by anatomiſts tunics or coats. The internal coat is very thin and ſmooth, is elaſtic and firm in the longitudinal direction, but "ſo weak in the circular, as to be very eaſily torn by the ſlighteſt force applied in that direction."

The middle coat is the thickeſt, conſiſting of circular layers of fibres, reſembling thoſe of muſcles, but differing from them in poſſeſſing a remarkable degree of elaſticity. It is this coat which keeps an empty and dead artery open and of a round form. As this coat has no longitudinal fibres, "the circular fibres are held together by a ſlender connection, which yields readily to any force applied in the circumference of the artery."

The external coat is remarkable for its whiteneſs, denſity, and great elaſticity. The ſtrength of the artery chiefly depends on it; ſo much ſo, that if the veſſel be ſurrounded with a tight ligature, its middle and internal coats will be as completely divided by it, as they can be with a knife, whilſt the external coat will remain entire.

Beſides theſe proper coats, the arteries are connected by cellular ſubſtance with ſheaths. "If an artery be divided, the divided parts, owing to their elaſticity, recede from each other, and the length of the cellular fibres connecting the artery with the ſheath admits of its retracting a certain way within the ſheath."

Arteries are ſupplied with ſmall arteries and veins, the vaſa vaſorum, and with abſorbents and nerves. "This ſtructure makes them ſuſceptible of every change to which living parts are ſubjected in common; enables them to inflame when injured, and to pour out coagulating lymph, by which the injury is repaired, or the tube is permanently cloſed." See Jones on Hemorrhage, p. 1—5.

The vaſt importance of the blood in ſupporting the functions of the animal economy has, at all times, excited the attention of practitioners to the cauſes of bleeding, and the means of ſtopping it. Hemorrhages have been divided into two kinds, *idiopathic* and *ſymptomatic*. The firſt are uſually produced by the ſpontaneous rupture of the veſſels, and are attended with a ſtate of extraordinary fulneſs of the ſanguineous ſyſtem. They are frequently accompanied with ſome degree of fever, and always ſeem to depend upon a more or leſs increaſed action of the bleeding veſſels, brought on by ſome internal cauſe. They are alſo denominated *active* hemorrhages.

The *ſymptomatic*, or *paſſive* hemorrhages are ſuch as are not neceſſarily connected with a ſtate of plethora; but, generally, originate from ſome external local cauſe.

The conſideration of idiopathic hemorrhages belongs to the phyſician. All thoſe of the paſſive kind come within the province of the ſurgeon, and, in this part of practice, modern improvements of the moſt important kind have been introduced. If there be any one thing which tends more than any other to give a practitioner of the preſent day an advantage over a ſurgeon of former times, it is the better knowledge, which now prevails, in relation to the methods of ſtopping hemorrhage. However, we may ſay, that it has not been till very lately, that ſeveral conſiderable ſteps to perfection have been made. Before the valuable publication of Dr. Jones, many incorrect notions were entertained; nor were the principles on which we ought to proceed in checking the bleeding from large arteries well underſtood. In our opinion, the ſurgical profeſſion, and mankind in general, are greatly indebted to this gentleman for his very able elucidations. It will be ſeen in the ſequel of this article, that the ancients were not entirely ignorant of ſome of the chief means of ſtopping hemorrhage; but, their not being acquainted with the circulation of the blood, their imperfect knowledge of anatomy, and, perhaps, other cauſes, hindered them from adopting plans which certainly ſeem to have come within the ſcope of their information.

Celſus recommends, for the purpoſe of ſtopping hemorrhage, the wound to be filled with dry lint, and a ſponge dipped in cold water to be applied over the lint, and made to

preſs

preſs upon the part with the hand. When, notwithſtanding this method, the bleeding continues, he adviſes freſh lint wet with vinegar to be repeatedly put on the wound; but he forbids the employment of eroding eſcharotic applications, though adviſed by others for this object, becauſe they are apt to give riſe to conſiderable inflammation. He prefers, at all events, the mildeſt of this claſs of dreſſings. When the hemorrhage reſiſts the foregoing means, he recommends the wounded part of the veſſel to be tied with two ligatures, and the intervening portion to be cut through, ſo that the veſſel may heal up in the wound, and the two orifices become firmly cloſed. When the ligature cannot be applied, he propoſes the actual cautery, in caſe the wound has bled enough, and there are no muſcles nor nerves in it; as on the forehead and top of the head, parts which Celſus erroneouſly ſuppoſed were not furniſhed with ſuch organs.

Galen alſo makes mention of the ligature for ſtopping the bleeding in caſes of wounds. Some alluſions to it are likewiſe ſaid to exiſt in ſtill more ancient writers, as Archigenes and Rufus. But it is more than probable, that in the times of theſe men, the ligature was ſcarcely ever employed. This opinion ſeems to be comfirmed by the conſideration of the great number of topical aſtringents, cauſtics, and other things, which the ancients have recommended for the ſuppreſſion of hemorrhages, and upon which little reliance would have been placed, had the practice of the ligature been at all common. Beſides, there cannot be a doubt, that, if the old ſurgeons had been familiar with the method of tying the arteries, they would ſoon have extended the ligature to caſes of amputation. However, ſo far were they from doing this, that, at a much later period, we find Albucaſis afraid to cut off an arm at the wriſt, leſt the patient ſhould periſh from loſs of blood.

Paré is accounted the firſt ſurgeon who uſed the ligature in amputations. An attack was made by ſome of his contemporaries upon his practice, a modeſt defence of which he inſerted in the part of his works, entitled *Apologie*. He takes great pains to impute the invention of the ligature to the ancients, and quotes a great many of them who have ſpoken of it; but its application, in caſes of amputation, he regards as ſo highly important, that he thinks himſelf inſpired by God in being the firſt to uſe it in this manner.

The cauterization of the cut veſſel, and of ſome of the ſurrounding fleſh, was what the ancients chiefly depended upon for ſtopping hemorrhage. The parts, which were thus acted upon by the fire, formed an eſchar more or leſs thick, which blocked up the opening in the veſſel, and prevented the eſcape of the blood. But, frequently, the eſchar was thrown off too ſoon, and the bleeding recurred. The danger was now greater than at firſt, inaſmuch as there was more difficulty in ſtopping the hemorrhage, than before the application of the cautery. Sometimes it happened alſo that the inſtrument, in conſequence of being made too hot, brought away with it the eſchar which it had juſt produced. At preſent, the actual cautery is never uſed in this country for the ſuppreſſion of hemorrhage. In France, indeed, the employment of it is yet deemed juſtifiable in a few particular inſtances, in which the ligature and compreſſions are both impracticable; but we entertain no doubt that the practice will in the courſe of time be univerſally abandoned. A plan, equally barbarous, was purſued for a great length of time; it was to cauterize the orifices of the bleeding-veſſels, by touching them with pledgets dipped in boiling oil of turpentine. We are happy to add, that this method has alſo been given up. See Encyclopédie Methodique, art. *Hémorrhage*.

Before we enter into a detail of the various means of ſtopping hemorrhage, we think it right to deliver an account of the different theories which have prevailed, reſpecting the natural proceſs by which bleedings are ſuppreſſed. When this is underſtood, a more correct judgment may be formed of the merits of each particular mode of treatment, ſince it will be known, that whatever diſturbs or impedes that proceſs, cannot be conſidered as good ſurgery. Much has been made out by Dr. Jones on this ſubject, and we feel highly indebted to this gentleman for the advantages and aſſiſtance which we have derived from his able criticiſms, and perſpicuous explanations.

Although the ancients were undoubtedly acquainted with the plan of tying bleeding veſſels, they do not appear to have made it their common practice. On the contrary, inſtead of undertaking rational enquiries and experiments, which might have led them to employ the ligature more extenſively, they contented themſelves with empirical attempts to check every hemorrhage with drugs, or the inſecure, yet terrible means of cauſtic and fire.

The celebrated French ſurgeon, Petit, in the year 1731, firſt endeavoured to give an explanation of the means, which nature employs, for the ſuppreſſion of hemorrhage. Upon this ſubject, he publiſhed three memoirs in the courſe of a few years, productions which, (to uſe the words of Dr. Jones,) will ever be conſidered by candid readers, as invaluable contributions to ſurgery, and indubitable proofs of the author's penetration, accuracy, and fidelity.

It was the doctrine of Petit, that hemorrhage from a divided artery is ſtopped by the formation of a clot of blood, (caillot de ſang,) which is ſituated partly *within*, and partly *without* the veſſel. He thought that the external portion is formed by the laſt drops of blood which iſſue from it; the internal portion by the blood contained juſt within its divided extremity; the former he called the *couvercle*, the latter the *bouchon*. The clot, according to Petit, afterwards becomes adherent to the internal coat of the veſſel, to its orifice, and to the ſurrounding parts. He further ſtates, that when bleeding is ſtopped by the application of a ligature, a clot is formed above the ligature, and the coagula, under theſe circumſtances, only differ in figure. This view of the ſubject led him to recommend compreſſion to ſupport the clot, that it may not be puſhed away by the impulſe of the blood.

In 1736 Morand publiſhed a memoir, in which he added many intereſting remarks to thoſe which had been made by his countryman Petit. He admitted that the formation of a coagulum, had ſome effect in ſtopping hemorrhage; but contended that the changes which the artery undergoes, alſo contribute to that effect. Theſe changes are deſcribed as being a ſort of corrugation or plaiting of the circular fibres of the artery, by which its canal is diminiſhed, and a ſhortening, and conſequent thickening, of its longitudinal fibres, ſo as nearly to fill it up. Morand conceived that this latter effect was produced when an artery is completely divided, and that it conſtitutes the principal means by which, in ſuch caſes, the hemorrhage is ſtopped. He thought alſo, that the corrugation, or puckering of an artery, might take place ſo as to obliterate its cavity, provided preſſure be made round it, as happens when a ligature is applied.

As Dr. Jones remarks, it is clear that Morand alluded to the contraction and retraction of arteries, and that he erred chiefly in his explanation of the way, in which ſuch effects are produced. The retraction is imputed to longitudinal fibres, which, according to the beſt anatomiſts, do not exiſt in the arteries of the human body. However, though Morand entertained very erroneous notions of the ſtructure and

action of the arteries, yet Dr. Jones does him the juſtice to acknowledge that this does not affect the truth of his general concluſion, that the change produced on a divided artery, contributes, with the coagulum, to ſtop the flow of blood.

The opinion of Morand was alſo that which Mr. Samuel Sharp maintained. "The blood-veſſels, immediately upon their diviſion, bleed freely, and continue bleeding, till they are either ſtopped by art, or, at length contracting and withdrawing themſelves into the wound, their extremities are ſhut up by the coagulated blood." Operations of Surgery, edit. 2. 1739.

Dr. Jones obſerves that this explanation is true as far as it goes; but not ſufficiently comprehenſive.

Pouteau denied that a coagulum is always to be found after the diviſion of an artery; and when it is, he thought that it ſhould only be conſidered as a feeble and ſubſidiary means towards the ſuppreſſion of hemorrhage. He contended that the retraction of the artery had not been demonſtrated, and that, at any rate, it was not more effectual than the coagulum. His theory was, that a ſwelling of the cellular membrane, at the circumference of the cut extremity of the artery, forms the principal impediment to the flow of blood; and that the application of a ligature to an artery is uſeful by promoting a more immediate and extenſive induration of the cellular ſubſtance.

Mr. Gooch oppoſed the doctrine of Petit, concerning the effect which the coagulum had in the ſuppreſſion of hemorrhage; in delivering his own theory, he intermingles ſome of Pouteau's notions with his own. In the firſt volume of his ſurgery, he ſays: "when a ſmall artery in a limb, or any external part of the body, is totally divided, its retraction may bring it under the ſurrounding parts, and with the natural contraction of the diameter of its mouth, aſſiſted by the compreſſive power of thoſe parts, increaſed by their growing tumid, the efflux of blood may be ſtopped."

Gooch, White, and Aikin conſidered the experiments of Kirkland quite concluſive in confuting the doctrine of hemorrhage being ſtopped by a coagulum, and in eſtabliſhing the contraction of the arteries, as the means which nature employs in the ſtoppage of bleeding from divided arteries. White gives an unqualified aſſent to the opinions of Kirkland: "In regard to the means which nature employs in the ſtoppage of hemorrhages from divided arteries, (ſays Mr. White,) I never thought Petit's theory of a coagulum at all probable; a coagulum of blood, formed at the end of an artery, is as far from being of any ſervice, except in ſome few caſes, where the air cannot get admiſſion, that it is abſolutely prejudicial, as I have often obſerved, and ſhould always be removed before the application of ſponge, or any fungous ſubſtance.

"Pouteau's hypotheſis, that the ſwelling of the ſurrounding cellular ſubſtance cloſed the artery, ſeemed more probable; but I am now convinced from ſeveral obſervations, that according to the ſuppoſition of Mr. Gooch, ſince confirmed by my ingenious friend Mr. Kirkland, the arteries, by their natural contraction, coaleſce, as far as their firſt ramification." White's Caſes in Surgery.

We ſhall not lengthen this article with detailing the experiments undertaken by Kirkland. They were not of the right kind, and have juſtly incurred the following criticiſm from Dr. Jones. "Mr. Kirkland wiſhed to determine the effects of temporary preſſure on arteries, and therefore in his experiments, 'he applied a tourniquet on the limb, a ligature on the artery, or his finger to the mouth of the artery.' All theſe are artificial means, taking off the force of the circulation from the extremity of the artery, and allowing it to undergo thoſe changes proper to the new condition into which it is brought. One circumſtance only being omitted, the means can no longer be natural; eſpecially when it is that one moſt important circumſtance of all, the ſource of our anxiety and alarm, namely, the impetuous flowing of the blood through the wound of the artery. It is the hemorrhage itſelf which reſiſts the contraction of the artery to a degree that would, in almoſt every inſtance, be attended with fatal conſequences, (the artery being ſuppoſed large enough to admit of ſuch conſequences,) but for a coagulum," whoſe formation, ſituation, and uſe, Dr. Jones has moſt ably deſcribed. Mr. White's concluſions being drawn *from the condition of a tied artery*, are alſo very properly objected to by this gentleman as being unfit to explain *the condition of a divided artery left to nature.*

Mr. John Bell has advanced a theory, that the bleeding from divided arteries is ſuppreſſed by the cellular ſubſtance around them becoming injected with blood. However the account which this author gives of the ſubject is extremely vague and inconſiſtent, and has met with the animadverſions of that accurate obſerver Dr. Jones.

All the foregoing theories, relative to the natural means by which bleeding is ſtopped, are deficient and not ſufficiently comprehenſive. There is, as Dr. Jones remarks, an unjuſtifiable propenſity in each of the preceding writers, to aſſign the whole effect to one circumſtance alone, regardleſs alike of the obſervations of others, and of the general analogy of the operations of the animal economy.

A regular ſeries of experiments which Dr. Jones undertook, exhibit the proceſs as a leſs ſimple, but more ſatisfactory one. They ſhew that the blood, the action, and even the ſtructure of arteries, their ſheath, and the cellular ſubſtance connecting them with it; in ſhort, that all the parts concerned in, or affected by hemorrhage, contribute to arreſt its fatal progreſs, by operating, in the caſe of a divided artery, as follows. "An impetuous flow of blood, a ſudden and forcible retraction of the artery within its ſheath, and a ſlight contraction of its extremity, are the immediate and almoſt ſimultaneous effects of its diviſion. The natural impulſe, however, with which the blood is driven on, in ſome meaſure, counteracts the retraction, and reſiſts the contraction of the artery. The blood is effuſed into the cellular ſubſtance, between the artery and its ſheath, and, paſſing through that canal of the ſheath which had been formed by the retraction of the artery, flows freely externally, or is extravaſated into the ſurrounding cellular membrane in proportion to the open or confined ſtate of the wound. The retracting artery leaves the internal ſurface of the ſheath uneven by lacerating or ſtretching the cellular fibres that connected them. Theſe fibres entangle the blood as it flows, and thus the foundation is laid for the formation of a coagulum at the mouth of the artery, and which appears to be completed by the blood as it paſſes through the canal of the ſheath, gradually adhering and coagulating around its internal ſurface, till it completely fills it up from the circumference to the centre.

"A certain degree of obſtruction to the hemorrhage, which reſults from the effuſion of blood into the ſurrounding cellular membrane, and between the artery and its ſheath, but particularly the diminiſhed force and velocity of the circulation, occaſioned by the hemorrhage, and the ſpeedy coagulation of the blood, which is a well known conſequence of ſuch diminiſhed action of the vaſcular ſyſtem, moſt eſſentially contribute to the accompliſhment of this important and deſirable effect.

"A coagulum then (continues Dr. Jones), formed at the

the mouth of the artery, and within its ſheath, and which I have diſtinguiſhed in the experiments by the name of the *external* coagulum, preſents the firſt complete barrier to the effuſion of blood. This coagulum, viewed externally, appears like a continuation of the artery, but on cutting open the artery, its termination can be diſtinctly ſeen with the coagulum, completely ſhutting up its mouth, and incloſed in its ſheath.

"The mouth of the artery being no longer pervious, nor a collateral branch very near it, the blood juſt within it is at reſt, coagulates, and forms in general a ſlender, conical coagulum, which neither fills up the canal of the artery, nor adheres to its ſides, except by a ſmall portion of the circumference of its baſe which lies near the extremity of the veſſel. This coagulum is diſtinct from the former, and I have called it the internal coagulum.

"In the mean time, the cut extremity of the artery inflames, and the vaſæ vaſorum pour out lymph, which is prevented from eſcaping by the external coagulum. This lymph fills up the extremity of the artery, is ſituated between the internal and external coagula of blood, is ſomewhat intermingled with them, or adheres to them, and is firmly united all round to the internal coat of the artery.

"The permanent ſuppreſſion of the hemorrhage chiefly depends on this coagulum of lymph; but while it is forming within, the extremity of the artery is farther ſecured by a gradual contraction which it undergoes, and by an effuſion of lymph between its tunics, and into the cellular membrane ſurrounding it: in conſequence of which, theſe parts become thickened, and ſo completely incorporated with each other, that it is impoſſible to diſtinguiſh one from the other: thus, not only is the canal of the artery obliterated, but its extremity alſo is completely effaced, and blended with the ſurrounding parts.

"When the wound in the integuments is not healed by the firſt intention, coagulating lymph, which is ſoon effuſed, not only attaches the artery firmly to the ſubjacent and lateral parts, but alſo gives it a new covering, and completely excludes it from the external wound, which then goes on to fill up and heal in the uſual manner.

"The circumſtances now deſcribed (ſays Dr. Jones), are obſerved alſo in the inferior portion of the artery, or that which is ſupplied with blood by anaſtomoſis, with this difference only, that its orifice is generally more contracted, and the external coagulum is much ſmaller than the one which adheres to the mouth of the ſuperior portion of the artery, or that from which the blood flows in its direct courſe from the heart." Jones on the proceſs employed by nature in ſuppreſſing the hemorrhage from divided and punctured arteries, &c. p. 53, et ſeq.

With the exception of a few inſtances, in which the ſtrong retraction and contraction of a divided or lacerated artery prevent hemorrhage altogether, Dr. Jones alſo concludes, that a languid ſtate of the circulation is neceſſary for the accompliſhment of the natural means by which the bleeding is ſtopped.

The above occurrences are only diſcernible a certain time; for the impervious extremity of the veſſel gradually contracts, till its canal, as far as the firſt lateral branch, is obliterated, and its condenſed tunics aſſume a ligamentous appearance. The external coagulum which had ſtopped the hemorrhage at firſt, is abſorbed in the courſe of a few days, and the ſurrounding coagulating lymph which had thickened the parts, is gradually taken away.

At a ſtill later period, the ligamentous portion of the artery is converted into a mere filament. Thus, in the end, a complete annihilation of the veſſel takes place up to the place where the firſt lateral branch is given off. But, long before this final change is effected, the anaſtomiſing branches of both the upper and lower portion of the artery have become much larger, ſo as to tranſmit the blood into the inferior part of the limb, as well as if the circulation through the arterial trunk had never been obſtructed. According to Dr. Jones, the extent and formation of the internal coagulum depend very much on the diſtance at which the diviſion of the artery has happened from a lateral branch. Thus, if the veſſel is divided about a quarter of an inch beyond ſuch branch, ſcarcely any internal coagulum will be formed, as there is hardly any ſpace left for it between the effuſed lymph and the lateral ramification. But when the diviſion of an artery has taken place at ſome diſtance from a lateral branch, a long conical internal coagulum is then formed, the baſe of which is ſituated towards the extremity of the artery, generally adhering partially at its circumference to the inſide of the veſſel, cloſe to the coagulum of lymph.

The internal coagulum of blood does not fill up the canal of the veſſel, except where its baſe is ſituated, nor is it any where elſe adherent. On the other hand, "the coagulum of lymph is principally characterized by adhering almoſt throughout its whole extent to the internal ſurface of the artery."

Though the internal coagulum of blood at firſt does not fill up the artery, except juſt at its baſe, yet, when the veſſel afterwards contracts, the coagulum is cloſely embraced by it.

The external coagulum is always formed. The internal one contributes nothing to the ſuppreſſion of hemorrhage in ordinary accidents, becauſe its formation is uncertain, and, when formed, it rarely fills the canal of the artery, or does not adhere ſufficiently to the inſide of the veſſel. However, Dr. Jones informs us, that when the artery is lacerated, the internal coagulum may extend beyond many collateral branches, and adhere to the veſſel wherever it is lacerated, ſo as to be uſeful in preventing a return of the bleeding.

The foregoing are the principal facts which Dr. Jones has brought to light, in relation to the means employed by nature in ſtopping the hemorrhage from divided arteries. The experiments, illuſtrative of theſe facts, are all detailed by this gentleman, as appears to us, with equal candour and ability. He claims the merit of having corrected and perfected the theories of many men of great eminence, whoſe views of the ſubject were either more or leſs erroneous, or too circumſcribed.

With regard to the natural means by which the hemorrhage from punctured, or partially divided arteries is ſuppreſſed, Petit was the firſt who furniſhed accurate obſervations. Dr. Jones, however, has added to the elucidation of this part of the ſubject, as he has to that of the preceding. His experiments have confirmed, that the blood is effuſed into the cellular ſubſtance, between the artery and its ſheath for ſome diſtance, both above and below the wounded part; and that when the parts are examined a ſhort time after the hemorrhage has completely ſtopped, a ſtratum of coagulated blood is found lying between the artery and its ſheath, extending from a few inches below the wounded part to two or three inches above it, and being ſomewhat thicker or more prominent juſt over the wounded part than elſewhere.

The hemorrhage, which immediately follows the puncture of an artery, by filling the ſpace between the artery and its ſheath with blood, and conſequently diſtending the ſheath, alters the relative ſituation of the puncture in the ſheath to that in the artery, ſo that they are not exactly oppoſite each

other. By this means, a layer of blood is confined by the ſheath over the puncture in the artery, and by coagulating there prevents any further effuſion of blood. But, continues Dr. Jones, this coagulated blood, like the external coagulum of a divided artery, affords only a temporary barrier to the hemorrhage; its permanent ſuppreſſion is effected by a proceſs of reparation, or of obliteration, which takes place in the wounded artery. It is neceſſary, however, to recollect, that, on account of the elaſtic and contractile properties of the coats of the arteries, a great difference occurs in the degree in which the wound of the veſſel gapes, according as the puncture happens to be either longitudinal, oblique, or tranſverſe. The longitudinal, ſays Dr. Jones, appears to produce the ſlighteſt poſſible, or, perhaps, ſcarcely any ſeparation of the lips of the wound; the oblique occaſions a ſeparation proportioned to its extent; and the tranſverſe, however ſmall, ſeems to produce a circular aperture in the parietes of the artery.

The experiments of Dr. Jones alſo ſhew, that an artery, if wounded only to a moderate extent, is capable of reuniting and healing ſo completely, that, after a certain time, the cicatrization cannot be diſcovered, either on its internal or external ſurface; and that even oblique and tranſverſe wounds, when they do not open the artery to a greater extent than one-fourth of its circumference, are likewiſe filled up and healed, by an effuſion of coagulating lymph from their inflamed lips, ſo as to occaſion but little or no obſtruction in the canal of the artery.

However, Dr. Jones obſerves, it is difficult to determine the preciſe extent to which an artery may be wounded, and yet admit of being reunited. For, when the wound is very large, though not entirely beyond the poſſibility of being reunited, ſuch a quantity of coagulating lymph is poured out, that the canal of the veſſel at the wounded part is more or leſs filled up by it. When the wound is ſtill larger, the ſtrong tendency in the divided parts to retract keeps the undivided portion conſtantly on the ſtretch, ſo that it either is torn, or gives way in conſequence of ulceration.

Punctures in arteries, when they heal, are cloſed by lymph, which is effuſed from the lips of the wound of the veſſel, and alſo from the ſurrounding parts. Jones, page 116.

The foregoing obſervations will ſerve to make the reader acquainted with the nature of the proceſs, by which the bleeding from wounded arteries of a certain ſize is ſuppreſſed, without the interference of ſurgery. They will alſo qualify him for judging of the propriety, or impropriety, of ſeveral plans, which have been propoſed, or practiſed, for the object of ſtopping hemorrhage. We will now treat of ſome of theſe methods, and endeavour to ſhew what is objectionable; what praiſeworthy.

Actual Cautery.—This is one of the moſt ancient means employed for the purpoſe of ſuppreſſing hemorrhage, and conſiſted in applying a heated iron to the bleeding veſſels. The inſtrument was often put through a cannula, ſo that the ſurrounding fleſh might not be too much burnt. Former writers recommend every ſurgeon to provide himſelf with ſeveral cauteries of different ſizes, ſome with flat, others with button, or pointed extremities, ſo that he may always have one, which will be adapted to the mouths of the veſſels, without being likly to hurt any adjoining nervous, or tendious part. Such authors are very particular in their cautions and directions. They ſay, that the iron ſhould not be uſed quite red-hot, becauſe, if haſtily applied, and inſtantly removed, the eſchar will be apt to be pulled away with the inſtrument, and the patient undergo pain to no purpoſe, the bleeding continuing as forcibly as before. When the cautery was of a moderately glowing heat, the old ſurgeons uſed to take it out of the fire, ſtrike it againſt the grate, and rub it end againſt the floor, after which its extremity was immediately clapped upon the mouth of the artery, and turned two or three times round upon it.

The actual cautery, operated by producing an eſchar, which blocked up the mouth of the bleeding veſſel. Frequently, however, the eſchar came off at too early a period, the hemorrhage recurred, and the patient bled to death. Beſides the uncertainty, inefficacy, and inſecurity of the actual cautery, its application was attended with horrid pain, while the miſchief, neceſſarily produced by it upon the ſurfaces of wounds, muſt have made many of them incapable of healing in a moderate time, or without a great deal of inflammation, large abſceſſes, and a train of ſevere ſufferings. In fact, no perſon, acquainted with the general excellence of modern ſurgery, can retain a doubt, that, beſides the deaths from bleeding, many wounds were rendered fatal by the additional injury, which unavoidably aroſe from ſearing the fleſh with burning irons. As Mr. John Bell remarks, "the horrors of the patient, and his ungovernable cries, the hurry of the operator and aſſiſtants, the ſparkling of the irons, and the hiſſing of the blood againſt them, muſt have made terrible ſcenes, and ſurgery muſt in thoſe days have been a horrid trade."

"For one wound, and eſpecially for the amputation of a limb, many cauteries were required." Parée, in his ſpirited reply to Gourmaline, ſays to him, "if, ſir, in a ſiege, or in the aſſault of a city, where hundreds of ſoldiers have their limbs ſhattered, you ſhould chooſe to cauterize with burning irons, you would need a page to run backwards and forwards with your irons and furnaces to heat them in; and I ſhould little wonder, if, in the end, you were to be dragged out and ſtoned, as happened to Agatheus, one of the earlieſt ſurgeons in Rome." Principles of Surgery, vol. i. p. 151.

After this account, it is ſcarcely neceſſary for us to ſay, that the actual cautery is now never uſed for the ſuppreſſion of hemorrhage. It is reprobated by all approved writers on ſurgery as a barbarous and horrid method. At the ſame time, it is worthy of notice, that we find Default, and ſome diſtinguiſhed modern ſurgeons on the continent, occaſionally reſorting to this means in particular caſes, where the bleeding does not admit of the employment of preſſure, or of a ligature. In England, we are happy to ſtate, the cautery is never uſed; and yet, it gratifies our pride to think, that the practice of ſurgery is carried on here, in every one of its branches, with greater perfection, than in any other country in the world.

Potential Cautery.—Sometimes, inſtead of employing heated irons, the ſurgeons of former times applied to the bleeding veſſels cauſtics, ſtimulating things, and hot oil. Theſe were termed potential cauteries. In this way, even melted ſulphur and lead, and boiling oil of turpentine, were uſed. The latter was a very favourite application. Kettles of boiling turpentine were kept in readineſs in the cockpit during a battle at ſea, and in hoſpitals, where great operations were to be performed. The chief potential cautery, however, was blue vitriol, which was applied in the following manner. The vitriol was pounded, but not very finely, and it was wrapped up in a piece of rag. This was what was called a *button of vitriol*, which, when the bleeding had been checked by a tourniquet, was carefully placed on the mouth of the wounded artery. The cauſtic made an eſchar, juſt as the actual cautery did, and may be regarded as having a ſimilar mode of operation.

"We are to judge of theſe cauteries, boiling oils, vitriols, corroſive ſublimate, and other cauſtics, not by the horrors of the

the operation, nor the tranſitory pain of the moment, but by future conſequences; for the patient was continually expoſed to hemorrhagy. The eſchars might looſen too early, and of this accident, and of the ſudden hemorrhagy which followed, thouſands died; while few eſcaped a dangerous loſs of blood, and repeated cauterizing for many ſucceſſive dreſſings. In wounds the bones and tendons were expoſed, the muſcles waſted, and the arteries themſelves ſloughed, to a great extent, bleeding as long as the patient's blood retained any colour. And in amputations, the fleſh was waſted, the bone projected, and the ſtump was pyramidal and could not be cloſed." Principles of Surgery, vol. i. p. 152.

After theſe obſervations it becomes ſuperfluous to enjoin ſurgeons not to revive the uſe of the potential cautery for the ſtoppage of hemorrhages. It is not to be truſted to for this purpoſe, and its application is inevitably attended with the production of a great deal of miſchief. Cauſtics, if poſſible, are even worſe than the actual cautery; for their action is more tedious, leſs effectual, and leſs under the controul of the ſurgeon. The vitriol is diſſolved in the wound, and the irritating mixture then flows about and does incalculable injury to all the neighbouring parts without diſtinction.

Styptics and Aſtringents.—Styptics are ſubſtances, which have the property of producing a contraction of the veſſels; and, as ſome ſuppoſe, coagulation of the blood. Such are cold air, cold water, wine, brandy, ſpirits in general, diluted mineral acids, ſolutions of alum, blue vitriol, &c. Theſe ſubſtances do, indeed, poſſeſs the power of ſtopping ſome hemorrhages from ſmall veſſels, in which caſes, however, they are generally unneceſſary. In bleedings from large arteries, no prudent ſurgeon puts the leaſt reliance upon them.

The method of applying ſtyptic lotions is to dip ſome lint in them, and lay it upon the bleeding ſurface. Compreſſion is generally employed at the ſame time.

That cold air has a ſtyptic property, we have the moſt unequivocal proofs. We frequently tie on the ſurface of a wound every artery that betrays the leaſt diſpoſition to bleed, as long as the wound continues expoſed to the air. We bring the oppoſite ſides of this wound into contact, and put the patient to bed. Not an hour elapſes, before the renewal of hemorrhage neceſſitates us to remove the dreſſing. The wound is again expoſed to the air, and again the bleeding ceaſes. We have often ſeen this happen in the ſcrotum after the removal of the teſtis. The proper conduct, in ſuch caſes, is not to open the wound unneceſſarily, but to apply wet linen to the part, ſo as to produce ſuch evaporation from its ſurface, as ſhall create a ſufficient degree of cold to ſtop the bleeding. Firſt Lines of Surgery, chap. 13.

The chief ſtyptics, ſays Mr. John Bell, have been acids, ſolutions of vitriol, turpentine, and various ſolutions of aſtringent gums in ſpirit of wine. Theſe were invented by the regular phyſicians, and had their ſucceſſes in ſlighter hemorrhages; and the hope was always indulged of finding out ſome aſtringent ſufficiently powerful to ſuppreſs even the bleeding from an amputated limb. This eaſy and credulous temper of mind in men of our profeſſion has left the public very much expoſed to the practices of quacks. We know, by long experience, and many diſappointments, the inſignificancy of thoſe drugs which have been produced from the vegetable, or mineral kingdom, to ſerve as ſtyptics; we know them to be of little uſe farther than to check any ſlight bleeding of the noſe or gums. We no more expect any acid, ſpirituous, or ſaline body, to act as a ſtyptic, without cauſing pain, than we expect Digby's ſympathetic powder to act at the diſtance of many leagues. The chief ſecrets of empiries have been the neglected inventions of old phyſicians. We have never heard of any ſtyptic which has not proved in the end to be a ſolution of vitriol, or a ſpirituous ſolution of ſome aſtringent gum! What can be expected from the random inventions of ignorant people, whoſe ſole trade is that of cheating the public, and whoſe only ſkill is that of contriving and managing the deceit? From the time of Rewbell, to the celebrated Ruſpini, we have found diſappointment following quick after each fit of expectation; and though many, attracted by the proſpect of public rewards, have impoſed for a little while; though their ſtyptics have for a day borne an ineſtimable value; yet the charm has always vaniſhed with the ſecret! Such ſtyptics have no ſooner been bought by the king and parliament, and publicly prepared; they have no ſooner been digniſied with the high ſounding titles of royal ſtyptics, "Aqua Styptica Regalis," &c. &c. than they have been rejected and deſpiſed!

Rewbell's ſtyptic was publicly tried after an amputation in the Hoſpital of Invalids at Paris: the inventor himſelf made the application; but the poor patient bled to death under his hands!

Mr. John Bell informs us, that he has ſeen the lateſt of theſe inventions, Ruſpini's ſtyptic, tried in this place, (Edinburgh) where, he believes, it is eſteemed of much the ſame value as the ſympathetic powder of that famous knight and moſt complete gentleman, ſir Kenelm Digby, which ſympathetic powder ſtopped the blood as effectually, when it was applied to the weapon, as when it was applied to the wound itſelf! Principles of Surgery, vol. i. p. 152—154.

The ſuppoſition that there are any ſtyptics which have the quality of promoting the coagulation of the blood, is utterly void of foundation.

The application of ſtyptics to recent wounds cannot be too ſeverely reprobated. If the cut arteries are ſmall, they will leave off bleeding as ſoon as the wound is cloſed, and the dreſſings applied. If they are of a larger ſize, like thoſe of the fingers, the hemorrhage will generally ceaſe when the dreſſings have been put on, and a little preſſure is adopted. If the wounded veſſels are of a ſize ſtill more conſiderable, they muſt be tied; and we ourſelves have ſeen ſeveral lives nearly loſt by the ſurgeon raſhly perſiſting in the uſe of ſtyptic applications, in wounds of the radial artery, inſtead of having recourſe to a ligature at once, the application of which, after all, could not be avoided.

All ſtyptic and aſtringent applications are productive of great irritation upon the ſurfaces of wounds, ſo as to excite inflammation and ſuppuration, and entirely prevent union by the firſt intention. This deſirable mode of healing a wound, indeed, is quite out of the queſtion, when ſtyptics are uſed; becauſe its lips cannot be brought into contact in conſequence of the intervention of the ſtimulating applications between them.

Upon the whole, we may ſtate, as a general remark, that, in bleedings from ſmall veſſels, ſtyptics are totally unneceſſary; and that, in hemorrhages from large ones, they are ineffectual. In caſes of recent wounds, we think their employment injudicious, and repugnant to the true principles of ſurgery.

However, we will not altogether condemn their uſe in a few inſtances. In ſome bleedings from the noſe and gums, they are certainly convenient, and cannot do any harm. Hemorrhages, from particular ulcers, alſo admit of being checked by them, without any ill conſequences. We know that the ſurgeon occaſionally meets with bleedings from diſeaſed ſurfaces, where ſtyptics prove highly ſerviceable, on account of the veſſels having loſt their natural diſpoſition to contract. In theſe examples, we think, no ſur-

geons can object to a trial of ſtyptics. At the ſame time, it is proper to caution the inexperienced, that, what has been termed an hemorrhagic diſpoſition in wounds and ulcers is frequently entirely kept up by the irritating nature of the dreſſings.

Agaric and Sponge.—About the middle of the foregoing century, agaric, a fungus which grows upon old oak trees, acquired conſiderable fame for its extraordinary virtues in ſuppreſſing bleeding, not only from ſmall arteries, but from the large veſſels, which are divided in amputations. It was a French ſurgeon, named Broſſard, who brought it into general notice. He ſtopped bleedings from animals with it, and in La Charité publicly ſucceeded in effectually putting a ſtop to the hemorrhage after two amputations by M. Faget. The agaric for ſurgical uſe was gathered in the autumn, after a long continuance of very hot weather; and it was prepared by long keeping in a dry place, by cutting away the outſide rind, and beating it till it ſoftens, ſo as to admit of being torn with the fingers. It was cut into ſmall pieces, which, after the tourniquet had been tightened, were fixed upon the mouths of the bleeding arteries, ſupported by compreſſes, and bound firmly down in the wound with a fillet, which was carried up along the limb.

It is noticed by Mr. John Bell, that though the uſe of agaric in hemorrhages had actually been mentioned by Felix Wurtzius a hundred and fifty years before, yet M. Broſſard was liberally rewarded by his moſt Chriſtian majeſty. Pieces of prepared agaric were ſent from the French academy to our Royal Society, by whom they were committed to Mr. Warner for the purpoſe of trial. Warner made various experiments with agaric, which were generally ſucceſsful. He concludes, however, with obſerving, that agaric is ſtill more uſeful in old and ulcerating wounds, and in ſtumps, where the rottenneſs of the fleſh prevents the needle being uſed, than in amputations, or recent wounds. This diſcovery was thought to be perfect. M. Faget, in his enthuſiaſm, believed, that the needle was to be ſuperſeded by agaric. The diſcovery was alſo in this country a ſubject of great exultation. The virtues of agaric were equally extolled in the French Memoirs, and in our Philoſophical Tranſactions. It was reckoned to be not merely a ſponge, but an aſtringent, having very ſingular properties in making the veſſels contract; and one ſocietarian, ſuſpecting that it might be equally uſeful in internal hemorrhages, *boiled it*, like the German peaſant, who, in place of carrying the doctor's preſcriptions to a laboratory, rolled it up and ſwallowed it. Principles of Surgery, vol. i. p. 156.

After all the boaſting about the wonderful effects of agaric, ſober ſenſe has at laſt returned, and, at preſent, we hear nothing of it. In fact, like every other medicine which is brought into renown by a falſe character, it has ſunk into contempt, ſo much ſo, that there is not a ſurgeon who would not laugh at any one, who ſhould profeſs any confidence in it. Agaric does not poſſeſs the ſpecific property of ſtopping hemorrhage; and whatever good effects it may ſeem to have had, are more properly aſcribable to the compreſſion always made uſe of at the ſame time. If it has any real virtue, this is a mechanical one, ariſing from its ſoft ſpongy texture, which qualifies it for filling up all inequalities in the wound, and thus cloſing the veſſels. When we conſider, that agaric is intended to be applied to the mouth of the bleeding veſſel; and that, in this plan, the oppoſite ſurfaces of the wound cannot be brought into contact, we ſhall feel inclined to ſelect ſome other means, not quite ſo repugnant to the union of the wound. Compreſſion is often tried, becauſe the veſſel cannot be tied without difficulty, or, at leaſt, without having recourſe to an operation for the purpoſe of getting at it. But the employment of agaric is warranted by no ſuch reaſon; for its ſuppoſed ſpecific virtues require its application to be made directly to the divided artery. Agaric has alſo the inconvenience of acting as an extraneous ſubſtance in the wound, and, like compreſſes, it is liable to ſlip off the preciſe ſituation which it ought to occupy.

When the wounded veſſel is large, always prefer the ligature to agaric; when ſmaller veſſels bleed, compreſſion is much better than this vainly extolled ſubſtance. Firſt Lines of Surgery, chap. 13.

We need not ſay much concerning the uſe of common ſponge in the ſuppreſſion of hemorrhage. When uſed, in the way of agaric, it is liable to the ſame objections as this latter application. Sponge, however, is in a certain degree uſeful in checking particular hemorrhage; and this quality ariſes from its expanding nature when expoſed to any moiſture. Thus, when it is introduced into any deep narrow wound, which bleeds, it ſoon undergoes a conſiderable enlargement after it has imbibed the blood, ſo that it cloſely fills up the ſtab, and entirely prevents a further loſs of this ſalutary fluid. It does this in ſome inſtances; for, we would not have the reader to imagine, that the introduction of a piece of ſponge into a punctured wound, attended with hemorrhage, is always the proper practice. When the artery is of large ſize, the method will almoſt conſtantly fail, and, if the ligature is not uſed, the bleeding will return, or an aneuriſm be the conſequence. The introduction of ſponge is eminently uſeful in caſes of hemorrhage from within the rectum after the removal of piles. A piece of ſufficient ſize to diſtend the bleeding part of the inteſtine ought to be introduced to the proper place, and, on expanding, an effectual preſſure will be made upon the mouth of the bleeding veſſel. See HEMORRHOIDS.

Compreſſion.—This is executed by applying a bandage and compreſſes, in ſuch a manner that they mechanically ſtop the effuſion of blood. Formerly ſurgeons uſed to fill the cavities of wounds with charpie, and then make preſſure on the bleeding veſſels, by applying a tight roller over the part. The moderns underſtand too well the utility of not allowing any extraneous ſubſtance to intervene between the oppoſite ſurfaces of a recent wound, to perſiſt in the above plan, except in a few inſtances. They know that the ſides of the wound may be brought into contact, and that compreſſion may yet be adopted, ſo as both to reſtrain particular hemorrhages, and rather promote than retard the union of the wound. When the blood does not iſſue from any particular veſſels, but from numerous ſmall ones, compreſſion is preferable to the ligature. The employment of the latter would render it neceſſary to tie the whole ſurface of the wound. In order to make effectual compreſſion in this caſe, the wound is to have its oppoſite ſurfaces brought into contact; compreſſes are then to be placed over the wound, and a roller is to be applied as tightly as can be done without hazard of ſtopping the circulation in the part.

If compreſſion can ever be ſafely practiſed in bleedings from large arteries, it is when theſe veſſels run in the vicinity of a bone, againſt which they can be advantageouſly compreſſed. Bleedings from the radial and temporal arteries are of this kind. Compreſſion is ſometimes tried when the brachial artery has been wounded in phlebotomy. Here it is occaſionally tried in preference to the ligature, becauſe the latter cannot be employed without an operation to expoſe the artery. It is abſurd to adopt compreſſion, in this inſtance, with an idea that it effects a cloſure of the wound in the veſſel without obliterating its pervious ſtate; and conſequently that there is leſs chance of mortification from a deficiency of blood in the limb. Frequent diſſections have evinced,

evinced, that whenever a large artery has been wounded and healed by preſſure, the wound is never cloſed ſo as to leave the canal of the artery pervious.

When an artery of magnitude has received a ſmall wound, the following plan may be tried.

A tourniquet is to be applied ſo as to command the flow of blood into the veſſel. The edges of the external wound are next to be brought into contact. Then a compreſs, ſhaped like a blunt cone, and which is beſt formed by a ſeries of compreſſes, gradually increaſing in ſize, is to be placed with its apex exactly on the ſituation of the wound in the artery. This graduated compreſs, as it is termed, is then to be bound on the part with a roller.

Some ſurgeons alſo apply a longitudinal compreſs over the track of the veſſel above the wound; they do ſo with a view of weakening the current of blood into the veſſel. Whatever good effect it may have in this way, is more than counterbalanced by the difficulty which it muſt create to the circulation in the arm. If the graduated compreſs be properly arranged, an effuſion of blood cannot poſſibly happen; and the application of preſſure along the courſe of the artery muſt, at beſt, be deemed ſuperfluous.

After relaxing the tourniquet, if no blood eſcape from the artery, the ſurgeon ſhould feel the pulſe at the wriſt, in order to aſcertain that the compreſſion employed is not ſo powerful as to prevent the circulation entirely. The arm is to be kept perfectly quiet in a ſling; and in 48 hours, if no bleeding take place, there will be great reaſon to expect that the caſe will do well.

Compreſſion of large arteries is never commendable, except in ſuch a caſe as has been juſt mentioned, or when the wounded veſſel is capable of being firmly compreſſed againſt an adjoining bone. The compreſſes ſometimes ſlip off, or the bandages become ſlack, ſo as to give room for fatal hemorrhage. When this plan is employed, the tourniquet ſhould therefore always remain ſlackly on the limb, and ready to be inſtantaneouſly tightened. In this kind of treatment the external wound may heal, while the aperture in the artery remains uncloſed, and an aneuriſm is the conſequence. This particularly occurs when the preſſure is not ſufficiently powerful. When it is too great, mortification of the limb is liable to happen. Such are the objections to putting entire reliance upon compreſſion. Firſt Lines of the Practice of Surgery, chap. 13.

Tourniquet.—This famous inſtrument for ſtopping bleeding conſiſts of nothing more than a band, which is faſtened round the limb with a buckle, and tightened by means of a ſcrew. To the band is attached a ſmall pad, which is to be laid exactly over the courſe of the artery. Although Ambroſe Paré is ſaid not to have been ignorant of the advantage of making preſſure on the large arteries of a limb in the performance of amputations, yet this knowledge does not appear to have led him to the invention of any inſtrument calculated to execute that object. Morel is reputed to have been the firſt inventor of a tourniquet, about the year 1674. His inſtrument, however, was not the perfect kind of one now in uſe; it remained for Petit to deviſe a tourniquet upon the ſimple yet perfect plan which we at preſent meet with in practice. We ſhall not here dwell on the conſtruction of the inſtrument, as this ſubject will more properly belong to another place. (See TOURNIQUET.) Our preſent deſign is merely to ſay a few words concerning its uſes.

The invention of the tourniquet will ever be regarded by ſurgeons as one of the moſt important improvements in their profeſſion, and when we recollect how many lives it has undoubtedly been the means of ſaving, the event muſt appear highly intereſting to mankind in general. Before ſurgical practitioners were acquainted with the uſe of the tourniquet, thouſands of their patients muſt have bled to death under their hands, in conſequence of their not having any means by which they could at once put a temporary ſtop to the bleeding, until they had had time to take ſuch meaſures as would have a permanent effect in its ſuppreſſion. In this ſtate the art of ſurgery muſt have been truly defective. No great operation could be undertaken upon the limbs without ſeriouſly endangering the patient's life from loſs of blood; while the want of that kind of ſuccour, which the tourniquet affords, muſt have made a great many wounds fatal, which otherwiſe would not have been attended with the leaſt danger. With a tourniquet of the modern conſtruction, ſurgeons are eaſily able to reſtrain in a moment the effuſion of blood, when any large artery of the limbs is wounded. As the inſtrument encircles the whole member, it compreſſes the branches of the artery as well as the trunk. It has alſo this immenſe advantage over every other contrivance, that, when it is well put on, a ſingle turn, or even a half turn of the ſcrew, will anſwer either for letting the blood guſh out in a full ſtream, or for preventing it altogether from iſſuing out at all.

The tourniquet is uſually put upon a limb in the following manner. A ſmall linen compreſs is firſt placed exactly over the courſe of the artery, on which it is intended to make the preſſure of the pad of the inſtrument operate. The ſurgeon then takes the tourniquet, and, laying its pad preciſely over the little compreſs, which, as we have juſt ſtated, ſhould be placed accurately over the artery, he faſtens the band round the limb with the buckle. The requiſite degree of preſſure is then to be made by turning the ſcrew, ſo as to tighten the band. In this manner it muſt be obvious, circular preſſure is made upon the member; but yet that preſſure will be the greateſt where the compreſs and pad are ſituated, that is, upon the ſpot beneath which the trunk of the artery lies.

Although the tourniquet is always ranked among the principal means of ſtopping hemorrhage, and its claim to praiſe is very high, its operation is only of temporary duration, it being common to apply it merely until ſome permanent plan of checking the hemorrhage is put into practice. Thus, in amputations, it is put round the limb, in order that the patient may not loſe too much blood in the operation; and no ſooner is this completed than the modern ſurgeon always immediately proceeds to ſecure the bleeding veſſels with the ligature. The tourniquet is then quite looſened, and often taken away entirely, it having executed its office. We do not wiſh this opportunity to paſs without expreſſing our diſapprobation of the common plan of taking the tourniquet off the limb, after amputations of the thigh, and the operation of popliteal aneuriſms. We have heard of ſome inſtances in which patients have been deſtroyed or pitifully reduced by ſudden hemorrhage, which could not be ſtopped with proper expedition by reaſon of the tourniquet having been taken away. This inſtrument, after ſuch operations, ſhou'd always be left in a ſlack ſtate upon the limb, ready to be tightened in a moment, by any nurſe or attendant in caſe of neceſſity.

The tourniquet, beſides being only of temporary utility, is limited in its application, by being only adapted to the limbs.

The ordinary tourniquet, as we have deſcribed, makes preſſure upon every part of the circumference of the limb, compreſſing the branches as well as the trunks of the veſſels. As it does this, and alſo preſſes upon both arteries and veins, it is plain that ſuch an interruption muſt in this manner be created

created to the circulation of the blood in the limb, that, were the application of the inſtrument to be continued beyond a certain time, a mortification muſt be the inevitable conſequence. It is for this reaſon that ſurgeons only uſe it as a temporary means. We have to mention, however, that tourniquets have been deviſed which are intended for making preſſure upon only one point of the limb, that is to ſay, upon the ſituation of the artery. With theſe inſtruments the practitioner could prevent the blood from flowing into an aneuriſmal ſac as long as he pleaſed, or rather as long as the patient's feelings would allow him. A tourniquet of this ſort has been invented by Plenk, intended for healing by preſſure the wound of the brachial artery accidentally made in bleeding.

Highly as we, with moſt other ſurgical writers, have ſpoken of the tourniquet, it would not become us to conceal the fact, that objections have been made to its common employment in amputations, and that ſuch objections come from ſuch ſurgeons as Monro, Louis, and Deſault. It is obſerved, in the Encyclopedié Methodique, partie chirurgicale, art. Hemorrhagie, that, how uſeful ſoever the tourniquet may be, ſurgeons have learned to do without it, and, for ſome years paſt, practitioners of the firſt eminence have almoſt laid it aſide. Inſtead of it, they make an aſſiſtant preſs a pad againſt the artery with his hands, by which means, it is ſtated, the hemorrhage may be ſufficiently commanded in almoſt every inſtance. In amputations at the ſhoulder-joint, the influx of blood into the arm may eaſily be prevented, by making preſſure upon the ſubclavian artery as it paſſes over the firſt rib, with a compreſs or ſimply with the fingers. This, ſays the French writer, can be more conveniently done thus, than with a tourniquet. He adds, that wherever a tourniquet will command the flow of blood, an intelligent aſſiſtant, accuſtomed to the buſineſs, will ſtop the bleeding equally well with his hands; except perhaps in a few examples, where the artery is very deeply ſituated, as is the caſe with the femoral and popliteal arteries in fat ſubjects. The ſame author alſo quotes a caſe, recorded in the thirteenth volume of the Edinburgh Medical Commentaries, where, in an amputation of the thigh, the bone was ſawn through immediately below the little trochanter, and the artery was merely preſſed upon with the fingers.

This method, which was recommended many years ſince by the celebrated Monro, has been followed by various practitioners, and, in particular, by that diſtinguiſhed ſurgeon Deſault, who ſeldom uſed the tourniquet in his practice. The plan is repreſented as being more convenient to the operator, and leſs fatiguing to the patient. Diminiſhing the number of inſtruments in the operation, is alſo held forth as a reaſon for the method. M. Louis was rather an advocate for it, ſince he found, that in his mode of amputating, it was advantageous not to hinder the looſe muſcles from retracting as much as poſſible, as ſoon as they were cut through, by having any tight band applied round them at the time.

Notwithſtanding theſe objections and reaſons, we find all the beſt ſurgeons commonly uſing the tourniquet in amputations, and, as we think, with perfect propriety and prudence in the generality of caſes. In amputations at the ſhoulder, indeed, the tourniquet is awkward, and hardly admits of being applied; ſo that, in this caſe, it is common to make preſſure upon the ſubclavian artery, with a compreſs held down with ſome ſuch inſtrument as the handle of a key. We think, that in other amputations, with the exception of a few, ſo high up the thigh that the tourniquet cannot very well be uſed, without being in the operator's way, the employment of this inſtrument is highly prudent. It is true, the aſſiſtant can effectually ſtop the current of blood through the main artery; but, does he prevent the hemorrhage from the branches, which, by reaſon of the anaſtomoſes, bleed as profuſely as the trunk itſelf? How many patients, brought to the ſad dilemma of parting with a limb, for the ſake of having a chance of living, are incapable of bearing much loſs of blood? When the femoral artery is compreſſed by an aſſiſtant, what is to hinder that alarming and profuſe hemorrhage, which muſt ariſe from the branches of the arteria profunda, as well as from thoſe veſſels, which inoſculate freely with the large arteries, which emerge from the pelvis? Our ſentiments are entirely in favour of the common mode of proceeding.

Of the Ligature.—The plan of tying the mouth of a bleeding artery with a ligature ſeems, at firſt view, ſo exceedingly ſimple and obvious, and at the ſame time ſo likely to be effectual, that we ſhould be ſurpriſed at the delay attending its introduction into practice, were we not convinced, that it is the inſeparable fate of the medical profeſſion always to be retarded by the influence of baſe, intereſted, mercenary characters, by an obſtinate adherence to old errors, and the worſe effect of blind and obdurate prejudice. The ancients, undoubtedly, cannot be ſaid to have been totally unacquainted with the method of tying arteries, as ſome paſſages in the article ANEURISM, of this work will clearly prove. But they certainly did not derive much advantage from whatever knowledge they had upon the ſubject, ſince it did not prevent them from placing confidence in a multitude of inſignificant and pernicious drugs, which they were in the habit of commonly employing for the ſtoppage of bleedings. Neither did it urge them to relinquiſh the cuſtom of ſearing the fleſh with hot irons for the ſame object. Even in the time of Ambroſe Paré, who, in conſequence of the general oblivion, into which the ligature had fallen, is reputed to be its inventor, the greateſt oppoſition was made to its being uſed, and ſuch reſiſtance, (be it alſo remarked to their ſhame,) was made by men at the head of their profeſſion, and by the whole college of phyſicians in Paris, one of the moſt enlightened cities in the world. This unwillingneſs to uſe the ligature proceeded from the jealouſy and literary pride of the phyſicians of thoſe times. Delighted with the abſurd learning, which they cultivated and attached to their Greek, Roman, and Arabian maſters, they were worſhippers of the ancients, and of their doctrine of fire. They were intolerant and revengeful; they claimed to be the legitimate repreſentatives of the old ſchools; they would rather cauterize arteries with the ignorant and brutal Albucaſis, that Arabian farrier, than tie them with Paré, the firſt ſurgeon of Europe, their contemporary. See John Bell's Principles of Surgery, vol. i. p. 158.

Paré's vile opponents complained of its being "very forward, raſh, and preſumptuous, in a certain perſon, to venture upon condemning the cauterizing of bleeding veſſels, after cutting off a mortified limb, a method ſo highly and continually commended, and approved of by all the ancients; teaching in oppoſition to that, without any authority, without knowledge, without experience, without good ſenſe, ſome new method of his own, of tying arteries and veins."

As the ligature is now univerſally conſidered the beſt and moſt ſecure means of ſtopping every conſiderable hemorrhage, it is neceſſary to be rather particular in the account of it. We ſhall, therefore, now endeavour to explain ſome very intereſting facts upon the ſubject, which are related in Dr. Jones's excellent work.

This gentleman was informed by Dr. J. Thomſon, of Edinburgh, that in every inſtance in which a ligature is applied around an artery, without including the ſurrounding parts,

parts, the internal coat of the artery is torn through by it. Dr. Thomſon added, at the ſame time, with his uſual candour and liberality, that the fact had been firſt noticed by Monſieur Deſault. Dr. Thomſon alſo demonſtrated to Dr. Jones, on a portion of artery taken from the human ſubject, that the internal and middle coats are divided by the ligature.

This information led Dr. Jones to undertake a ſeries of experiments on the arteries of dogs and horſes, with a view of obtaining a further confirmation of theſe circumſtances, and additional light, reſpecting the changes, which happen to an artery, in conſequence of the application of a ligature to it. From ſuch experiments it was aſcertained, that the firſt effects of the ligature upon an artery are a complete diviſion of its internal and middle coats, an oppoſition of its wounded ſurfaces, and an obſtruction to the circulation of the blood through its canal. There is a ſmall quantity of blood at reſt juſt within the extremity of the artery, it therefore coagulates; but it does not appear in every inſtance to form at once a coagulum, capable of filling up the canal of the artery. Indeed, Dr. Jones expreſſes a ſuſpicion, that the end of the artery may yet undergo ſuch a degree of contraction, as may prevent the formation of a complete coagulum. However, the production of a coagulum in this inſtance, "is, according to Dr. Jones, of little conſequence; for ſoon after the application of the ligature, the extremity of the artery begins to inflame; and the wounded internal ſurface of its canal, being kept in cloſe contact by the ligature, adheres and converts this portion of the artery into an impervious, and at firſt ſlightly conical ſac. It ſeems to be entirely owing to the effuſion of lymph, by which this adheſion is affected, that the coagulum of blood, formed within the artery, is ſometimes found adhering by a ſmall part of its baſe to the extremity of the artery. But whilſt the adheſion of the internal parietes of the artery is accompliſhed, a conſiderable quantity of lymph is effuſed between its coats, and among the parts ſurrounding its extremity; ſo that in a very ſhort time, the extremity of the artery is enveloped in lymph, and covered with a layer of it, juſt as we have ſeen the punctured artery to be. After a ſhort time, the ligature occaſions ulceration of the part around which it is immediately applied; and acting as a tent, a ſmall aperture is formed in the layer of lymph effuſed over the artery; through this aperture a ſmall quantity of pus is diſcharged as long as the ligature remains; and finally, the ligature itſelf alſo eſcapes, and the little cavity, which it has occaſioned, granulates and fills up, and the external wound heals in the uſual manner; leaving a conſiderable thickening and induration of the cellular membrane, extending a little beyond the extremity of the artery." Jones on Hemorrhage, p. 162.

It is further to be obſerved, that when a collateral branch is very near the place where the ligature is applied, no coagulum is formed. The permanent changes alſo, which take place in an artery, and in the circulation through the limb, in conſequence of the ligature, are the ſame as thoſe which happen in conſequence of the diviſion of an artery. The portion of the arterial trunk which has been tied is gradually annihilated to the firſt collateral branches, while all the collateral branches begin to aſſume a larger ſize from the very moment the trunk is tied. Jones, p. 163.

The deſign of applying a ligature to an artery is to produce an immediate ſuſpenſion of the hemorrhage, and an adheſion of the internal and middle coats of the artery. The accompliſhment of the latter object affords the only laſting ſafety againſt a recurrence of the bleeding. Union, by the firſt intention, can in general only be obtained in clean and ſimple inciſed wounds. For this reaſon, Dr. Jones recommends us to take the utmoſt care to uſe the ligature of the form, and to apply it in the manner moſt conducive to the formation of ſuch a wound. This able writer has publiſhed ſome inſtructive conſiderations reſpecting the manner in which the ligature, by its improper form or application, may give riſe to ſecondary hemorrhage. He points out the common and blameable indifference of ſurgeons about the ſize and form of their ligatures, and the force uſed in tying the artery. "Some ſurgeons (ſays Dr. Jones) wiſhing to guard againſt the ligature's ſlipping off, tie it with very conſiderable force, while others, apprehenſive leſt they ſhould cut through the artery, or occaſion too early a ſeparation of the ligature, draw it only ſufficiently tight to prevent the eſcape of any blood. Now it appears highly improbable that a broad flat ligature ſhould make ſuch a wound in the internal and middle coats of the artery, as is moſt favourable to adheſion; becauſe it is ſcarcely poſſible to tie it ſmoothly around the artery, which is very likely to be thrown into folds or to be puckered by it, and, conſequently, to have an irregular bruiſed wound, made in its middle and internal coats. And, even if it ſhould make a proper wound, yet by covering a conſiderable ſpace of the external ſurface of the artery, it may deſtroy the very veſſels which paſs on it in their way to the cut ſurfaces of the internal and middle coats, and thereby render them incapable of inflaming; nor does it appear that anaſtomoſing branches can ſupply this defect: for if the branches which immediately ſupply the cut ſurfaces are bruiſed and compreſſed by the ligature, how is the blood from anaſtomoſing branches to enter them? But, admitting that ſuch a ligature makes a proper wound, and that the wound unites, ſtill it may cover that part of the external coat which is directly over the newly united part, and, conſequently, as ſoon as it has occaſioned ulceration through the external coat, it will produce the ſame effect on the newly united parts, and of courſe ſecondary hemorrhage." Jones, p. 167—169.

When the form of the ligature is irregular, the internal and middle coats of the artery will probably be cut through more completely at ſome parts than others. But Dr Jones's experiment proves, that, in order that ſuch an effuſion of lymph may happen as will produce adheſion, it is neceſſary that theſe coats be completely divided all round the artery. Hence he infers, that ſecondary hemorrhage will take place as ſoon as the ligature has ulcerated through any part of the parietes of the artery, and that it will be more copious and frequent as the ulceration advances.

If ſuch a ligature, or perhaps any ligature, is too ſlackly applied, for fear of cutting through the artery, or of a too ſpeedy ſeparation, the ſame thing will happen.

Dr. Jones, with much reaſon, ſhews the impropriety of applying a ligature round an artery, in ſuch a manner, that it is higher on one ſide than the other. When this is the caſe, the cut edges can neither be ſo juſtly placed, nor ſo firmly kept in oppoſition as they ought to be; they will therefore be more eaſily torn aſunder; and the ulceration produced by the ligature will be much more likely to affect the recently united parts, and produce hemorrhage. Jones, p. 171.

This judicious writer adviſes the employment of ligatures which are round and very firm. Theſe ſhould be tied with rather more than ſufficient tightneſs to cut through the internal and middle coats of the artery. By this means, the cut ſurfaces will be more certainly kept in contact; the coming away of the ligature will be expedited, and the riſk of the ulceration extending to the newly cicatrized part therefore leſſened. As the internal coats ſoon become adherent,

herent, there is no danger of the ligature making its way by ulceration through the external coat before that event is completed. See Jones, p. 172.

Since the arteries are themselves furnished with arteries from those which surround them, and since they can only be in a sound state, while they continue to receive a due supply of blood through the vasa vasorum, it must be evident, that, tying an artery in a place where it is completely detached from all its surrounding natural connections, must be particularly unfavourable. Such portion of the artery is not in a fit state for inflaming and throwing out the necessary quantity of coagulating lymph, by which adhesion and the permanent closure of the vessel are to be completed. Should it receive a partial supply of blood, in consequence of its connections not being totally destroyed, it will not be in a condition to bear inflammation, but will be likely to fall into a state of sloughing or ulceration, in such a degree, that secondary hemorrhage must ensue.

Hence, in compliance with the advice given by Mr. Abernethy in speaking of aneurism, the best English surgeons always make it a rule in practice to tie every large artery, as near as possible to the part of it which lies undisturbed among its natural connections.

However, practitioners ought to be particularly careful not to include any of the surrounding flesh in the ligature, as this method, besides being productive of severe agony, great sloughing of the surface of the wound, &c. tends to hinder that most desirable effect of the ligature, the division of the internal and middle coats of the artery.

Of course, when the vessel is under a certain size, the surgeon cannot avoid tying a small portion of flesh together with it; but still such portion ought to be as little as possible, in order that the patient may not be put to unnecessary pain, and that as much of the wound may heal by adhesion as circumstances will allow.

When the mouth of a cut artery is wide and very visible upon the surface of a wound, it is best to take hold of it with a pair of spring forceps, (see *Plate* II. *fig.* 11.) and tie it as nearly as possible to the part where it begins to be surrounded with flesh. However, nothing except the artery should be included in the ligature, neither nerve nor muscle. When the artery is of smaller size and less distinct, it cannot be so conveniently taken up with the forceps, and surgeons, for the purpose of tying it, usually raise it, together with a small portion of the flesh, by means of the tenaculum. (See *Plate* II. *fig.* 9.)

Surgeons should make it a maxim never to employ more ligatures than are essentially necessary for the removal of all risk of hemorrhage. Ligatures act as foreign bodies in wounds exciting irritation, preventing adhesion, and producing suppuration. In all recent wounds there are always many small arteries, which bleed at first for a few minutes; but which then spontaneously cease to pour forth any blood and give no farther trouble. Were a surgeon hastily to tie every vessel of this sort, he would rashly tie nearly the whole surface of the wound, the patient would be put to an unnecessary degree of excessive pain, and the wound, instead of healing by the first intention, would slough and suppurate to a very great extent. In hemorrhages, from the smaller order of arteries, compression ought rather to be trusted than the ligature used; because compression has a tendency, by keeping the opposite surfaces of the wound in contact, to promote adhesion, while the operation of the ligature, as an extraneous substance, is prejudicial in the manner already mentioned.

In consequence of cicatrization being hindered by the continuance of ligatures in wounds, it is always advantageous to take them away, as soon as they are loose enough for this purpose. The celerity with which ligatures become detached, is, generally speaking, in proportion to the small size of the tied vessels, and the little quantity of additional substance included with them in the ligature. From small arteries ligatures are often detached in three or four days; with such arteries as the radial and ulnar, the process frequently takes up a week; while, with vessels equal in size to the femoral, inguinal, and axillary arteries, the ligature generally remains firmly attached ten days or a fortnight. When it continues longer than usual, the surgeon should draw it very gently, at each time of applying the dressings, so as to accelerate the ulceration of the external coat of the artery, by which means the separation is effected. However, as Dr. Jones has explained, great caution is requisite in endeavouring to expedite this event. "We should always remember, (says he), that so long as the attachment of the ligature appears to have any degree of firmness, any force exerted on it, (as, for instance, by pulling it rather strongly,) must act more or less on the recently cicatrized extremity of the artery, which is not only contiguous to it, but is still in union with that portion of the artery which detains the ligature; for it is the external coat of the artery which hinders the separation of the ligature, partly in consequence of its undergoing ulcerations slowly, and partly because the ulceration which takes place in the first portion of the artery, by rendering the ligature loose, diminishes very much its power of promoting ulceration through the rest of the artery." Jones, p. 162.

Ligatures, in consequence of being applied in an improper and careless manner, have sometimes slipped off the end of the artery, and dangerous and fatal hemorrhages been the consequence. Some surgeons have endeavoured to avert all blame from themselves by imputing the accident to the violent impetus of the blood. Dr. Jones more accurately refers it to the clumsiness of the ligature, which prevents its lying compactly and securely round the artery; or to its not having been applied tight enough, lest it should cut through the coats of the artery too soon; or, finally, to its having that very insecure hold of the artery, which the deviation from the circular application must necessarily occasion. The impetus of the blood is immediately diminished by this fluid being determined into the collateral branches, as soon as the ligature is applied. Neither is there any pulsation for some way above the tied extremity of the vessel. The artery also, after its first retraction, undergoes only an inconsiderable and gradual change of this kind. Jones, p. 173.

The subject, just now noticed, is one deserving of some attention. Mr. Astley Cooper met with some instances in which the ligatures slipped suddenly off the end of the artery, in the operation for popliteal aneurism. This circumstance led him to adopt a plan, which is described by Dionis, and consists in passing the end of the ligature through the part of the artery below where the knot has been made, and then tying the two ends of the ligature together in an additional knot. Now, since this mechanical method of hindering the ligature from slipping is not needed, when the artery is tied upon the principles related by Dr. Jones, and since allowing a second knot to lie in the wound, upon the end of the artery, must increase irritation, and augment the risk of the ulceration destroying some of the recent adhesion of the internal and middle coats of the artery, we cannot refrain from expressing our aversion to the practice.

Ligatures always have a bad effect, in relation to the process by which the wound is healed, so that they should never be large nor more numerous than is absolutely useful. Large, clumsy

clumſy ligatures muſt be the leaſt calculated for cutting through the internal and middle coats of the artery, a thing which is ſo eſſential and deſirable.

Surgeons, after tying the bleeding arteries, in caſes of wounds, always cut off one end of each ligature, the other being ſufficient for the purpoſe of withdrawing it when looſe. In this way the quantity of extraneous ſubſtance is materially leſſened.

Every one who knows any thing at all about ſurgery, muſt have heard a great deal of the plan of ſtopping hemorrhage with the needle and ligature, which are paſſed through the fleſh on each ſide of the mouth of the bleeding artery, after which a knot is made and the needle cut off. We were ſorry to find Mr. John Bell ſo laviſh of praiſe upon the needle. When an artery is ſo expoſed that its mouth can be taken up with the forceps, or tenaculum, the ligature ſhould be put and tied round the end of the artery with the fingers. There is no occaſion whatever for piercing the patient's fleſh with the needle; nor can the practice of including the fleſh in this way in the ligature be at all juſtifiable upon any rational or really uſeful principle. We will not ſay, however, that there can never be a caſe, in which it is neceſſary to uſe a needle and ligature for the ſuppreſſion of hemorrhage. When it is deſirable to introduce a ligature cloſely under an artery, which has not been completely cut acroſs, and which has been ſufficiently brought into view, we agree that a needle may ſometimes be of advantage. But, even in ſuch inſtances, the ſharp points of the common needles are ſomewhat dangerous; ſo that the moſt prudent ſurgeons uſually employ an eye-probe, or an aneuriſm-needle for the purpoſe. The moſt approved aneuriſm-needle is repreſented in *Plate* II. *fig.* 10. All random thruſts into the fleſh with the needle and ligature, for the object of ſtopping an hemorrhage, muſt ever meet with the diſapprobation of a well-informed ſurgeon. The injury and pain, which are invariably occaſioned by ſuch practice, are quite unwarrantable; and the miſchief which may be done is of the moſt formidable and fatal deſcription. When a wounded artery is not ſufficiently expoſed to be tied, let the ſurgeon expoſe it by careful diſſection; but never venture to puſh a needle into the parts at random, with a view of getting the artery into the nooſe with the reſt of the fleſh.

With regard to the occurrence of ſecondary hemorrhage, in caſes of aneuriſm, Dr. Jones imputes the accident, when the operation has been performed by tying the artery once without dividing it, either to a diſeaſed ſtate of the artery; to contrivances for compreſſing a large portion of the veſſel; to placing a looſe ligature above that which is tied; or to tying the artery in too ſlack a manner, from a fear of producing too ſpeedy an ulceration of the veſſel. In conſequence of this laſt circumſtance, the ligature is not applied with ſufficient tightneſs to cut through the internal and middle coats ſo as to fit them for adheſion; but, on the contrary, occaſions a gradual ulceration through the coats of the artery, and, of courſe, hemorrhage, which returns with greater violence as the ulceration advances. The improper form and thickneſs of the ligature may alſo tend to the ſame bad conſequences. See Jones, p. 176.

The greater likelihood of ſecondary hemorrhage, when only one ligature is uſed in the operation for aneuriſm, inſtead of applying two and dividing the artery between them, is explained by Dr. Jones on the ſame principles as thoſe which were ſome years ago pointed out by Mr. Abernethy, in his obſervations on aneuriſm. When two ligatures are applied, and the artery cut through, "the artery is tied cloſe to the part at which its connection with the ſurrounding cellular membrane is complete." In the other mode, "a conſiderable portion of the artery is detached from the ſurrounding cellular membrane, and the ligature applied, perhaps, in the centre of this detached portion; or, even if it be applied at the upper end, ſtill there remains a conſiderable portion of detached artery below it; now, when we conſider that the arteries receive their veſſels from the ſurrounding cellular membrane, it muſt be evident, that if we deprive it of theſe veſſels, it cannot undergo thoſe changes which depend upon vaſcularity, *viz.* inflammation and adheſion; and, conſequently, the ligature cannot produce thoſe effects on which the ſucceſs of the operation depends; but the portion of artery dying, and burſting or ſloughing, hemorrhage takes place if the ligature be applied on the centre of the detached portion of the artery, when the artery gives way, the hemorrhage will proceed both from the upper and lower portions; but if it be applied on the veſſel at its connection with the ſurrounding cellular membrane, either above or below, the hemorrhage will then proceed from only one part of the artery, which will be that which has the detached portion of the artery for its extremity." Jones, p. 177.

There is another cauſe of ſecondary hemorrhage mentioned by this gentleman; it is the ſudden ſeparation, or laceration of the recently united parts of an artery by premature and extraordinary exertions of the patient. See p. 181.

Dr. Jones, in the courſe of his very intereſting experiments, aſcertained, that if a ligature be tied round an undivided artery, with ſufficient tightneſs to cut through its internal and middle coats, an obliteration of the canal of ſuch veſſel follows, though the ligature be untied and taken away, immediately after its application. This is a highly important fact in relation to the operation for aneuriſms, and ſeems likely to lead to a new practice. For if the continuance of a ligature in a wound is productive of irritation, and preventive of union by the firſt intention; if, alſo, ſecondary hemorrhage is ſometimes a conſequence of the ill form and bad application of the ligature: we have no heſitation in thinking, that the ſimple plan of juſt tying an artery with a thin round ligature, to cut through its internal and middle coat, and then taking it altogether away, promiſes to lead to conſiderable improvement. One of the chief objects to be attended to in ſuch an operation, would be to detach the artery no more from the ſurrounding parts, than is juſt ſufficient for the paſſage of the ligature under it.

In amputations, the nutrient artery of the bone ſometimes bleeds rather profuſely, and, in conſequence of its ſituation in a bony canal, cannot be tied. In this circumſtance, if the operator directs an aſſiſtant to preſs a little bit of lint on the bleeding aperture, during the time employed in ſecuring the reſt of the veſſels, the hemorrhage will in general have ceaſed, before it is time to cloſe the wound. Should it not have done ſo, the ſurgeon may immediately ſtop it by juſt introducing a ſmall plug of lint into the oriſice, from which the blood proceeds.

Sympathetic inflammatory fever is the conſequence of all conſiderable wounds, whether theſe be occaſioned by accidents, or operations. By ſuch febrile diſturbance, the action of the whole arterial ſyſtem is rendered more vehement. Hence during its predominance, the patient is particularly expoſed to the danger of freſh hemorrhage. The bleeding occaſioned by the impetuous motion of the blood, ariſes either from veſſels, which previouſly effuſed little or no blood, or from ſuch as did bleed before, but were not effectually ſecured.

In this caſe, if the patient be very plethoric, the performance

formance of veneſection may be proper, the loſs of venous blood being leſs hurtful to the conſtitution, than that of arterial. The flow of blood into the wounded limb is always to be decreaſed by placing the part (if poſſible) in an elevated poſture. Sometimes cold applications; in other inſtances, compreſſion may be tried. A tourniquet, ſo made and applied, that it would neither ſtop the circulation in too great a degree, nor hinder the return of blood through the veins, might be of much utility. When, however, notwithſtanding other means, the bleeding yet continues, the veſſels muſt be expoſed, and tied with a ligature. John Bell's Principles. Jones on the Proceſs employed by Nature in ſuppreſſing the Hemorrhage from divided and punctured Arteries, the Uſe of the Ligature, on ſecondary Hemorrhage, &c. 1805. Cooper's Practice of Surgery, chap. 13. edit. 2.

Hemorrhage, *Uterine*, is a profuſe diſcharge of blood from the uterus. See Flooding.

HEMORRHOIDALIS, in *Anatomy*, (from hæmorrhois, which is derived from αιμα, *blood*, and ῥοος, *flux*,) a name applied to ſome parts belonging to the inferior portion of the large inteſtine, ſuch as its arteries and veins. The internal hemorrhoidal artery is a branch of the inferior meſenteric; the external hemorrhoidal arteries come from the pudendal: the hemorrhoidal veins join the inferior meſenteric. See Artery and Vein.

HEMORRHOIDS, or Piles, denote varicoſe ſwellings originating about the anus, or termination of the rectum, and formed by a morbid dilatation and thickening of the veins, which belong to this inteſtine.

Hemorrhoids vary in number, ſize, ſhape, and ſituation; ſome are *external*, and others *internal*. In general they only occaſion a degree of inconvenience, which is very bearable; but, ſometimes, they give riſe to ſerious grievances, either by burſting and pouring out ſuch quantities of blood as reduce the patient to the loweſt ſtate of debility, and dangerouſly impair his health; or by exciting inflammation around them, and cauſing abſceſſes and fiſtulæ; or by becoming conſtricted by the ſphincter ani muſcle, ſo as to produce exceedingly acute pain; or, laſtly, by aſſuming a malignant character.

When theſe tumours are not in the habit of bleeding every now and then, they are denominated, by ſyſtematic writers, *blind* piles; when they occaſionally emit blood, they have the epithet of *open* applied to them.

It is a doctrine advanced by many reſpectable writers on ſurgery, that hemorrhoids, which are not very troubleſome, and diſcharge only moderate quantities of blood, are rather ſalutary, than hurtful to the conſtitution, and require no particular treatment. Sabatier obſerves, that there are ſome piles of ſmall ſize, which every now and then bleed; that ſuch periodical diſcharges afford great relief to the patient; and that the evacuations are almoſt as neceſſary to him as the menſes are with regard to the female ſex. He ſtates, that when the uſual bleeding is ſuppreſſed, the patient finds himſelf indiſpoſed, being troubled with laſſitude, heavineſs about the head, flatulence, lowneſs of ſpirits, &c. Of courſe, practitioners, who can bring their minds to believe, that the continuance of any diſcharge, not ordained by nature, is beneficial to the patient, will naturally think of taking ſome means to reproduce it when it is ſtopped. Some, in caſe the bleeding from piles is ſuppreſſed, direct leeches to be applied. M. J. L. Petit, however, acknowledges, that he never ſaw any benefit reſult from this plan, either becauſe the quantity of blood, thus taken away, is too inconſiderable, or becauſe it is not taken from the overdiſtended veſſels. On the contrary, it is urged againſt the method, that ſome inſtances of very profuſe hemorrhages have been the conſequence of it, the parts having returned within the rectum, and it not having been in the practitioner's power to make any effectual application to them.

M. J. L. Petit preferred puncturing one of the largeſt and moſt external of the tumours with a lancet, for which purpoſe, he uſed to make his patient ſit over the ſteam of ſome hot water till the hemorrhoids were ſufficiently ſwollen.

With reſpect to applying leeches to piles, its ſafety is now fully eſtabliſhed by the practice of every day; for, in this country, we may ſay, they are invariably employed for the relief of inflamed hemorrhoids, though never with the abſurd notion of taking away blood for the cure, or prevention, of complaints, fancied to proceed from the ſuppreſſion of the bleeding, from theſe tumours. Beſides, were an evacuation of blood neceſſary for the health of the conſtitution, veneſection in the arm would be a much more rational plan, as giving the practitioner an opportunity of taking away an effectual quantity from the circulation. Entertaining, as we do, a total diſbelief of the doctrine, that the bleeding from piles is ever really ſerviceable to the ſyſtem, we ſhall never attempt to re-produce a diſcharge of blood from them, when ſuch is ſuppreſſed; but, at the ſame time, ſince a perſon with piles may alſo have complaints, which require bleeding, we perceive no reaſon why, in ſuch caſes, any change ſhould be made in the common mode of taking away blood, or that veneſection in the arm ſhould be abandoned for the employment of leeches, or the lancet, in another part. We know, that it is approved as a general maxim, to take away blood as near as poſſible to the ſeat of a diſeaſe; and to this method we alſo give our decided approbation. It is for this reaſon, that we often preſcribe the application of leeches to the anus, in caſes of inflamed protruded hemorrhoids. But as we do not credit, that the ſtoppage of bleeding from piles is likely ever to prove a cauſe of any diſeaſes, but rather of an improvement of the health, we are far from being anxious to ſee the hemorrhage renewed in any form whatever. But ſuppoſing ſome illneſs were actually to be the effect of a ſuppreſſion of bleeding from the tumours, ſuch illneſs could only be imputed to a conſtitutional plethora, induced by the uſual evacuation of blood not taking place. Here the redundant and hurtful quantity of the circulating fluid might be much more conveniently and certainly drawn from the arm, in the common way, than by applying leeches to the tumours, or puncturing them with a lancet. The blood, in this circumſtance, is not taken away for the relief of the piles, but of ſome other affection, and, conſequently, the principle of bleeding, as near as poſſible to the ſeat of the diſeaſe, is not at all obſerved, as ſome may ſuppoſe it is, in drawing blood from the ſwellings themſelves.

Hemorrhoids, ſituated high up the rectum, are in general not ſo apt to be painful as when the ſwellings occupy a lower ſituation, where they are liable to be compreſſed by the ſphincter ani muſcle. Piles, which are far up the inteſtine, are ſurrounded by ſoft ſubſtances, and are not in danger of ſuffering any conſtriction, ſo that it often happens the patient has no ſuſpicion of the diſeaſe till he is alarmed by ſome great and ſudden bleeding from the anus.

However much piles may put on the appearance of being ſolid excreſcences, they are only dilatations of the hemorrhoidal veins, or mere varices. The diſtended parts of the veſſels are indeed thickened and indurated, while ſome of the adjacent cellular ſubſtance is harder than is natural. It is from theſe circumſtances that the ſwellings often ſeem more like firm fleſhy ſubſtances than hollow varices, likely to burſt and bleed in a troubleſome and dangerous manner. Piles are brought on by the ſame ſort of cauſes, which give riſe

to

to varicoſe tumours in other parts of the body. Whatever tends to obſtruct and retard the return of the blood through the hemorrhoidal veins is apt to bring on the diſeaſe; a ſedentary inert life is often productive of the complaint; inactivity and neglect of proper exerciſe, by being attended with a languid circulation in the venous ſyſtem, are common cauſes. It is for theſe reaſons that women are particularly often afflicted with piles. The frequency of the complaint in the female ſex is alſo greatly increaſed by the preſſure which the uterus makes on the trunks of the hemorrhoidal veins in the advanced ſtage of pregnancy. Inactivity frequently leads to coſtiveneſs, in which caſe the large inteſtines are apt to remain diſtended for days and days together with hard maſſes of excrement, which muſt have conſiderable effect in obſtructing the flow of blood through the ſurrounding veins, and conſequently in producing the diſeaſe. This may be another reaſon of the frequency of piles in women, and all perſons of ſedentary lives, or of a coſtive habit of body. We believe, alſo, that exceſs in drinking tends very much to the production of the complaint, probably by firſt occaſioning a coſtive ſtate of the bowels. The preſſure of an enlarged liver, or of the water, in caſes of dropſy, is repreſented by ſurgical writers as an occaſional cauſe of hemorrhoids. When piles originate from the preſſure made by the gravid uterus upon the hemorrhoidal veins, it is in vain to look for a cure before parturition; and after this has happened the interference of a ſurgeon is in general not required, as then a ſpontaneous cure uſually enſues. Nor can hemorrhoids be cured, when they ariſe from the preſſure of the water of aſcites, until the fluid is either got rid of by proper medicines, or by tapping the abdomen.

Perſons afflicted with piles ſhould, above all things, avoid coſtiveneſs. Gently laxative medicines, and an horizontal poſition of the body, generally diminiſh the uneaſineſs attendant on the diſeaſe; at the ſame time, a ſalve, made of elder ointment and the powder of oak-galls, in equal parts, may be applied to the tumours, together with linen wet with the lotio aquæ lithargyri acetati. This latter is more particularly neceſſary when the caſe is accompanied with conſiderable pain and inflammation, in which circumſtance leeches are highly proper. Theſe may be uſed without riſk of bringing on any dangerous degree of bleeding, as manifold experience has convinced us; and we cannot help conſidering the profuſe hemorrhage, which Petit mentions having ſeen follow their employment, as altogether uncommon, and undeſerving of ſerious apprehenſion. Some ſurgeons puncture hemorrhoidal ſwellings with a lancet, and the bleeding which is thus excited is generally followed by a ſubſidence of the pain attending certain ſtates of the diſeaſe. When piles are in a painful inflamed ſtate, it is a good plan, in ſome inſtances, to apply warm water to them by means of a bidet, or ſemicupium, conſiderable eaſe being frequently obtained in this manner. When the pain and inflammatory ſtate of piles is owing to their being conſtricted by the ſphincter ani muſcle, it is evident that the mode of relief conſiſts in puſhing the tumours with the finger a little within the rectum, where they are not liable to ſuffer from preſſure.

When the number and ſize of hemorrhoids are ſo conſiderable as materially to obſtruct the paſſage of the feces; when they are very painful, and ſubject to profuſe bleedings; when the patient is incapacitated by them from following his uſual occupations; and when palliative means are ineffectual, it is the duty of the ſurgeon to recommend the removal of the tumours.

We ſhall not detain the reader with deſcribing how former ſurgeons uſed to deſtroy piles with the actual and potential cautery, plans which now only excite horror, and ſerve to make us conſcious of the ſuperiority of modern over ancient ſurgery. Theſe barbarous methods have been very properly adandoned, the only means of extirpation now employed being the knife or ſciſſors, and the ligature, with which the ſwellings are either at once cut off, or tied ſo as to fall into a ſtate of mortification.

The common method of removing piles with a knife or pair of ſciſſors, has nothing peculiar in it, the tumours being ſimply cut through at their baſes. With reſpect to ſciſſors, we have to obſerve, that though they are not apt to do any material harm in the preſent caſe, yet it is better not to employ them, but always accuſtom ourſelves to that more truly ſurgical inſtrument the knife. If we uſe ſciſſors in one inſtance, where a little contuſion is not of much conſequence, we ſhall perhaps contract a habit of uſing them on other occaſions, where incalculable miſchief may be the effect of the inciſion not being cleanly performed. Some ſurgical writers, among whom is Sabatier, adviſe us to ſave the ſkin covering the hemorrhoids. We are recommended to raiſe it with a pair of diſſecting forceps, and then ſeparate it from the tumours with a knife, without cutting it away. The piles are next to be removed. The preſervation of the ſkin is repreſented as being of great conſequence; for any bleeding which may occur may now be more eaſily ſtopped; and when there are ſeveral hemorrhoids to be extirpated, the loſs of ſubſtance about the anus will be leſs, and of courſe the patient will not be ſo liable to a contraction of this part, which has ſometimes proved a laſting grievance through life.

Some hemorrhoids are only viſible juſt after the patient has been at ſtool. We need ſcarcely remark, that in ſuch caſes the practitioner is obliged to take this opportunity of performing the operation.

Reſpecting the extirpation of piles with a knife, and their deſtruction with a ligature, Mr. Ware obſerves, that theſe operations, though leſs dreadful than thoſe which have been relinquiſhed, are ſtill formidable in no ſmall degree. The former, if the tumours are large, makes a round of conſiderable extent, and riſks a hemorrhage, which has ſometimes been very difficult to ſuppreſs. The latter brings on a ſevere pain, which has continued many days, before the portions that are included within the ligatures have ſeparated and come away.

Before a recourſe is had to either of theſe operations, Mr. Ware thinks that it may be of uſe to recollect, that though the number of hemorrhoidal tumours protruded through the anus is often conſiderable, yet the pain which the patient ſuffers is not produced equally by all of theſe. If an accurate enquiry be made, he believes it will be found that the patient will point to one, or at moſt to two of the tumours, from which all the pain proceeds. When theſe are examined it will be diſcovered that they are much harder, and more inflamed than the reſt; and that, generally, they are alſo ſmaller and leſs prominent, protruding but juſt low enough to be compreſſed by the ſphincter ani muſcle.

Suppoſing this account to be accurate, it follows that the operation of cutting off the whole number of hemorrhoids with a knife or ſciſſors, and that of tying a ligature around them, in order to cauſe them to die and fall off, are both equally unneceſſary. Inſtead of having recourſe to theſe proceedings, we ſhould, according to Mr. Ware, only direct our attention to the hard inflamed tumour which is the cauſe of the pain, and which is not unfrequently ſituated in the centre of the reſt. This is often no larger than the end of the little finger, and the removal of it almoſt inſtantly abates the pain, and in a ſhort time cauſes the reſt of the tumours to collapſe and diſappear. The mode in which this gentleman has performed the

the operation, in a great variety of cafes, is fimply this: Having fecured the little hard tumour, which is often fituated near the centre of the reft, and much darker coloured than they are, with a common diffecting hook, or forceps, he fnips it off, as clofe to its bafis as poffible, with a fharp pair of curved fciffors. The pain which the operation occafions is repref ented as really trifling; and the hemorrhage which follows is fo flight, that he has rarely found any neceffity to do any thing to ftop it. In cafes in which the pain has not been violent, but a conftant diftreffing uneafinefs has been felt, with frequent returns of a profufe hemorrhage, which fometimes weakens the patient in an extreme degree, an operation fimilar to what has juft been defcribed, will, fays Mr. Ware, not unfrequently be fufficient, in an eafy manner, to effect a radical cure of the diforder. In cafes of this defcription, as well as in thofe before mentioned, a careful inquiry will often difcover that one, or at moft two, of the hemorrhoids are alone productive of thefe effects, and alone require removal, the excitement and protrufion of the reft being merely the effect of the irritability which thefe occafion. See Ware on the Treatment of Hemorrhoids.

Without pretending to pronounce any decifion refpecting the efficacy of Mr. Ware's plan, we are inclined to entertain a favourable opinion of it, becaufe it is undoubtedly lefs fevere than the common method of removing all the tumours, and even in cafe of failure no harm is done, as the reft of the troublefome fwellings may now be extirpated. The patient, in this circumftance, firft has the chance of being cured by a mild operation; fuppofing he does not obtain the defired degree of relief, the removal of the reft of the fwellings will in all probability procure it for him; and the pain of the two operations will not be greater than what would have been fuffered, had all the tumours been cut away at once. However, with our averfion to the employment of fciffors for dividing parts of the human body, we cannot refrain from again repeating our advice to ufe a fcalpel.

With regard to tying hemorrhoids, it is eligible when thefe fwellings are fituated high up the rectum, where the danger of bleeding is fomewhat alarming; but, as the common means of deftroying piles, we give it our decided reprobation. It is always a tedious plan, feveral days often paffing before the tumours drop off; it is alfo lefs cleanly, and attended with much more pain, than what is occafioned by the knife. Petit was led to give up the mode of curing hemorrhoids with a ligature on account of a very ferious circumftance; after its application, in one or two inftances, fuch fymptoms, as are brought on by a ftrangulated hernia, took place, with dangerous and fatal confequences.

Hemorrhoids are frequently the cauf e of a prolapfus ani, which is excited by the irritation of thofe fwellings, and ufually difappears on the original difeafe being removed.

Whenever the bleeding, after the removal of any hemorrhoidal tumour, is troublefome, profufe, or dangerous, the furgeon muft diftend the rectum with a piece of fponge of fuch fize as will make the requifite degree of preffure upon the opening of the bleeding veffel. Some furgeons would alfo dip the fponge in fome ftyptic lotion, though, perhaps, the beft way would be to introduce that fubftance quite dry into the inteftine, and let it expand there with the blood which would be imbibed by it. With this plan, it is right, at the fame time, to apply linen wet with cold water to the nates. Every practitioner fhould know how to proceed in this fort of cafe, as the hemorrhage has been known to prove fatal, the rectum and whole of the colon being found filled and diftended with blood on infpecting the body after death.

HEMP, in *Botany*. See CANNABIS.

HEMP, in *Agriculture*, a well known fibrous-rooted plant of the herbaceous fort, which rifes to a confiderable height with a thick ftrong ftem, efpecially where the ground is favourable to its growth. It affords a rind or coat, the texture of which is firm and ftrong, being held in high eftimation in the manufacture of the more coarfe forts of cloth, ropes, and different defcriptions of cordage, as well as a number of other articles.

There is a great variety of other plants, both of our own growth and that of other countries, which yield a ftrong fibrous covering, but none, that have yet been difcovered, which are in any degree equal to this in the forming of the feveral articles that have been juft noticed. It is, of courfe, a matter of much regret, that the growth of a plant of fuch utility and importance fhould not be more attended to in this country, where there is fo much land well fuited to its cultivation.

Soil.—The nature of the foil moft adapted to the raifing of hemp crops, is chiefly that of the more deep black putrid vegetable texture, which has a fomewhat low fituation, with fome degree of inclination to moifture. But they fucceed tolerably on the deep mellow, loamy, and fandy defcriptions. The great difference is, that on the former fort there is generally a more abundant produce; but which fome fuppofe of a lefs valuable quality. They are alfo capable of being grown on foils of an inferior quality, where proper care and attention are beftowed in their culture.

In entering upon the cultivation of this fort of crop, it is neceffary for the farmer to have regard to feveral different matters; fuch, for inftance, as the convenience of markets for the difpofal of the produce; the capability of providing fufficient fupplies of fuitable manure; the diminution it will caufe in the extent of neceffary green crops for the ufe of live ftock; and its being of a nature to contribute little to the increafe of the dung-heap; as well as to the great trouble and attention which it requires in being prepared for the market, &c.

Preparation.—It is neceffary, in preparing land for this kind of crop, that it fhould be brought into a fine mellow condition, and be perfectly freed from all forts of weeds, by the frequent operation of the plough and harrow. Thefe are ufually accompliffhed where it is put in after grain crops, by having recourfe to three ploughings and an equal number of harrowings; the firft being performed as foon as poffible after the preceding crop is removed, the fecond as early as it can be done in the fpring; and the laft, immediately before the feed is fown. Some, however, give four ploughings, and as many operations of the harrow; or two ploughings, with a fufficient number of fcufflings, having the furface ultimately harrowed down quite fine, and left in broad flat ridges.

It is ufual in the ploughing, immediately before the feed is put in, to apply well rotted farm-yard dung in the quantity of twenty-one-horfe cart loads, or good rich compoft in the proportion of thirty-three, as without fuch dreffings good crops can feldom be procured.

In the growth of this kind of crop in Scotland, they manure the land well with the beft dung; and after the feed is put in, top-drefs with afhes, and the dung of fheep, pigeons, &c.

Seed.—It is of much importance, in the culture of this fort of crop, to have fuch feed as is perfectly freth and good, which is beft afcertained by its weight and the brightnefs of its colour.

The quantity of feed muft neceffarily vary under different circumftances; but from two to three bufhels are the quantities moft ufually employed. Too much feed fhould, however, never be given, as much injury is conftantly done where the plants are too clofe and thick upon the ground. Where the

ſowing is executed in the drill manner, a much ſmaller quantity of ſeed may be ſufficient.

Sowing.—This is, in the greateſt number of caſes, performed in the broadcaſt manner, being diſperſed over the ſurface of the prepared ground as evenly as poſſible, and then covered in by means of light harrowing.

Where drilling is had recourſe to, which is ſuppoſed to have the advantange of more completely promoting the early growth of the plants, eſpecially where ſeed is the object, the rows ſhould be formed as near together as the ſhares of the machine will admit.

The proper time of ſowing this kind of crop, is when the danger of the ſpring froſts is over, as when put into the ſoil too early, it may be greatly injured by them, and when kept out to a late period, it may be much damaged in that way. The beſt ſeaſon on the drier ſorts of land is, without doubt, as ſoon as poſſible after the froſts in the month of April, while in thoſe of a more moiſt quality, it is the moſt ſafe way to delay it to a later period, always chooſing a medium ſtate of dryneſs in the mould of the ſoil for the execution of the buſineſs. The ſeed ſhould, however, never be kept out of the ſoil a moment when the ſeaſon is ſuitable, as various advantages attend the early ſowing of this crop, ſuch as the ſuperior vigour of its early growth, and its withſtanding the different after operations practiſed upon it in a better and more effectual manner. It is, however, to be remembered, that the plant is of a rather tender nature.

This is a kind of crop that is capable of being grown after moſt other ſorts, and even on land broken up from the ſtate of ſward, in a perfect manner by the uſe of the ſkim-coulter plough. And it has been grown on the ſame ſpot of ground for a great number of years, without the intervention of any other ſort. In Suffolk this has been the caſe for ſeventy years in ſucceſſion, but with the almoſt conſtant uſe of manure to prevent the exhauſtion it would otherwiſe produce. And in other diſtricts the ſame is the caſe.

It is conſtantly neceſſary, when the ſeed of the hemp plant has been ſown, to uſe much caution in keeping the birds from the ground, as they otherwiſe devour a large proportion of it in a very ſhort time.

After-Culture—But little attention is neceſſary in the management of this crop after the ſeed has been depoſited in the ground, the tall growth and thick ſhade of the plants, from the nature of their foliage, ſoon covering the ſurface, ſo as to prevent the riſing of every ſort of field weed.

In caſes where the drill machine is employed in putting in crops of this nature, it is ſometimes the practice to give them a hoeing or two in their more early growth.

It is neceſſary to obſerve farther, that in the culture of this ſort of field-crop, there ſhould be a mixture of the male and female, or *ſemble* hemp plants, in order to the obtaining the moſt complete ſucceſs. The latter is the ſort that yields the ſeed, the former affording merely flowers.

Pulling.—When the crop is become perfectly ripe, which is known by its putting on a whitiſh yellow colour, and the ſtems beginning to ſhed their leaves, it is time to pull it; but the male ſort of hemp frequently becomes ripe ſome weeks before that of the female.

They are in general both leſs injured by being pulled at too early a period than too late, or when they are not too fully ripened. And at the time one part is pulled, it is neceſſary to be cautious that as little damage as poſſible be done to the other. When the land is in narrow ridges or in drills, there will be little danger of its being injured as the ſide-furrows or intervals will give ſufficient room to thoſe who are engaged in the work of pulling.

In ſome diſtricts both kinds of the hemp plants are pulled together, while in others they are ſeparated, and the laſt is ſuppoſed the beſt practice where it can be adopted, as by pulling a large portion of the crop before it is properly ripened, the amount of the produce muſt not only be conſiderably diminiſhed, but its quality be much impaired in reſpect to its durability.

The work of pulling is performed by forcing it up by the roots from the ground in ſmall portions at a time, by means of the hand, ſhaking off the mould well from them before the parcels are depoſited upon the ſurface. The buſineſs is commonly executed in a little more than three months from the time of putting in the crop. The expence of the work varies greatly in different ſituations and circumſtances.

In ſome it formerly amounted to the large ſum of 18*s.* or 20*s.* the acre; while in others it is performed in an equally good manner for not more than 11 or 12*s.* But at preſent the expence of the labour ſtands conſiderably higher.

As ſoon as the labour of pulling is finiſhed, the hemp is tied up into ſmall bundles, or what are commonly denominated *baits*.

Seeding.—Where crops of this nature are deſigned for the purpoſe of affording ſeed, they muſt of neceſſity ſtand until the ſeed becomes perfectly ripened, which is readily ſhewn by the appearance of the plants. The ſtems are then pulled up and bound into rather large bundles; which are ſet up in nearly the ſame way as thoſe of green, until the ſeed becomes ſo firm and dry as to ſhed in a free manner: it is then either immediately threſhed out on large cloths for the purpoſe, ſpread out upon the field, or preſerved in ſmall ſtacks, to be afterwards performed at the farmer's convenience. In the buſineſs of pulling, much care is required to prevent the ſeed from being loſt. The ſeed of the hemp may be rendered much more fine, hard, and ſlippery by ſuffering it to ſtand out in the ſtooks in the field for ſome days when the weather is fine, and, in order to prevent any inconvenience in the watering of the ſtem parts, the ſeed-pods may be chopped off with a knife for the purpoſe, and be afterwards dried upon ſome ſort of cloth, being fully expoſed to the influence of the air in ſome ſort of ſhed or other ſimilar place. By this means the danger of injuring the hemp by threſhing out the ſeed, as well as by ſun-burning, rain, and the loſs of the colour, may in a great meaſure be avoided.

Preparation of the Hemp.—In rendering the rind or bark of the hemp-plant proper for the uſes of the manufacturer, it is neceſſary for it to undergo a variety of other proceſſes.

Retting.—This is performed in two different methods, either by means of the dew or the uſe of water. The former is denominatted *dew-retting*, the latter *water-retting*, which affords much the fineſt hemp. Both theſe proceſſes are ſaid to anſwer the moſt perfectly when the weather is inclined to be ſhowery while they are going on. In the dew-retting method, the hemp-ſtalks are, immediately after being pulled, ſpread out in a thin, even, and regular way, ſo as to keep exact rows on a fine piece of cloſe, old, ſward land, which is pretty even on the ſurface, for the ſpace of three, ſix, or even eight weeks, according to circumſtances, being turned as often as may be neceſſary in the time. In ſhowery ſeaſons, this is moſtly done three times in the week, while in other circumſtances, twice is in general as much as is requiſite.

As ſoon as the rind or barky portion of the hemp-plant becomes eaſily ſeparable from the firm part of the ſtem or

bun, it is taken up from the ground, and tied up into rather large bundles, in order to be carried home and ſtacked up, or placed in ſome covered building till it is wanted for being formed into hemp.

This proceſs is denominated *graſſing*, and in its execution requires great nicety and attention, in order to prevent the texture of the hemp from being deteriorated by too long a continuance on the ſward, or by removing it at too early a period before the hempy ſubſtance has been rendered ſufficiently ſeparable.

In the water-retting method, which is much more common and ſpeedy, the hemp, after being wholly taken up, and bound into rather ſmall bundles, by means of bands at each end, is carried in general to a pond of ſtanding water; ſuch pits as have clayey bottoms being moſtly preferred, being there depoſited bundle upon bundle, in a direct and croſſing manner, ſo as to form what is generally called a *bed* of hemp. When it has been piled to ſuch a thickneſs as the depth of the water will admit, which ſome ſuppoſe can hardly be of too great a depth, though five or ſix feet are the moſt uſual depths, the whole maſs is loaded with large pieces of heavy wood, until it is completely immerſed. When it has remained in this ſtate for five or ſix days or more, according to the nature of the pond and the weather, it is taken out and conveyed to a piece of mown graſs, or other ſward-land, that is perfectly clean and free from all ſorts of animals. There the bundles are untied, and the hemp-ſtalks are ſpread out thin, ſtem by ſtem. While in this ſtate, eſpecially in moiſt weather, it muſt be carefully turned every ſecond day, to prevent being injured by the worm caſts. It is continued in this way for five or ſix weeks or more, when it is gathered up, tied in large bundles, and kept perfectly dry in a houſe or ſmall ſtack, till wanted for uſe.

In ſome of the northern parts of Scotland, where, after the hemp is pulled, and the leaves, ſeeds, and branches removed by means of a ripple, it is formed into bundles of twelve handfuls each, and ſteeped ſix days or more in the manner of flax. It is known when it has had ſufficient watering by the reed being readily capable of parting from the bark. But it is favourable that it ſhould rather have too much than too little time. The moſt ſlender hemp ſtands in need of the greateſt length of time in the water. Where the quantity of hemp is only ſmall, the hempy part may be ſeparated from the reed by hand labour; but where it is large, drying and breaking it in the manner of flax is the beſt method. See FLAX.

The hemp, after being taken out of the water, is not here ſpread out upon graſs-ground in the way of flax, but dried as quickly as poſſible, by ſetting it in an inclining poſition, againſt cords faſtened up for the purpoſe, or in any other way that will afford it the full benefit of the air, until it is completely dry, and riſes in bliſters from the boon. As ſoon as it has been reeded, it ſhould be cleared from the mucilaginous material which it contains, by pouring water upon it and repeatedly ſqueezing it, being careful not to let the fibres be entangled together, as by that means waſte is incurred.

Monſ. Bralle on the continent, has however ſuggeſted a very different method to any of theſe, for the purpoſe of ſteeping hemp, the advantages of which, it is aſſerted, have been fully proved by numerous trials. The proceſs conſiſts in heating water in a veſſel or vat to the temperature of from 72 to 75 degrees of Reaumur, diſſolving in it a quantity of green ſoap, in the proportion of 1 to 48 of the hemp. The body of water made uſe of in this intention, ſhould be about forty times the weight of the hemp. When this is prepared, the hemp ſhould be thrown into it, in a manner ſo as to float upon the ſurface, the veſſel being immediately covered, and the fire put out. The hemp ſhould continue in this ſtate for about two hours, when it will be found to be fully ſteeped.

The principal ſuperiority of this method is ſuppoſed to conſiſt, beſides a great ſaving of time and expence, in the ſame quantity of hemp affording more tow. The value of the fuel as well as the time employed in the proceſs, ſhould however be well conſidered in ſuch caſes. It is likewiſe believed to promote the cultivation of hemp crops, by the facility which it affords to its preparation, even in ſuch ſituations as are not contiguous to rivers, ſtreams, or ponds, as well as to obviate any ill conſequences that might poſſibly originate from the putrid effluvia of the atmoſphere, and the corruption of the waters induced by it, which laſt are well known to deſtroy the fiſh contained in them, as well as to prove hurtful to cattle that drink of them.

Where hemp is left for ſeed, and not water-retted, in conſequence of the great trouble and expence of the proceſs, though it is unqueſtionably the beſt way to always have it performed, it is commonly ſtacked up and well covered for the winter ſeaſon, in order that it may be thinly ſpread out about January or in the following month. Where this can be executed during the period of a ſnow, the hemp comes much more readily to a good colour, and forms ſtrong coarſe cloths, but is far inferior to that pulled in due ſeaſon, and which undergoes the water-retting operation as noticed above.

Various contrivances have been made, in the form of ponds and pits, for the ſteeping of hemp, but one which ſeems to poſſeſs much merit, is deſcribed in the Norfolk Report as the invention of Mr. Rainbeard, by which the hemp "is depoſited in the pit without the neceſſity of a ſingle perſon being wet. The pond is an old marle-pit with a regular ſlope from one ſide, (where the hemp is prepared,) to the depth of eight feet on the other ſide; on the ſlope above the water, the hemp is built into a ſquare ſtack, upon a frame of timber of ſuch a height, as will float and bear a man without wetting his feet; this is ſlid down upon the frame into the water, and when floating drawn away; a perſon on the oppoſite bank drawing the floating ſtack to the ſpot where it is to be ſunk, and on which it is built to the requiſite weight." The inventor "finds it does ſooneſt at bottom, and would not object to ſixteen feet of water. By means of this very uſeful contrivance he can put in a waggon load in an hour." The ſheaves are taken out one by one in the uſual manner; but it is ſuggeſted that ſome more expeditious and ſimple contrivance is here requiſite for effecting the purpoſe, either on the principle of the lever or ſome other.

In preparing hemp for the tool denominated the *heckle*, the work is chiefly executed by the *beetle*, and by firſt having recourſe to a coarſe, and then a finer brake. But the labour is capable of being more expeditiouſly performed by the rollers of a lint-mill. In either mode ſhaking the handfuls frequently with ſmartneſs is particularly neceſſary. In caſes where it happens that the hemp has not been ſufficiently watered, hand-peeling becomes neceſſary.

There is another method in uſe, which is that of the hemp-mill, much uſed by the Americans. It conſiſts ſimply of a large heavy ſtone in the form of a ſugar loaf, having the ſmall end cut off. Thus ſhaped, it readily moves round in a circle, when paſſing upon a plane. It is impelled by the power of a water-mill, when the hemp being depoſited upon the receiving floor, it becomes perfectly cruſhed and broken by the weight of the ſtone in its different revolutions.

The fluted rollers of the lint-mill are however without doubt

doubt the beſt means of performing the work, provided ſufficient care be taken to guard againſt accidents while it is going on.

As ſoon as the hemp has been completely broken, another operation becomes neceſſary, which is uſually denominated *ſwingling*, or ſcutching, the intention of which is to ſeparate the reed from the hemp.

This is executed chiefly in two different methods. The firſt is by the labourer taking a handful of hemp in his left hand, and while holding it over the ſharp edge of a board, ſtriking it with the fine edge of a long flat ſtraight piece of wood, uſually termed a ſwingle hand, or ſcutcher. This method is, however, both laborious and tedious in its performance; of courſe others have been had recourſe to, ſuch as mills moved by water, having a number of ſcutches fixed upon the ſame axle-tree, and which move with great velocity. The work is in this caſe executed with great expedition and far leſs fatigue to the workmen, but there is a great waſte of hemp, in conſequence of the prodigious velocity by which the mill is moved.

Before the hemp, prepared in this manner, is ſubjected to the heckle, it moſtly undergoes another proceſs which is termed *beetling*; by which the fibres of the hemp become more looſened and divided. The beetles employed in this intention are moved either by the power of the hand or that of water, which is by much the beſt.

Produce.—The quantity of produce in crops of this nature is extremely various according to the goodneſs of the land, and that of the cultivation which is beſtowed upon it. In ſome diſtricts, as that of Suffolk and ſome others, it is ſaid frequently to riſe to forty-five or fifty ſtones, and ſometimes more upon the acre; while in others, it often does not exceed twenty-five. It has been ſtated that the average crops of this kind, when prepared for the heckle, are from thirty-eight to forty ſtones of fourteen pounds each. And that the expence is commonly from about 7*s.* 6*d.* to 8*s.* or 9*s.* the ſtone, excluſive of the bounty allowed by government, which not unfrequently comes to 15 or 20*s.* more the acre. In the county of Norfolk the average crop is about 40 ſtones, and the price about 12*s.* the ſtone water-retted; and 9*s.* dew-retted. The uſual prices for ſeven years were 6*s.* dew-retted, and 8*s.* water-retted. In Scotland the produce and prices are nearly the ſame as in the above county.

In ſtanding for ſeed, the quantity is generally eleven or twelve buſhels the acre, and the prices commonly from 4*s.* to 6*s.* the buſhel.

However, though the expences of the cultivation of hemp crops are very conſiderable, on account of the ſoil, labour, and trouble which they require, the value which they afford in the produce, moſtly repays thoſe who engage in raiſing them in a pretty ample manner.

It has indeed been ſuggeſted by the writer of one of the Northern Reports, that this will prove a profitable crop to the farmer, who has greatly the advantage over the importer of foreign hemp, which, over and above freight and riſk, is liable to a heavy duty, as that of 2*l.* 4*s.* per cwt. when dreſſed, and 3*l.* for ſuch as is undreſſed. But the chief advantage of this ſort of crop is conceived to be that of its capability of being brought to many times the value of the original raw material.

It has been ſtated that the moſt beneficial time for the cultivator to diſpoſe of crops of this deſcription, is while they remain upon the land, juſt before the ſeaſon of pulling them, as in this way he wholly avoids the great trouble and uncertain expence of the ſeveral operations which are neceſſary in preparing them for the market, as well as the interruption which they are apt to throw in the way of other ſorts of work.

It cannot be doubted, from what has been ſtated above, but that hemp may be grown in many diſtricts of this country with great profit and advantage; and that the extenſion of its cultivation would be of vaſt national benefit. This cannot however be accompliſhed while the price of wheat keeps up to its preſent height, unleſs proper encouragement were given by means of bounties. But if this were the caſe, it would, in all probability, be much had recourſe to, as it is found to afford an excellent preparation for wheat crops. This would unqueſtionably take place, if ſuch encouragements were held out for any ſuitable length of time. In places where its cultivation is carried on to the greateſt extent, it has been confeſſedly found of much utility to the poor, in furniſhing them with full and conſtant employment. And in all ſituations where there is much neceſſity for ſail-cloth, cordage, netting, &c. its culture would be of vaſt benefit, if duly encouraged in preventing the money which is paid for theſe articles from going out of the country.

The neceſſity of attending more fully to the culture of hemp crops in this kingdom, is indeed rendered more imperious by the increaſing difficulty of obtaining foreign ſupplies, as well as by the inſufficiency of the various ſubſtitutes which have been adopted.

It does not appear that the ancients were acquainted with the uſe of hemp, in reſpect of the thread it affords. Pliny, who ſpeaks of the plant in his Natural Hiſtory, lib. xx. cap. 23, ſays not a word of this; contenting himſelf with extolling the virtues of its ſtem, leaves, and root. In effect, what ſome writers of the Roman antiquities remark, *viz.* that the hemp neceſſary for the uſe of war was all ſtored up in two cities of the weſtern empire; *viz.* at Ravenna and Vienne, under the direction of two procurators, called *procuratores linificii*, muſt be underſtood of linum, or flax.

HEMPFIELD, in *Geography*, the name of two townſhips of America, in Pennſylvania, one in Lancaſter county, and the other in that of Weſtmoreland.

HEMSKIRK, Egbert, in *Biography*, a painter, who exhibited much frolic of fancy in the ſubjects he choſe for his pencil, and vigour of execution in the completion of his pictures. He was born at Haerlem in 1645, and was a diſciple of Peter Grebber, whoſe manner he left for that of Brouwer.

In his own time his compoſitions caught the attention of the public, and were much eſteemed becauſe of their humour, and the whimſical imagination that reigned in them; but they are not now ſo much prized. His delight was in painting fanciful, wild, and uncommon ſcenes of his own compoſing; ſuch as the nocturnal intercourſe of witches, devils, and ſpectres; enchantments, temptations of St. Anthony, interiors of ale-houſes with drunken men, monkies in the actions of men and women, &c. &c. all which he wrought with great freedom of touch and intelligence of drawing. His colour likewiſe, though not always pure, was, in general, rich and agreeable.

He quitted his own country to ſettle in London, where he died in 1704. It was cuſtomary with him to paint his own portrait in his drolls, and which was not of the moſt

engaging kind; and he wrought by means of a looking glaſs his characters from his own face.

There were two other Hemſkirks painters, one Martin Hemſkirk, who painted ſerious hiſtorical pictures of no great merit, and Egbert Hemſkirk, called, by diſtinction, the Old, who painted ſubjects of the like kind with more ſucceſs.

HEMSON, in *Geography*, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 62° 43'. E. long. 17° 49'.

HEMSTERIUS, Tiberius, in *Biography*, was born at Groningen in the year 1685, where he received the early parts of his education, and from which place he removed to Leyden, for the purpoſe of ſtudying under the celebrated Perizonius. In 1705, he became profeſſor of mathematics at Amſterdam, an office which he reſigned in 1717, on being choſen Greek profeſſor at Franeker, to which, in 1738, was added the chair of hiſtory. In 1740 he quitted this place for ſimilar duties at Leyden, where he died in the year 1766. His firſt publication was an edition of the three laſt books of the Onomaſticon of Julius Pollux, which was publiſhed in 1706, when he was a very young man. On this occaſion he received a complimentary letter from Bentley, which, though at firſt it overwhelmed the youthful critic, and made him ſo ſenſible of his inferiority as to induce a reſolution never to appear again before the public, yet in a ſhort time he felt differently on the ſubject, and was anxious to emulate the powers of the man which he ſo greatly admired. His other publications were "Select Dialogues, and the Timon of Lucian." The "Plutus of Ariſtophanes with the Scholia and Notes." "Notes and Emendations on Xenophon Epheſius," inſerted in the Miſcellanea Critica of Amſterdam; "Obſervations on Chryſoſtom's Homily on the Epiſtle of Philemon," and many other pieces; particularly an edition of ſome parts of Lucian, in three volumes 4to. He was accounted an excellent critic, as well from the extent of his learning, as for his ſagacity in applying it. He was author of "Inaugural Speeches," and "Letters to Geſner and others."

HEMYNPOUR, in *Geography*, a town of Hindooſtan, in the circar of Gohud; 14 miles S.E. of Calpy.

HEN, in *Ornithology*, the female of the Phasianus *gallus*, which ſee. For the difference between the cock and hen, ſee Cock; and for the varieties of both, ſee Phasianus. In the choice of hens for domeſtic uſe, they ſhould be carefully ſelected, if we would have a genuine race; but if we want to vary and improve the ſpecies, the breed muſt be croſſed. To this purpoſe Columella expreſsly ſays, that the beſt poultry is produced by the union of a cock of a foreign family with the ordinary hens; and we find in Athenæus, that this idea was improved, a cock pheaſant being given to the common hens. In every caſe we ought to chuſe thoſe hens which have a lively eye, a flowing red comb, and no ſpurs. The proportions of their body are, in general, more ſlender than the males; yet their feathers are broader, and their legs ſhorter. Sagacious farmers, it is ſaid, prefer black hens, becauſe they are more prolific than the white, and more eaſily eſcape the piercing ſight of the birds of rapine, which hover near the farm-yard. Young hens lay moſt eggs; but old ones are the beſt ſetters. (See Fowl.) Hens need not the embrace of the cock to procure eggs; theſe are continually detached from the bunch in the ovarium, which grows independently of the union with the male. But theſe eggs, even when they acquire maturity, are mere organized bodies, ſuſceptible of a kind of life, but not a living animal ſimilar to the mother, and in its turn capable of continuing the race. This requires the union of the male, and intimate mixture of the ſeminal liquor of both ſexes; but when this has taken place, its effects are durable. Some hens lay eggs that have no ſhell; theſe never produce chickens; this happens, it is ſaid, to hens that are too fat. The oppoſite circumſtances occaſion the eggs to have too thick ſhells, or even double ſhells. (See Egg.) Hens lay through the whole year, except the time of moulting, which generally laſts ſix weeks or two months, about the end of autumn, or beginning of winter. The ordinary fecundity of hens is limited to the laying of an egg each day. There are ſome, we are told, in Samogitia, Malacca, and other places, that lay twice a-day. Ariſtotle mentions certain hens of Illyria, which laid ſo often as thrice a-day; and theſe were probably the ſame with the Adriatic hens, mentioned by him in another place, which were noted for their prolific quality. Some ſay that hens derive this prodigious fecundity from a peculiar mode of feeding; and, therefore, it is adviſed by ſome, in order to render hens productive in eggs, that they ſhould be well kept with ſome ſort of grain, or ſeeds, in which view, in addition to barley, buck-wheat and hemp-ſeed have been particularly recommended. The giving them a little animal food, and even fiſh, has alſo been ſuppoſed to make them lay at an early period. Heat is alſo very favourable; inſomuch that hens can be brought to lay in winter, by keeping them in a ſtable that has always warm dung on which they can ſit. (See Hatching and Incubation.) It is ſeldom that a hen clutches a brood of chickens more than once in a ſeaſon. The number of eggs laid in a year by the domeſtic hen are above 200; provided that ſhe be well fed and ſupplied with water. Her neſt, if left to herſelf, requires little previous preparation; and, warned by natural inſtinct, ſhe gives notice of the proper time for hatching by a low clucking note, and by ceaſing to lay. This clucking-ſeaſon is ſometimes artificially protracted, and ſometimes altogether ſet aſide by thoſe who derive greater profits from the eggs than from the chickens. Accordingly, the hen is ſtinted in her proviſions, and ſometimes, to the hazard of her life, plunged in cold water. If the hen be left to herſelf, ſhe would ſeldom lay more than 20 eggs in the ſame neſt, without attempting to hatch them; but if her eggs are removed, ſhe continues to lay, in order to increaſe their number. In the wild ſtate the hen ſeldom lays more than 15 eggs. When ſhe begins to ſit, her perſeverance and patience are very remarkable; ſhe continues for ſome days immoveable; and when hunger forces her away from the neſt, ſhe quickly returns. While ſhe ſits, ſhe carefully turns her eggs, and even removes them to different ſituations, till at length, in about three weeks, the young brood give ſigns of burſting their confinement. When they have broken with their bills a paſſage for themſelves through the ſhell, the hen continues to ſit till they are excluded. When all are produced, the ſtrongeſt taking the lead, and the weakeſt following, ſhe leads them forth to provide for themſelves, and in various ways ſeek the food that is neceſſary to ſupply their wants She recals them when they wander, ſpreads her wings over them to defend them againſt the inclemency of the weather, and broods a ſecond time. In theſe expreſſions of anxiety and attention, her own health is viſibly impaired, and ſhe may be diſtinguiſhed from every other hen by her ruffled feathers, and her trailing wings. The hoarſeneſs of her voice, and its different inflections, are all expreſſive of her ſituation, and of her maternal affection and ſolicitude. For their preſervation ſhe neglects herſelf, and expoſes her life to danger in their defence. Whatever the enemy be that aſſails them, ſhe warns them by her repeated cries, and boldly attacks the foe, whilſt her brood are driven into

into ſome place of ſecurity. The number of chickens which a good hen can rear and clutch at a time is about 10 or 12; but this bears a ſmall proportion to the number of eggs ſhe lays; and, therefore, recourſe has been had to artificial methods of hatching in aid of her own efforts. See HATCHING. See alſo CHICKENS, FOWL, and POULTRY.

HEN, *Guinea.* See NUMIDIA *Meleagris.*

HEN *and Chickens,* in *Geography*, a cluſter of ſmall iſlands in the South Pacific ocean, near the coaſt of New Zealand; one of them is high, and terminates in two peaks. S. lat. 35° 53'. W. long 180° 1'.—Alſo, a group of ſmall iſlands in the Eaſt Indian ſea. S. lat. 5° 30'. E. long. 118° 3'.

HENAO, GARIEL DE, in *Biography*, was born in 1611. He entered, when he was about 15 years of age, into the order of the Jeſuits at Salamanca, and ſpent the greateſt part of his life in that univerſity. After he had been long in the habit of teaching philoſophy and ſcholaſtic theology, he was admitted to the degree of doctor of divinity, and appointed rector of the univerſity. He obtained a very high reputation by the ſolutions which he gave to perſons who came from all parts to conſult him in caſes of conſcience. He lived to the great age of ninety-three, and continued to perform the duties of profeſſor till within three years of that time. His works conſiſt of eleven folio volumes, all written in the Latin language. Nine of them are compoſed of treatiſes on philoſophical, theological, and controverſial ſubjects; the others are devoted to an account of the antiquities of Biſcay, and furniſh the reader with much curious and intereſting matter; they are entitled "Biſcaya Illuſtrata." He was author of many ſmaller pieces not inſerted in this collection. Moreri.

HENAULT, CHARLES JOHN-FRANCIS, the ſon of a farmer-general, was born at Paris in 1685, and acquired, at an early age, a taſte for elegant literature. In 1707 he obtained the prize of the French Academy by a poem, and in 1715 he produced a tragedy, which met with ill ſucceſs, but was printed, in 1768, by Mr. Walpole, at Strawberry-hill. He became an aſſociate of the French Academy in 1723, and about the ſame time was received into the Academy of Inſcriptions, and other learned ſocieties. He was appointed honorary preſident of the inqueſts in parliament, and ſuperintendant of the finances of the queen's houſhold; but as an author, the work by which he is beſt known is his "Abregè Chronologique de l'Hiſtoire de France," 1768, in two volumes 4to. This is an excellent abridgment of all that is moſt intereſting and important in French hiſtory; in which the leading facts are thrown into a tabular form; the portraits of the moſt celebrated perſons are drawn, and ſhort diſſertations occur on ſeveral important hiſtorical topics. It has been tranſlated into ſeveral languages, and has ſerved as a model for other national hiſtories of a ſimilar kind; and is even now the beſt guide that can be followed in French hiſtory and chronology. He publiſhed in the ſame year two volumes of his miſcellaneous works, including academical harangues, ſome comedies, and other dramatic pieces. He died at Paris in 1770.

HENAULT, JOHN, a French poet, who flouriſhed in the 17th century, was the ſon of a baker at Paris, and travelled into the Low Countries and England. Upon his return, he was introduced to the munificent Foucquet, who patronized him on account of the excellence of his poems, which he at that period preſented to the public. On the fall of the miniſter, Henault compoſed a ſevere ſatirical ſonnet againſt his enemy and ſucceſſor, Colbert. This he would afterwards have gladly ſuppreſſed, but it was gone forth to the public much approved as a party piece, and could not be called in. He publiſhed a collection of poems in 1670, of which, one was a ſonnet, "On an Abortion," occaſioned by an accident which befel a young lady of rank. This excited an extraordinary degree of public attention, and for a time occupied all Paris with the diſcuſſion of its merits. Henault was addicted to the Epicurean philoſophy, and was rather eager in propagating his ſentiments. He went to Holland for the ſake of converſing with Spinoſa, but on the ſubject of religion Henault knew but little, and on the approach of death, he was probably alarmed at the future, and ſubmitted himſelf to his confeſſor, by whoſe advice he burnt part of his tranſlation of Lucretius, which, according to the opinion of Voltaire, judging from the part that remained, would have given him much celebrity. He died in 1682, and his printed works conſiſt of ſonnets, of letters, and of an imitation of two acts of the Troas of Seneca. Bayle. Gen. Biog.

HENBANE, in *Botany.* See HYOSCYAMUS.

HENBANE, in the *Materia Medica.* This plant, which is a native of England, and grows commonly amongſt rubbiſh, about villages, road-ſides, &c. and flowers in June, has been uſed medicinally; but the adminiſtration of it requires great caution. It has a ſtrong peculiar ſmell, and the leaves, when bruiſed, emit ſomewhat of the odour of tobacco. The odour is ſtronger when the leaves are burnt; and on burning they ſparkle with a deflagration, reſembling that of nitre, but to the taſte they are mild and mucilaginous. Henbane is a powerful narcotic poiſon; and different authors have mentioned ſeveral inſtances of its deleterious effects; whence it appears that any part of the plant, when taken in ſufficient quantity, is capable of producing very dangerous and terrible ſymptoms. The *roots*, which are biennial, long, compact, white, and beſet with many fibres, have been eaten by nine perſons, ſome of whom were ſpeechleſs, and ſhewed no other ſigns of life than by convulſions, contortions of their limbs, and the riſus ſardonicus; ſome had their eyes ſtarting out of their heads, and their mouths drawn backwards on both ſides; others of them had all the ſymptoms alike; but five of them did now and then open their mouths merely to utter howlings. On their recovery, all objects appeared to them as red as ſcarlet, for two or three days. The roots of the common henbane are uſed for anodyne necklaces, to hang about children's necks, in order to prevent fits, and cauſe them to breed their teeth eaſily; but this ſeems to be merely a vulgar application of them. Sir Hans Sloane gives an account in the Philoſophical Tranſactions (N 430, or vol. 38. p. 99.) of ſome children who, eating the ſeeds of the common henbane, were affected with intenſe thirſt, ravings, dimneſs of ſight, and a profound ſleep, which in one of them laſted two days and nights.

Theſe were all recovered by bleeding, bliſtering, purging, and vomiting. What ſir Hans obſerves particularly of the caſe is, that the delirium which was occaſioned by theſe ſeeds was not of the common kind, but was of the nature of that produced by the datura, a ſpecies of ſtramonium, and by the bangue of the Eaſt Indies, which is a plant with leaves like hemp.

The virtues of this ſeed may compenſate for the miſchief it may do when taken in an improper manner; in the tooth-ache, nothing is perhaps equal to it. Sir Hans Sloane mentions an account of a quack who cured this pain immediately by burning theſe ſeeds, and cauſing the vapour to be received into the tooth through a funnel. The empiric ſlily contrived to have ſome ſmall maggots conveyed at the ſame time into a pail of water placed under the perſon's head, which he pretended to have fallen out of the tooth, by the virtues of the medicine; but theſe being bred up to their

change, became ſmall beetles, and were doubtleſs of the common kind.

The *leaves* of the hyoſcyamus, we are told, were boiled in broth, and eaten by ſeven perſons, who ſoon became affected with ſymptoms of intoxication. About three hours afterwards, three of theſe perſons were become quite inſenſible, did not know their comrades, talked incoherently, and were in as high a delirium as people in the rage of a fever. All of them had low irregular pulſes, ſlavered and frequently changed colour; their eyes looked fiery, and they caught at whatever lay next them, calling out that it was going to fall. Phil. Tranſ. vol. xlvii. ann. 1750.

Henbane is poiſonous to birds and dogs; but horſes, cows, goats, and ſwine are not affected by it. Nevertheleſs, this plant, under proper management, may be ſafely employed, and in many caſes may be found an active and uſeful remedy. It was known to the ancients, and its anodyne effects were experienced by Dioſcorides, and it ſeems to have been uſed internally and externally by ſubſequent writers, particularly by Celſus; and in hemorrhagic diſeaſes the ſeeds were ſucceſsfully given by Plater, Foreſtus, and Boyle. It was, however, for a long time diſuſed, till baron Stoerck publiſhed ſeveral caſes of different diſeaſes, in which an extract, prepared from the juice of this plant, has been diſcovered to be an efficacious remedy. Theſe diſeaſes, as the baron ſtates them, are internal ſpaſms and convulſions, palpitation of the heart, madneſs, melancholy, epilepſy, inveterate head-aches, hæmoptyſis, and a troubleſome cough, accompanying the laſt-mentioned complaint. The ſucceſs in theſe caſes is confirmed by Collin, who extended the doſe of the extract to 24 or 30 grains a day. But from the experiments of Greeding, who tried it in 40 caſes of melancholia, mania, and epilepſia, the reſult was very different: it appears, however, to be an uſeful anodyne; and as it uſually opens the body, it may be advantageouſly ſubſtituted for opium, where the aſtringency of the latter becomes an objection to its uſe. Dr. Cullen is of opinion, that in epilepſy and various convulſive affections, the extract of henbane has no great virtue, different from or ſuperior to that of opium. Dr. Withering found it beneficial in a caſe of difficult deglutition. Stoerck and ſome others recommend the extract in the doſe of one grain or two; but Dr. Cullen obſerves, that he ſeldom diſcovered its anodyne effects till he had proceeded to doſes of eight or ten grains, and ſometimes to 15 and even to 20. The leaves are ſaid to have been applied externally with advantage in the way of poultice, for reſolving ſchirrous tumours, and for removing ſome pains of the rheumatic and arthritic kind. Woodw. Med. Bot.

Henbane, *Yellow*. See Nicotiana and Tobacco.

Henbane-*louſe*, in *Natural Hiſtory*, a name given by ſome to a peculiar inſect found very frequently on that plant in the ſummer months. It is one of the cimices of authors, and is very well deſcribed by Lifter in the Philoſophical Tranſactions. It is a very large cimex, of a fine red, ſpotted with black. It feeds on the juices of the henbane, whoſe leaves and ſtalks it pierces with its trunk. It is very remarkable that the juices of this ſtinking plant become of a very agreeable and aromatic flavour in the body of this inſect; and on trial it may perhaps be found, that the miſchievous narcotic quality of the plant may be rendered wholeſome, and a good medicine, in the body of this inſect. Phil. Tranſ. N° 71.

In June and July it is common to ſee ſeveral ſeries of oblong orange-coloured bodies adhering to the upper ſides of the leaves of this plant; theſe are the eggs of this cimex. Theſe eggs are white in the belly of the inſect, and whitiſh when laid firſt; but they grow more deep coloured when the young ones come near the time of hatching. They are hatched into perfect cimices, not into worms. Theſe eggs yield a colour, which is ſo fine, that it may be worth introducing into uſe in ſome manner; it is a fine lively carnation. There needs no more to obtain it, but the rubbing or cruſhing the eggs, while freſh, upon white paper. The inſects themſelves are ſo common, that from May to the end of June it is ſcarce poſſible to find a plant without them: and the eggs are not leſs frequent in their ſeaſon, in hot weather. They are ſometimes laid in May, but never later than June; their colour is apt to fade of itſelf; but this might probably be much aſſiſted as to holding, by alum, or other additions.

HENBIT, in *Botany*. See Lamium.

HENDA, in *Geography*. See Handa.

HENDAYE, a town of France, in the department of the Lower Pyrenées, at the mouth of the river Bidaſſoa, oppoſite to Fontarabia.

HENDECAGON, Endecagon, or *Undecagon*, compounded of ἑνδεκα, *eleven*, and γωνια, *angle*, in *Geometry*, a figure which has eleven ſides, and as many angles. If each ſide of this figure be 1, its area will be equal to 9.3656399 = $\frac{11}{4}$ tang. 73 $\frac{7}{11}$°, radius being 1. (See Polygon.) For the method of conſtructing a regular hendecagon on a given line, ſee alſo Polygon.

Hendecagon, in *Fortification*, is uſed for a place defended by eleven baſtions.

HENDECASYLLABUM, Ἑνδεκασύλλαβον, compounded of ἑνδεκα, *eleven*, and συλλαβη, *ſyllable*; of συλλαμβανω, *I comprehend*, in Greek and Latin *Poetry*, a verſe of eleven ſyllables.

Sapphic and Phaleucic verſes are, *hendecaſyllaba*, or *hendecaſyllabic*. *E. gr.*

Sap. Jam ſatis terris nivis atque diræ.
Phal. Paſſer mortuus eſt meæ puellæ.

HEND-DEIRE, in *Geography*, a town of Perſia, in the province of Irak; 50 miles S.W. of Com.

HENDERSON, Alexander, in *Biography*, a Scotch preſbyterian divine, who, on account of his great learning and impreſſive eloquence, was ſent to England as plenipotentiary. When Charles I. was at Newcaſtle in 1646, he engaged in a diſpute with him about epiſcopacy, in which Henderſon was overcome. This diſgrace, it is ſaid, haſtened his end, and before his death he expreſſed much concern at the part he had taken againſt the king.

Henderson, in *Geography*, the chief town of Montgomery county, North Carolina, ſeated at the confluence of the Yadkin and Huarry rivers, which form the Great Pedee: its court-houſe is 35 miles from Saliſbury.

Henderson's *Grant*, a tract of land 12 miles ſquare on the peninſula formed by the junction of Geeen river with the Ohio, in the ſtate of Kentucky.

Henderson, a county of Kentucky, including the greater part of the above grant, and containing 1263 inhabitants, of whom 340 are ſlaves.—Alſo, a poſt-town of the above county; 786 miles from Waſhington.

HENDERSON-TOWN, a poſt-town of Montgomery county, in North Carolina; 455 miles from Waſhington.

HENDERSON-VILLE, a poſt-town of Nottoway county, Virginia; 204 miles from Waſhington.—Alſo, a poſt-town of Sumner county, Teneſſee; 720 miles from Waſhington.

HENDON, a pariſh and village in the hundred of Goare, and county of Middleſex, England, is ſeven miles north of London, and contained, in the year 1800, 373 houſes, inhabited

habited by 1955 perſons. This village is widely diſperſed, and its various detached cluſters of houſes are deſignated by different names. The pariſh contains 8204 acres of land, of which about 300 are arable, 120 woodland, and the remainder meadow and paſture. In this village the abbot of Weſtminſter formerly had a palace, and poſſeſſed a manor here. The church is a large building, and contains ſeveral monuments, ſome of which commemorate perſons of eminence. One, with an effigy in white marble, is raiſed to the memory of ſir William Rawlinſon, knt., one of the commiſſioners of the great ſeal, in the time of king William and queen Mary. Near this is another for Edward Fowler, biſhop of Glouceſter, who died Auguſt 26th, 1714. Charles Johnſon, a dramatic writer of ſome eminence, was buried here March 18th, 1743. In the church is an ancient ſquare font, ornamented with the architectural details, &c. peculiar to the Norman era. In this village are an alms-houſe, and two charity ſchools. In the vicinity of Hendon are ſeveral pleaſant and handſome ſeats and villas. At Mill-hill the late Peter Collinſon formed and planted a botanical garden. Hendon-place, belonging to George Snow, eſq. is a fine ſeat. In Brent-ſtreet, near the church, is the ancient manſion of the Whithcotes, now the property and reſidence of John Cornwell, eſq. Lyſons's Environs of London, vol. iii. quarto.

HENDOOA, a circar of Bengal, bounded on the N. by Boglipour, on the E. by Rajemel and Pultanabad, on the S. by Birboom, and on the W. by Curruckpour; about 36 miles long and 22 broad; the chief town is Noony.

HENDOOABAD, a town of Hindooſtan, in Allahabad; 21 miles N.N.W. of Jionpour.

HENDU-KESH, a town of Grand Bucharia; 65 miles N.E. of Bamian.

HENEAGO Island, one of the Bahama iſlands, about 40 miles long, and from five to ten broad. N. lat. 21° 5'. W. long. 73°.

Heneago *Key*, a ſmall iſland among the Bahamas. N. lat. 21° 40'. W. long. 72° 46'.

HENED-Penny, in our *Old Writers*, a cuſtomary payment of money inſtead of hens, at Chriſtmas. It is mentioned in a charter of king Edward III. Mon. Angl. tom. ii. p. 327. Du-Cange is of opinion it may be hen-penny, *gallinagium*, or a compoſition for eggs; but Cowel thinks it is miſprinted *hened-penny*, for *heved-penny*, or *head-penny*.

HENFLING's *Temperament of the Muſical Scale*. In the Memoirs of the Academy of Sciences at Paris for 1711, 16mo. edition, pp. 406 and 416, M. Sauveur gives an account of the diviſion of the octave into 50 equal parts by M. Henfling, to form a tempered ſyſtem, of which the mean tone is eight and the major limma is five of theſe parts: the temperaments of the different intervals being ſhewn in eptemerids and logarithms in M. Sauveur's table, p. 416 as above. Dr. Robert Smith alſo, at page 156 of his "Harmonics," gives the temperaments of this ſyſtem (forgetting, however, to mention M. Henfling) and ſhews, that it agrees indefinitely near with his ſyſtem of equal harmony, in three octaves. The tenth and eleventh ſcholia to Mr. Farey's muſical theorems, in the Philoſophical Magazine, vol. xxxvi. p. 50, ſhew, that the fifths in this ſyſtem are each flattened 3 04811 ſchiſmas, and by theſe theorems, or the corollaries at p. 374, all the other temperaments and the wolves can be readily calculated

HENG, in *Geography*, a city of China, of the ſecond rank, in the province of Quang-ſi. N. lat. 22 36. E. long. 108 35'.

HENGIST, in *Biography*, the firſt Saxon chief who obtained a ſettlement in Britain, was ſaid to be a deſcendant of Woden, whom the Saxons worſhipped as a god. Hengiſt was in high eſtimation among his countrymen, the inhabitants of the Northern coaſt of Germany, on account of his great valour. When the Britons, wearied with, and unable to reſiſt the incurſions of the Picts and Scots, ſent a ſupplicant embaſſy to implore the aid of the Saxons, Hengiſt and his brother Horſa accepted the invitation, and in 449 brought over an army of ſixteen hundred men, whom they diſembarked in the iſle of Thanet. They were afterwards joined by five thouſand more of their countrymen, and not only defeated the common enemy with great ſlaughter, but determined to eſtabliſh themſelves in the country which they came to defend. They ſhortly after found means to quarrel with the Britons about their promiſed rewards, and commenced open hoſtilities againſt them. Vortigern, a weak and vicious king, was depoſed by his Britiſh ſubjects, and his ſon Vortimer placed at their head. Under his command many battles were fought between the Britons and the Saxons, in which the latter, under Hengiſt, committed the moſt cruel devaſtations, till he became entire maſter of Kent, of which diſtrict, including Middleſex, Eſſex, and part of Surry, he took the title of king, about eight years after his firſt arrival The conquerors conſiſted chiefly of three tribes, the Saxons, Angles, and Jutes, who paſſed under one common appellation, ſometimes of Saxons, ſometimes of Angles, and ſpeaking the ſame language, and being governed by the ſame inſtitutions, they were led, as well from theſe cauſes as from their common intereſt, to unite themſelves againſt the ancient inhabitants. Hengiſt made Canterbury the ſeat of royalty, where he died in 488, tranſmitting his newly acquired dominions to his ſons. Hume.

HENG-TCHEOU, in *Geography*, a city of China, of the firſt rank, in the province of Hou-quang, ſituated on the river Heng, which runs into a lake, called Tong-ting. The principal manufacture is that of paper. Near it are mines of ſilver, not allowed to be wrought. N. lat. 26 56. E. long. 112°.

HEN-HARRIER, in *Ornithology*. See Falco *Cyaneus*.

HEN-HOUSE, a place or building for confining or ſheltering poultry.

HENIDA, in *Geography*, a town of Perſia, in the province of Irak; 40 miles S.W. of Gnerden.

HENIOCHAS, Ἡνίοχος, *Auriga*, in *Aſtronomy*, a northern conſtellation. See Auriga.

HENIOCHI, in *Ancient Geography*, a people of Sarmatia, who inhabited the northern coaſt of the Euxine ſea. According to Ammianus Marcellinus, they trace their deſcent from two conductors of the chariots of the Dioſcuri, who had founded the town of Dioſcurias in this place. Theſe people were much addicted to piracy.

HENLEY, John, in *Biography*, known by the name of "Orator Henley," was ſon of a clergyman at Melton Mowbray, in Leiceſterſhire, where he was born in 1692. He was educated partly at the free-ſchool of his native town, and partly at Okeham, in Rutlandſhire. When he was about 17 years of age he was entered of St. John's college, in the univerſity of Cambridge. While he was under-graduate he ſent a letter to the Spectator, which was publiſhed as the 396th number of that work. After he was admitted to the degree of B. A., he undertook the care of a ſchool at Melton Mowbray, which he raiſed from a very low to a flouriſhing condition. Here he obtained a curacy, and acquired celebrity as a preacher. Flattered by his friends, he began to conceive himſelf adapted to ſome more important ſphere of action, and under this perſuaſion he reſigned his

ſchool

school and curacy, and determined to try his fortune in the metropolis. Here he was much followed as a preacher, and was frequently engaged in pleading the cause of charity. He published a translation of "Pliny's Epistles:" of some of the works of the abbé Vertot, of "Montfaucon's Italian Travels," and other works. He looked for preferment in the church, and had been promised it; but all his hopes being disappointed, he opened a chapel of his own, and attracted crowded audiences, but his manners were light and trifling, and aiming at nothing but popularity, he acquired no respectability, and was in a short time followed only by the very lowest orders of the people, to whom the vulgarity and licentiousness of his addresses were suited. He removed to a hired room near Lincoln's-inn Fields, where he practised the most miserable tricks to collect money. He died in the year 1756.

HENLEY-*upon-Thames*, in *Geography*, a market town and parish in the hundred of Benfield, and county of Oxford, England, is situated on the banks of the river Thames, at the base of some high grounds, which follow the course of that river. Dr. Plot calls it "the ancientest town in the county," but he has neither adduced fact nor argument to support his conjecture. This name he derives from *Hen*, signifying old, and *Ley*, a place. In an inspeximus granted by queen Elizabeth to the corporation of Henley, it is called Hanlegauz, and Hanneburg. By charter the town is incorporated, and governed by a high-steward, recorder, mayor, 10 aldermen, and 26 burgesses. Here are a weekly market on Thursdays, and four annual fairs. The malting business is the chief trade of the place; and is a source of profit and employ to many persons. Over the Thames, at this place, is a handsome stone bridge, the key stones in the centre arch of which were sculptured by the honourable Mrs. Damer. Near the bridge is a spacious church, with a square tower, mostly of flint. In the town are three free-schools, and other charitable endowments. The petty sessions are held here. In the year 1800 the town consisted of 635 houses, and 2948 inhabitants.

About one mile from the town is Park-Place, the seat of the earl of Malmsbury. The grounds are finely adorned with hanging woods; and in a field adjoining the park is an ancient and very curious Druidical temple, which the late general Conway caused to be brought from the isle of Jersey. The stones have been placed in the same relative positions as they were originally found.

HENLEY *in Arden*, a market town and chapelry in the parish of Wootton-wawen, and hundred of Barichway, in the county of Warwick, England, is built on the bank of a small river at the distance of about 10 miles from Warwick. In the year 1800 the town consisted of 245 houses, and contained 1098 inhabitants. In the reign of Henry III. Peter de Montford obtained the grant of a weekly "mercate," or market, for this place, and a yearly fair for two days. The chapel in this town was built about the 41st year of Edward III.d's reign, at the sole expence of the inhabitants. In the 26th of Henry VI. a hospital was built here for the relief of poor people and strangers. Dugdale describes 19 shields of arms which were painted on the glass of the chapel windows. Dugdale's Antiquities of Warwickshire, fol. 1656.

HENLEY-*house*, a station or factory of Canada, belonging to the Hudson Bay company, on the N. bank of Albany river; 150 miles S.W. of Albany fort. N. lat. 51° 14′ 27″. W. long 85° 5′ 54′.

HENLOPEN CAPE, a cape of America, which forms the S.W. side of the entrance of Delaware bay, and cape Mary on the N.E. side; 28 miles apart. It lies in N. lat. 38° 50′. W. long. 75° 26. Here is a handsome light-house, maintained at the annual expence of about 650*l.*, and visible at sea at the distance of 10 leagues.

HEN-MOULD SOIL, in *Agriculture*, a term used by the husbandmen in Northamptonshire, and other counties, to express a black, hollow, spungy, and mouldering earth, usually found at the bottoms of hills.

It is an earth much fitter for grazing than for corn, because it will never settle close enough to the grain to keep it sufficiently steady while it is growing up, without which, the farmers observe, it either does not grow well; or if it seem to thrive, as it will in some years, the growth is rank, and yields much straw, but little ear.

It is too moist, and to that is principally to be attributed this rankness of the crop in some years; and the occasion of its retaining so much moisture is, that it usually has a bed of a stiff clay, which will not let the water run off into the under strata.

In some places they also give this name to a black, rich, and dense earth, with streaks of a whitish mould in many parts. This sort of hen-mould is usually found very rich and fertile. Moreton's Northamp. p. 37.

HENNA, in *Botany*, the Arabian name of the *Lawsonia inermis*. See ALHEN and ALCANNA.

HENNABERG, in *Geography*, a county and principality of Germany, situated N. of the bishopric of Wurzburg, extending about 24 miles from N. to S. and 22 from E. to W. The land bears corn and tobacco. It abounds with forests and mountains, mines of copper, silver, iron, and steel, medicinal springs and salt water. The principal of its 13 towns are the Werra, Schleuss, Schwartza, and Felde. The inhabitants are Lutherans: four miles S. of Meinungen.

HENNADYS, the most ancient of the Libyan tribes, known in Egypt. They possess about three or four hundred horses; and with their allies can muster from 900 to 1000 cavalry.

HENNEBOND, a town of France, in the department of Morbihan, and chief place of a canton, in the district of Lorient, seated on the Blavet, which is navigable for vessels of a moderate size. The place contains 4548, and the canton 13,752 inhabitants, on a territory of 190 kiliometres, in four communes. It carries on a considerable trade in corn, iron, honey, &c. N. lat. 47° 49′. E. long. 3° 11′.

HEN-NEISHAH, a powerful and warlike, but a genteel and comely tribe, who inhabit the most fruitful, as well as the most extensive district of Numidia, in Africa. It lies betwixt the rivers Hameese and Myskim-Anah, the latter being the most southern, the former the most northern branch of the Me-jerdah, and is in every part of it watered by some choice fountain or rivulet.

HENNERSDORF, a town of Silesia, in the principality of Neisse; eight miles N.N.E. of Neisse.

HENNEVEUX, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Boulogne; three leagues E. of Boulogne.

HENNIN LIETARD, a town of France, in the department of the Straits of Calais, and chief place of a canton, in the district of Arras; three and a half leagues N.N.E. of Arras.

HENNINGES, JEROME, in *Biography*, who flourished in the second century, was a native of Germany, a disciple of Melancthon, and became distinguished by his genealogical researches. His principal works are (1) "Genealogiæ Familiarum Saxonicarum," published at Hamburgh in folio, 1596: (2) "Theatrum Genealogicum omnium Ætatum et Monarchiarum Familias complectens." This is a vast compilation, containing the Jewish families from Adam to the destruction of Jerusalem: the origin of all other nations, and

the families of the ſecond and third monarchies: the families of ancient Greece and Italy, and thoſe of all the principal modern kingdoms. Moreri.

HENNUYER, John, a French prelate, illuſtrious for the humanity and ſpirit which he diſplayed in oppoſing the maſſacre of the Proteſtants in the reign of Charles IX., was born at St. Quintin, in Picardy, in the year 1497. He was educated at Paris, in the college of Navarre, and paſſed through the various duties of his ſituation with diſtinguiſhed reputation. In 1539 he was admitted to the degree of doctor by the faculty of the Sorbonne; was appointed profeſſor of theology in the college of Navarre, and ſelected to ſuperintend the ſtudies of Anthony of Bourbon, afterwards king of Navarre. In 1553 he was appointed confeſſor to Henry II.; in 1557 he was nominated to the ſee of Loderè, from which, in the following year, he was tranſlated to that of Liſieux. In this ſituation he acquired immortal honour, by reſiſting the infamous project of the court to follow up the maſſacre at Paris on St. Bartholomew's day, by the murder of the Proteſtants in his dioceſe. Notwithſtanding the bigotry of the court, this act of virtue extorted from the king a high commendation of the biſhop's firmneſs and humanity. He died in 1577, at which time he was dean of the faculty of theology at Paris. Moreri.

HENOTHRIX, in *Natural Hiſtory*, the name of a fly of the ſeticauda, or hair-tailed kind. This is diſtinguiſhed from the others by having only one hair, and is called alſo by ſome uniſeta. The whole body of this ſpecies is black, except the middle of the back and belly, which are red; the wings are ſilvery, and the antennæ very ſmall and black. It is very common in the warm climates, and is uſually found ſitting on the ammi, or biſhop's weed; whence it is called by ſome the ammi fly.

HENOTICUM, Ἑνωτικον, q. d. *reconciliative*; of ἑνω, *I unite*, in *Church Hiſtory*, a famous edict of the emperor Zeno, publiſhed A. D. 482, and intended to reconcile and re-unite the Eutychians with the Catholics.

It was procured of the emperor by means of Acacius, patriarch of Conſtantinople, with the aſſiſtance of the friends of Peter Mongus and Peter Trullo.

The ſting of this edict lies here; that it repeats and confirms all that had been enacted in the councils of Nice, Conſtantinople, Epheſus, and Chalcedon, againſt the Arians, Neſtorians, and Eutychians, without making any particular mention of the council of Chalcedon. It is in form of a letter, addreſſed by Zeno to the biſhops, prieſts, monks, and people of Egypt and Libya. It was oppoſed by the Catholics, and condemned in form by pope Felix II.

HENRICHEMONT, in *Geography*, a town of France, in the department of the Cher, and chief place of a canton, in the diſtrict of Sancerre, 3¼ leagues S. of Aubigny. The place contains 2633, and the canton 7087 inhabitants, on a territory of 185 kiliometres, in 7 communes.

HENRICIANS, in *Eccleſiaſtical Hiſtory*, a ſect ſo called from Henry its founder, who, though a monk and hermit, undertook to reform the ſuperſtition and vices of the clergy. For this purpoſe he left Lauſanne, in Switzerland, and, removing from different places, at length ſettled at Thouloufe, in the year 1147, and there exerciſed his miniſterial function, till being overcome by the oppoſition of Bernard, abbot of Clairval, and condemned by pope Eugenius III. at a council aſſembled at Rheims, he was committed to a cloſe priſon in 1148, where he ſoon ended his days. This reformer rejected the baptiſm of infants; ſeverely cenſured the corrupt manners of the clergy; treated the feſtivals and ceremonies of the church with the utmoſt contempt, and held clandeſtine aſſemblies for inculcating his peculiar doctrines. Moſheim's Eccl. Hiſt. vol. iii. See Petrobrussians.

HENRICKSWALD, in *Geography*, a town of Pruſſian Lithuania; 6 miles W.S.W. of Tilſit. N. lat. 47° 18'. E. long. 2° 36'.

HENRICO, a county of America, in Virginia, about 30 miles long and 7 broad, containing 4541 free inhabitants, and 4608 ſlaves. It is ſurrounded by Hanover, Charles city, Goochland counties, and James river. The coal-mines of this county have produced conſiderable profit to the proprietors. Its chief town is Richmond.

HENRIQUELLE, a remarkable ſalt pond in the Spaniſh part of the iſland of St. Domingo, about 22 leagues in circuit, inhabited by lizards and alligators, and land-tortoiſes, of a large ſize. The central part is an iſland, about two leagues long, and one wide, in which is a ſpring of freſh water, well ſtocked with cabritoes, and hence called "Cabito Iſland." This pond is about 11 leagues E. of Port-au-Prince.

HENRY I. in *Biography*, emperor of Germany, was ſon of Otho, duke of Saxony, by a daughter of the emperor Arnulph. He was himſelf duke of Saxony, and was eſteemed a perſon of great conſequence when the emperor Conrad I. on his death-bed, ſent him the inſignia of his office, and an aſſembly of the nobles confirmed him in the imperial dignity in 919. His firſt concern as emperor was to reſtore concord among the princes of Germany, in which he ſucceeded; he next defeated the Hungarians, who invaded his dominions; and then marching northwards againſt the Vandals, drove them out of Saxony, and exterminated the whole nation on the ſhores of the Baltic. He vanquiſhed the Bohemians, the Sclavonians, and the Danes, and conquered the kingdom of Lorraine. The emperor, having finiſhed his plans with regard to foreign ſtates, employed himſelf in regulating the police of his dominions, in making good laws, in building cities, and in propagating the Chriſtian religion among neighbouring heathen tribes. On the expiration of the truce with the Hungarians, they made an irruption in 932, with a large army, the main body of which he defeated with prodigious ſlaughter. Having reſtored peace and good order into all parts of his dominions, he determined to comply with the pope's invitation to receive from him the imperial crown in Rome. He ſet out for Italy at the head of an army, but died on his journey, at the age of ſixty. This was in the year 936, but he had the ſatisfaction of ſeeing the ſucceſſion to the empire ſettled by the princes upon his ſon Otho. Henry was accounted one of the ableſt princes of his time, equally qualified for the duties of war and peace, and zealouſly attached to the intereſts of religion. Univer. Hiſt.

Henry II. emperor, duke of Bavaria, was elected to the imperial throne in 1002, to ſucceed his couſin Otho III. The troubles excited in Germany by the king of Poland, and a revolt of the Sclavonians, gave full employment to his arms for ſome time, and it was not till 1005, that he was able to march to Italy, and receive the crown at Pavia. On his return to Germany he had new troubles to contend with, and new wars to engage in. To avoid theſe calamities, he would gladly have reſigned the ſplendour of the throne, and have retired to a monaſtery. He was, however, diſſuaded from the project, reſumed his accuſtomed activity, and in 1014 repaſſed into Italy, and received the crown at Rome from pope Benedict VIII., to whom he promiſed fidelity. His wife, Cunegunda, was accuſed of want of chaſtity, and ſhe thought it neceſſary to vindicate her honour by undergoing the ordeal; whether this was a ſatisfactory

ſatisfactory proof of her innocence may be doubted, ſince it is well known that the emperor, though married to her, lived in a perpetual ſtate of continence, ſo that, ſays the hiſtorian, any conjugal diſhonour he underwent is neither to be wondered at nor pitied. The laſt tranſaction of this reign was an interview between the emperor and Robert king of France, in which they agreed upon certain regulations of church and ſtate, for the benefit of their reſpective dominions. Henry died in 1021, after a proſperous but unquiet reign of twenty years. The reverence in which he held the church, obtained for him the title of THE HOLY, and he and his empreſs have been enrolled among the Romiſh ſaints.

HENRY III. emperor, ſurnamed the Black, ſucceeded to the empire at the deceaſe of his father Conrad II. in 1039. Scarcely had he aſcended the throne when he was obliged to take up arms againſt the duke of Bohemia, whom he ſubdued. In 1046, he marched into Italy, where three popes had been contending for the holy ſee, which at length was conferred upon a fourth competitor, Gregory VI. The emperor, offended at this election, cauſed the pontiff to be depoſed, and a German biſhop to be placed in the papal chair, by the name of Clement II. who then inveſted the heads of Henry and his empreſs with the imperial crown. On this ſubject new diſputes occurred, and it was not till Victor II. was choſen by the Romans, and his election was confirmed by the emperor, that the contending claims were for a time quieted. Another war in Hungary employed his arms, which was ſucceeded by troubles in Bavaria, occaſioned by the tyrannical government of its young duke. Henry, without heſitation, diveſted him of his dominions, which he conferred on his own ſon, then an infant. In 1055, the emperor again viſited Italy, and was preſent in a council held at Florence, and after a progreſs through the country he returned to Germany. At this period, the empire was afflicted with famine, which was aggravated by an irruption of the Sclaves into Saxony, in which they defeated the imperial general, and ravaged the whole province. Henry was overwhelmed with theſe diſaſters, and having convoked a diet at Goſlar, in which his ſon was acknowledged king of the Romans, he was taken ill and died in 1056, after a reign of ſeventeen years.

HENRY IV. the Great, ſon and ſucceſſor to the preceding, was but ſix years old when his father died; the regency was committed to his mother, the empreſs Agnes, who became unpopular, becauſe ſhe had not power to prevent many inteſtine commotions and was accordingly diſpoſſeſſed of her authority in 1062. The guardianſhip of the young emperor was committed to the archbiſhops of Cologn and Bremen, the latter of whom has been accuſed of encouraging the young prince in every ſpecies of licentiouſneſs in order to maintain an influence over him. Henry early diſtinguiſhed himſelf by a native courage, and when he attained the age of manhood he took up his reſidence at Goſlar in Saxony, with the expreſs purpoſe of quelling the lawleſs proceedings which had long prevailed in that country. To this end he erected a number of caſtles, which obliged him to lay taxes upon his people, who formed a confederacy againſt his authority. An agreement ſoon followed, but his repeated miſconduct deprived him of the attachment of his beſt friends, and the princes of the empire met together to conſider on the propriety of his depoſition; but he heard of their proceedings, and, by ſolemn promiſes of amendment, appeaſed their diſpleaſure. A revolt of the Saxons followed, in which Henry in perſon gave them a terrible defeat, and, purſuing his victory, made himſelf maſter of the whole country, and reduced them to ſue for peace on any terms. In the mean time, Hildebrand had been elevated to the popedom under the name of Gregory VII. to which, though not pleaſing to the emperor, he did not think proper to object. The firſt acts of the pontiff were levelled at the emperor; theſe and other inſults he for ſome time bore with apparent patience, till at length Gregory ſummoned him to appear at Rome, to anſwer to various accuſations with which he ſtood charged. Henry, in his turn, cauſed the pope to be ſolemnly depoſed at an aſſembly of prelates at Worms in 1076. Gregory, to be revenged on his adverſary, depoſed and excommunicated the emperor; a civil war enſued, in which Henry, deſerted by his own partiſans, on whom he depended, was reduced to humble himſelf as the only reſource of ſaving his crown. He went to Italy and made his ſubmiſſion, but Gregory was not to be appeaſed. (See GREGORY.) Henry now reſolved upon vengeance. The electors choſe Rodolphus duke of Suabia, and the pope confirmed the title, but Henry attacked and defeated his competitor, and put him to death. He then called a council, which depoſed the pope, and elected in his room the archbiſhop of Ravenna. In 1106, his ſon Henry aſſumed the title, and ſeized upon the imperial treaſures at Spires, but finding that his father was likely to prove the ſtrongeſt, he affected remorſe, threw himſelf at the emperor's feet, obtained forgiveneſs, and then perſuaded him to diſband the army. As ſoon as this was done, he confined his father a priſoner in his own houſe, and then calling an aſſembly at Mentz, he aſſiſted in his depoſition. This act was performed with the moſt indecent and unfeeling rigour. The prelates ſnatched off his crown, dragged the aged monarch from his throne, and tore from his back the royal robes. In the midſt of this outrage, Henry, with tears trickling down his cheeks, exclaimed, "Great God! thou art truly the God of vengeance! I have ſinned, I confeſs, and have merited this ſhame by the follies of my youth, and thou wilt not fail to puniſh traitors for their perjury and ingratitude." His mind was afterwards ſo far overcome by the accumulation of his misfortunes, that he made a voluntary reſignation of the crown in his ſon's favour, beſeeching, at the ſame time, an abſolution from the ſentence of excommunication. This was refuſed, and it redounds to the infamy of his ſon, and of the times in which he lived, that the depoſed emperor was ſuffered to want the common neceſſaries of life. He was reduced ſo far as to ſolicit from the biſhop of Spires an office in the cathedral, which he himſelf had liberally endowed. This was refuſed, and the humiliated monarch cried out with a deep ſigh "pity me, my dear friends, for I am touched with the hand of the lord." After a long confinement and enduring much diſtreſs he eſcaped to Cologne, where he was once more acknowledged as lawful emperor, and fortune ſeemed diſpoſed to ſmile on him, when he died in the fifty-ſixth year of his age. His body remained five years unburied till the ſentence of excommunication was taken off. This emperor ſaw and experienced the moſt ſerious viciſſitudes of life; he was a man of active courage, which had been tried in ſixty-two battles at which he was perſonally preſent. He poſſeſſed many eminent qualities, he was mild and clement in his diſpoſition, and ſingularly charitable, but the licentiouſneſs of his youth laid a foundation for the misfortunes and diſgraces of his reign.

HENRY V. emperor, ſon of the preceding, was born in 1081, and ſeized, as we have ſeen, upon the crown in 1106. After the death of his father he became involved in a diſpute with pope Paſchal, concerning the buſineſs of inveſtitures. An

An invaſion of Hungary, and an attempt to conquer Sileſia from the Poles, employed his arms in 1107, 8, and 9, but with no great ſucceſs. In 1110 he paſſed into Italy with a powerful army, in the raiſing of which he was aided by a large ſum paid as the dowry of his wife Matilda, or Maud, daughter of Henry I. of England. Paſcal entered into a treaty with him, containing ample conceſſions with reſpect to inveſtitures; but Henry ſoon found that he did not mean to abide by the pledge, and made the pope, his cardinals, and many perſons of rank, his priſoners, and after razing the very walls of Rome in ſeveral places he encamped in the fields. Paſchal now not only gladly confirmed the treaty in the moſt ſolemn manner, but crowned the emperor with his own hands. On his return to Germany, he was accompanied to the foot of the Alps by the pope and principal clergy, but ſcarcely had he left their country than they annulled the agreement, which they contended was compulſory, and therefore not to be regarded. A rebellion in Saxony ſoon followed, and Henry, in attempting to quell it, received a great defeat. The prelates and nobles, taking advantage of his misfortunes, immediately excommunicated him. He was continually involved in diſputes till 1122, when he ſent an embaſſy to pope Calixtus II. in order to compromiſe their differences. In this agreement he abandoned many of the principles for which he had been contending, and in return received abſolution, and was reſtored to the communion of the church. In 1124 the emperor, at the inſtigation of his father-in-law, the king of England, invaded France, but was compelled to retreat without having effected any thing. He died at Utrecht in 1125, at the age of forty-four. He was a man of much vigour, and endowed with great talents for government, but was characterized by his biographers as cruel, haughty, and avaricious.

Henry VI. emperor, ſurnamed the *Severe*, eldeſt ſon of the emperor Frederic Barbaroſſa, was declared king of the Romans by his father in 1184, when he was about twenty-four years of age. He married, in 1186, Conſtance, ſiſter and heireſs of William, king of Sicily. Frederic, on his departure for the Holy Land, left the care of the empire to Henry, who ſucceſsfully defended himſelf againſt the attack of Henry the Lion, duke of Saxony. In 1190 he ſucceeded to the imperial crown, and in the following year marched with an army into Italy, and was crowned at Rome with his empreſs. He then attempted to recover the kingdom of the two Sicilies from Tancred, natural brother of the empreſs, and marched an army into the ſouth of Italy for that purpoſe. A peſtilential diſeaſe ſeized on his army, and he was obliged to retire. But in a ſhort time afterwards he made freſh preparations for the ſame purpoſe, and, while he was thus employed, Richard I. king of England, fell into the hands of the duke of Auſtria, in his return from Paleſtine, from whom he was claimed by the emperor, who hoped thereby to ſhare in the ranſom. The money thus gained ſerved to augment Henry's army. He returned to Italy in 1194, and took the city of Salerno, upon the inhabitants of which he ſo terribly revenged an affront they had offered the empreſs, as juſtly to entitle him to the epithet of *Severe*, or *Cruel*. Tancred was now dead, but the mercileſs Henry purſued the widow and unoffending children, ſtript them of their kingdom and property, and confined the females in a monaſtery, while he mutilated the ſon and put out his eyes. In 1196, after various other acts of ſavage tyranny, the emperor cauſed his ſon Frederic to be crowned while he lay in his cradle. He next engaged in a cruſade, and by his eloquence induced the princes of the empire to join in the ſame wild project. Three armies were raiſed, with one of which Henry proceeded to Italy, in order to reduce the Norman rebels of Naples and Sicily. His cruelties produced a ſeries of inſurrections, and at length the inſurgents were joined by Conſtance, his empreſs, who felt for the injuries inflicted on her countrymen. Henry was beſieged in a caſtle in Sicily, and was obliged to make a treaty on very unfavourable terms, ſoon after which, as he was preparing to depart, he was carried off by illneſs at Meſſina, in the eighth year of his reign.

Henry VII. emperor, duke of Luxemburg, was elected to the imperial crown in 1308, on the death of the emperor Albert. One of the early acts of his government was the expulſion of the Jews from Germany, in order that he might have an opportunity of pillaging them. He then prepared to march into Italy, the chief towns of which were diſtracted by the oppoſite parties of the Guelphs and Gibellines. At firſt the pope raiſed a confederacy againſt him, but he was admitted into moſt of the Lombard towns, and received the imperial crown at Milan. He attacked and took Breſcia after an obſtinate reſiſtance, and in 1312 preſented himſelf in order of battle before the gates of Rome. After many other warlike acts, he died at the convent of Buonconvento in 1313, at the age of 51.

Henry Raspon, landgrave of Thuringia, was elected emperor by the eccleſiaſtical princes in 1246, when pope Innocent II. had depoſed Frederick II.; but the newly made emperor died in the following year of a wound inflicted while he was contending with his competitor.

Henry I. king of France, ſon of king Robert, was aſſociated to the crown in 1026, and ſucceeded to the entire regal authority in 1031. His mother, Conſtance of Provence, excited a revolt againſt him in favour of her younger ſon Robert, but without ſucceſs. Henry died, with the reputation of a valiant commander and a good king, in the year 1060, aged 55 years. He had, previouſly to his death, cauſed his eldeſt ſon Philip, then ſeven years of age, to be conſecrated at Rheims. Univer. Hiſt.

Henry II. king of France, ſon of Francis I. was born in 1518, and came into poſſeſſion of the crown in 1543, at which time France was at war with England. In 1550 peace was reſtored, and Boulogne ſurrendered to the French for a very large ſum. The year following a league was entered into, between him and the Proteſtant princes of Germany, againſt Charles V. which produced a ruinous war to France. In 1559, Henry concluded a diſhonourable peace, and in the ſame year he was wounded at a tournament by a lance, of which he died. Henry II. was poſſeſſed of ſeveral of thoſe qualities which render a king of France popular; he was warlike, gallant, magnificent, eloquent, and a patron of learning; but he was diſſolute, prodigal, and inattentive to the duties of his ſtation. It cannot be overlooked, that during this reign great ſeverities were exerciſed upon the French Proteſtants, and it is certain that in one inſtance the king himſelf was preſent at a dreadful execution of theſe unhappy people, the idea of which is ſaid to have haunted his memory ſo long as he lived. At the ſame moment that he was murdering the French Proteſtants without any feelings of compunction, he was making a league with thoſe of Germany.

Henry III. king of France, third ſon of Henry II. ſucceeded his brother Charles IX. in 1573. While he was duke of Anjou, the Poles elected him to their throne on the death of Sigiſmund Auguſtus; but he renounced it on taking poſſeſſion of that of France. He concluded a peace with the Huguenots, in which toleration was granted them. This was revoked in 1586, when the Proteſtant princes, of whom Henry king of Navarre was the chief, had recourſe to arms.

The king of Navarre defeated, in 1587, the Catholic army. The duke of Guiſe, on the other hand, obtained a ſignal advantage over the Huguenots and their allies; but on his marching to Paris the gates were ſhut againſt him. The people, however, were attached to Guiſe, and the king was obliged to retire from his capital, which was commanded by the head of the Catholic league. Thus France was divided into three parties, the Royaliſts, the Guiſes, and the Huguenots. At length the two firſt were reconciled in appearance, but Henry cauſed the duke to be aſſaſſinated with his brother the cardinal. The flames of civil war broke out with additional fury. The pope excommunicated the king, and his own parliament inſtituted a criminal proceſs againſt him. In this exigency he had recourſe to the king of Navarre, who ſet out on his march to Paris, but the face of affairs was ſuddenly changed by the death of the king of France, who was aſſaſſinated in 1589, by James Clement, a Dominican prieſt. Thus, he who had been the death of multitudes, and who, with the moſt artful hypocriſy, had cauſed the Guiſes to be maſſacred, fell himſelf by the hand of an aſſaſſin, who had been led to believe that the act would prove beneficial to the church and world. Henry III. lived long enough to be generally hated and deſpiſed by his ſubjects, few of whom probably offered one ſigh when the news of his death was promulgated: he, nevertheleſs, poſſeſſed many qualities that might have rendered him illuſtrious and popular. With him, as we have ſeen elſewhere, ended the royal branch of the houſe of Valois. See FRANCE.

HENRY IV., king of France and Navarre, called the Great, was born in 1553, at Pau, the capital of Bearne. His father was Antony de Bourbon, king of Navarre, and his mother Joan d'Albert. Henry was brought up by his grandfather in a ſimple and hardy manner, and thus was laid the foundation of a vigorous conſtitution and temperate habits. Being deſcended from Lewis IX. of France, he became the heir of that kingdom, but as he was educated a Proteſtant, his claim was reſiſted. He early diſtinguiſhed himſelf in arms: he learned the art of war under the admiral Coligny, and was proud to imitate ſo great a model. After the peace of St. Germain in 1570, he went to Paris, and two years afterwards married the ſiſter of Charles IX. This union was celebrated at the moment that Charles and his mother Catharine were plotting the deſtruction of the Huguenot party. The execrable St. Bartholomew ſoon followed, and on that fatal day Henry was brought before the king, whoſe throne was, as it were, drenched in Proteſtant blood, and who, with a countenance well adapted to the infamy of the deed, gave him his option of Maſs, Death, or the Baſtile; in the moment of ſurpriſe and horror he choſe the firſt. From this time he was kept a kind of priſoner at court, and was led to practiſe thoſe arts of diſſimulation which were the general policy of the time. To drive away more ſerious and gloomy thoughts he fell in with the licentious manners of the age, and it is believed that he entered likewiſe into a political intrigue, for aboliſhing the power of the queen mother, and baniſhing the Guiſes from court. The plot was diſcovered, and Henry was arreſted and thrown into priſon, from whence he found means to eſcape and retire to Alençon, where he renewed his profeſſion of the reformed religion; and put himſelf at the head of the Huguenot party. In the war which followed, he performed all the duties of the hardy ſoldier, as well as thoſe of the brave commander. He ſlept in his tent upon the ſtraw, eat ammunition bread, viſited in perſon the works and batteries, and expoſed himſelf freely to every danger. The cheerful frankneſs of his manners rendered him extremely popular among the ſoldiers, who emulated his example, and followed him with enthuſiaſm. He ſupported the cauſe in which he engaged with an invincible ſpirit, and when excommunicated by Sixtus V. he cauſed an appeal of defiance to be poſted up in the public places of Rome. In 1589 he ſucceeded to the crown of France, but his religion proving an obſtacle to his coronation, he conſented to abjure it in the year 1593. It would be uncandid to mention this renunciation of his principles as dictated merely by ſelf-intereſt, he had properly higher objects in view: he ſaw his country torn to pieces with contending factions, ſome towns declaring for Henry, and others for a rival who was a Catholic, and ſupported by the League. In 1590 he had valiantly fought in defence of his right, and before the battle he addreſſed his troops, "My children, if you loſe ſight of your colours, rally to my white plume, you will always find in it the path to honour and glory." His conduct was anſwerable to his profeſſion, nothing could reſiſt his impetuous valour, and the leaguers ſuſtained a total and bloody defeat. In the midſt of the rout Henry followed, crying out, "Save the French," and his great clemency on this occaſion added a number of enemies to his own army. He reſumed the blockade of Paris, where the extreme of fanaticiſm prevented all overtures to accommodation. The Sorbonne iſſued a decree of excommunication againſt Henry, making him incapable of wearing the crown; though he was not to be daunted by the thunders of the church, his heart melted over the injuries of his country. The war ſtill continued with various ſucceſs, and the king's enemies ſhewed no diſpoſition to come to terms: to accommodate matters, and to ſtop the effuſion of blood, Henry became a Catholic, to which meaſure, it is ſaid, the moſt ſenſible and faithful of his Proteſtant ſervants adviſed him. Henry was accordingly received into his capital in the following year; ſcarcely, however, was he ſettled in the city, when an attempt was made to aſſaſſinate him by Chatel, a furious bigot, who had been prepared for the murderous taſk by the Jeſuits. Henry fortunately eſcaped, and the whole order was declared by the parliament of Paris, "corruptors of the youth, diſturbers of the peace, and enemies of the king and ſtate," and was baniſhed the kingdom. In 1595 he iſſued the edict of Nantz, granting toleration to the Proteſtants. The ſame year he entered into a war with Spain, which laſted till 1598, after which his country enjoyed uninterrupted peace till his death. During the interval of quiet he had leiſure to attend to thoſe internal improvements, and that melioration of the condition of his ſubjects, which his own good ſenſe and benevolent diſpoſition ſuggeſted; in this he was aſſiſted by the honeſt and indefatigable exertions of his miniſter the duke de Sully. The wiſe adminiſtration of this miniſter brought order into the finances and foſtered agriculture, and the king himſelf introduced ſeveral new branches of manufacture, and encouraged commerce and the arts. Henry had long entertained the project of diminiſhing the overgrown power of the houſe of Auſtria, and to this he joined the grand, though probably chimerical ſcheme of forming a kind of European federative republic, conſiſting of powers ſo well balanced, that they ſhould be able to prevent future wars or encroachments. Such a ſyſtem, however plauſible at firſt ſight, cannot be deſirable, for if they were able to prevent wars, they would be ſufficiently powerful to cruſh every effort among the people for meliorating their condition; they might indeed, eſtabliſh in every country the moſt cruel deſpotiſm, none daring to reſiſt their power. Vaſt preparations were made for this enterprize; great ſums of money were laid up in the treaſury; magazines were formed; the army reinforced, and carefully diſciplined; alliances were negociated; and nothing delayed the king's departure at the head of the troops but the ceremony of the queen's coronation. Hiſtorians have

have aſſerted, and it has been generally credited, that he felt a great repugnance to this ceremonial, and entertained a preſentiment of ſome fatal accident connected with it: a circumſtance naturally ariſing from the ſeveral attempts which had already been made againſt his life. The ſolemnity was performed with extraordinary magnificence. On the next day, May 14, 1610, as he was riding in his coach through the ſtreets, he was ſtabbed by Ravaillac, a mad enthuſiaſt. The wound was inſtantly fatal, he neither roſe nor ſpoke again. Henry IV. was the moſt popular of all the French kings. "He united," ſays Henault, "to extreme frankneſs the moſt dextrous policy; to the moſt elevated ſentiments a charming ſimplicity of manners; to a ſoldier's courage an inexhauſtible fund of humanity." As a king he was diſtinguiſhed by a fellow-feeling for his ſubjects, which is rarely met with in that condition. He had lived ſo much among them that he knew all the detail of common life, and their comfort and proſperity were as much his wiſh as his own glory. Hence he obtained univerſally the epithet of "Good," even from thoſe who would not allow him the title of "Great."

Henry I. king of England, ſurnamed Beauclerc, fourth ſon of William the Conqueror, was born in 1068, and ſucceeded to the crown of England upon the death of his brother Rufus, in the year 1100, at which time his elder brother Robert was in Normandy. Robert, unwilling to be diſpoſſeſſed of his right, invaded the kingdom, but at length agreed with Henry to ſurrender his claim on condition of a yearly tribute being paid to him; each brother, by this treaty, was to inherit the dominions of the other in caſe of death without iſſue, and the adherents of both were to receive full pardon. Henry, however, when the danger was over, made no ſcruple of infringing the latter part of the covenant, and the ruin of ſome great families was the conſequence. He now began to meditate offenſive meaſures, invaded Normandy, defeated his brother Robert, made him priſoner, and reduced the whole duchy. It is to his diſgrace that he kept his brother confined in the caſtle of Cardiff till his death, a long ſpace of twenty-eight years. The uſurpation of Normandy involved Henry in continual wars on the continent, and was a ſource of much pecuniary diſtreſs among the Engliſh. Henry was generally ſucceſsful againſt his enemies, but he met with a moſt ſevere domeſtic misfortune, in the loſs of his only ſon William, at ſea, juſt as he was approaching manhood. He was drowned in 1120, on returning from Normandy, together with his ſiſter, whoſe ſhrieks recalled him to the ſinking ſhip after he had got clear off in the long-boat. The unhappy father was never ſeen to ſmile again. Henry governed his dominions with prudence, and though he firmly maintained his authority, he was not deaf to the complaint of grievances. He reformed the court, and withſtood the claims of the papal ſee. He forgave all the debts owing to the crown prior to his acceſſion, and he granted a charter to London, which was probably the firſt ſtep towards rendering that city a corporation. He died in Normandy in 1135, and his remains were brought to England, and interred in the abbey of Reading. This prince was one of the moſt accompliſhed that has ever filled the Engliſh throne: he poſſeſſed all the great qualities both of body and mind, natural and acquired, which could fit him for ſo high a ſtation. By his great progreſs in literature, he acquired the name of "Beauclerc," or the ſcholar. He aboliſhed the curfew-bell, and eſtabliſhed a ſtandard for weights and meaſures. It is obſerved by Mr. Hume, (to whoſe hiſtory we ſhall have recourſe for facts in the following articles, as we have had in this,) "that this prince, from indulgence to his tenants, changed the rents of his demeſnes, which were formerly paid in kind, into money, which was more eaſily remitted to the exchequer. But the great ſcarcity of coin would render that commutation difficult to be executed, while at the ſame time proviſions could not be ſent to a diſtant quarter of the kingdom. This affords a probable reaſon why the ancient kings of England ſo frequently changed their place of abode. They carried their court from one place to another, that they might conſume on the ſpot the revenue of their ſeveral demeſnes." Hume's Hiſt.

Henry II. the firſt of the Plantagenets, born in Normandy in 1132, was the ſon of Geoffrey, count of Anjou, by the empreſs Matilda, daughter of king Henry I. He ſucceeded Stephen to the crown of England in 1154, and one of the early acts of his reign was the diſmiſſing all the foreign mercenaries who had been retained by his predeceſſor. He next ſought for glory on the continent, and added to his dominions the provinces of Anjou, Touraine, Maine, Poictou, Saintonge, Guienne, and Gaſcony. His reign at home was greatly affected by the diſputes between him and Becket, archbiſhop of Canterbury, on account of whoſe murder, the pope obliged the king to undergo penance at Becket's tomb at Canterbury. In 1170 he cauſed his eldeſt ſon to be crowned king of England. After this he conquered Ireland, and the following year his ſons rebelled againſt him, being inſtigated to this unnatural conduct by their mother, on account of Henry's attachment to fair Roſamond Clifford, the theme of popular ballads and romances, not forgotten even at this diſtant period. The ſons of the king, in their uſurpations, were aſſiſted by the kings of France and Scotland, till a peace was concluded between all the parties. In 1182 his ſon Henry died, being in his 20th year, and ſhortly after his third ſon Richard again took up arms againſt his father, and was ſupported in his project by the king of France. Henry, being defeated in Normandy, was obliged to ſubmit to diſgraceful terms. He died in 1189, in the 56th year of his age. Such is the outline of the events of the reign of Henry II. This prince paſſed much more of his time on the continent than in this iſland. He was ſurrounded with the Engliſh gentry and nobility when abroad. The French gentry and nobles attended him when he reſided in England. Both nations acted in the government as if they were the ſame people; and, on many occaſions, the legiſlatures ſeem not to have been diſtinguiſhed. As the king and all the Engliſh barons were of French extraction, the manners of that people acquired the aſcendancy, and were regarded as models of imitation. Henry II. was the greateſt prince of his time for wiſdom, virtue, and abilities, and the moſt powerful in extent of dominion of all thoſe that had ever filled the throne of England. "His character," ſays our hiſtorian, "in private as well as in public life, is almoſt without a blemiſh, and he ſeems to have poſſeſſed every accompliſhment, both of body and mind, which makes a man either eſtimable or amiable. He loved peace, but poſſeſſed both bravery and conduct in war, was provident without timidity, ſevere in the execution of juſtice without rigour; and temperate without auſterity." His care in adminiſtering juſtice had gained him ſo great a reputation, that even foreign and diſtant princes made him arbiter, and ſubmitted their differences to his judgment. He aboliſhed the barbarous cuſtom of confiſcating ſhips which had been wrecked on the coaſt, and he put an end to the odious tax of Danegelt.

Henry III. ſon of king John, was born in 1207, and ſucceeded to the crown of England in 1216. The reign of this prince is the longeſt in the Engliſh annals, but it is not full of events. The early part of it was managed wholly by thoſe who had been appointed his guardians: as he ap-

proached to manhood, Henry displayed a character totally unqualified for his royal station. One of his first false steps was the discarding his ablest and most faithful minister Hubert du Burgh, and giving his confidence to rapacious and unprincipled foreigners. He was soon obliged to relinquish Normandy and the other French provinces, after which a civil war broke out in England, and the king was taken prisoner by the barons. The tide of affairs turning in his favour, he deprived several of these lords of their estates, and gave them to his own friends. He cancelled the great charter, and suffered the pope to appoint an archbishop of Canterbury, and to collect the tenths of the kingdom. He died at St. Edmondsbury in the 64th year of his age, and 56th of his reign. He was noted for his piety and devotion, and for a regular attendance on public worship. He was incapable of swaying the sceptre, but was by no means qualified for being a tyrant; yet there are instances of oppression in his reign, which are inconsistent with all rules of good government. On the whole, it may be affirmed, that greater abilities, with good dispositions, would have prevented him from falling into his faults; or with worse dispositions, would have enabled him to maintain and defend them.

Henry IV. surnamed *Bolingbroke*, the first king of the house of Lancaster, was born in 1367. He was the eldest son of John of Gaunt, duke of Lancaster, third son of Edward III., by the heiress of Edmond earl of Lancaster, son of Henry III. In the reign of Richard II. he was made earl of Derby, and then duke of Hereford. Under this title he appeared in the parliament of 1398, and preferred an accusation of high treason against Mowbray, duke of Norfolk. A challenge ensued, but the king banished the combatants from his kingdom. Hereford, on the death of his father, in 1399, succeeded to the dukedom of Lancaster, and laid claim to the estates belonging to his title, which the king refused to grant. The duke therefore landed with a retinue to make good his title, and being joined by several of the discontented nobles, he soon found himself at the head of 60,000 men. The feeble Richard resigned his crown, and the duke was proclaimed king under the title of Henry IV. The deposed monarch was speedily removed out of the way, and after a very short time the nobles conspired against the sovereign, whom they had just before elevated to the throne. Their plots were discovered, and the authors consigned to the hands of the executioner. Henry, to ingratiate himself with the clergy, professed a high regard for piety, and the interests of the church; and to give proof of his zeal, he committed, without hesitation or remorse, those convicted of heresy to the flames. A great part of the reign was disquieted by civil contentions between the houses of York and Lancaster, on account of Henry's usurpation. The continual contests which agitated his government brought him, while in the prime of life, into a declining state of health, and he begun seriously to consider upon whom his usurped crown should descend. The licentious conduct of his son Henry augmented the monarch's cares for futurity; and in proportion to the decay of the king's strength, he was tormented with the apprehension of losing his authority before his death. He endeavoured to tranquillize his conscience by a resolution of taking the cross and visiting the Holy Land, but he died in March 1413, before he could execute his plans, in the 46th year of his age, and the 13th of his reign. Henry was exceedingly popular when he came to the throne, but he soon lost the favour of the people, who were probably shocked at the means he used to get and to secure the crown, first by deposing and then murdering Richard II. He henceforth governed his subjects more by terror than affection, more by his own policy than by their sense of duty or allegiance. His situation, if he retained any sense of virtue, was the most unenviable that can well be conceived: and the inquietude with which he possessed his greatness, and the remorses by which, it is said, he was continually haunted, render him an object of our pity. His prudence, vigilance, and foresight, in maintaining his power, were admirable; his command of temper remarkable; his courage, both military and political, without a blemish; and he possessed many qualities which fitted him for his high station. His reign, upon the whole, has been regarded as beneficial to the nation, and particularly favourable to the rights of the Commons.

Henry V. was born at Monmouth in 1383, and succeeded to the throne on his father's death in 1413. In his youth he was very wild, but on coming to the crown he discarded his licentious companions, and conducted himself with a dignity suited to his station. He treated with high respect his father's virtuous ministers, and especially the chief justice Gascoine, who had openly vindicated the cause of justice at the expence of the prince in his dissipated career. He caused the obsequies of the unfortunate Richard to be solemnly performed, received to favour those who had shewn the greatest attachment to their lawful sovereign, and was studious to obliterate every party distinction. He had the magnanimity to treat with kindness and confidence the earl of Marche, his superior in legal title to the crown, who repaid this liberality with the most undeviating fidelity. From a desire, probably of pleasing the clergy, he put into execution the laws against the Lollards, though they were at that time headed by Oldcastle, lord Cobham, a man of considerable rank and character. He revived the claims of his predecessors upon France, and his first step was to send over ambassadors, offering peace and alliance. The reception which these met with not answering his expectation, he formed a project for conquering France; left England in the hands of a regency, and invaded that country with a numerous army, at the head of which he displayed uncommon courage. With 15,000 men he gained the battle of Agincourt, though the French had nearly four times that number. In another invasion of France, Henry shewed that he aimed at the crown of that country; but in 1420 the duke of Burgundy made an alliance with the English, which was followed by the famous treaty of Troyes, made by Henry in person with the French king, who was in a state of imbecility, and in the hands of his queen and the Burgundian faction. By this treaty, Henry engaged to marry the princess Catharine, and to leave Charles in possession of the crown of France, on condition, that after his decease, it should go to Henry and his heirs, and thenceforth be inseparably united to that of England. Henry, after espousing Catharine, took possession of Paris, and made himself master of some neighbouring places. He died at Vincennes, at the early age of thirty-four, in the 10th year of his reign. This prince possessed many virtues, and his abilities appeared equally in the cabinet and the field. The boldness of his enterprises was no less remarkable than his personal valour in conducting them. He had the talent of attaching his friends by affability, and of gaining his enemies by address and clemency. The English, dazzled by the lustre of his character, still more than by that of his victories, were reconciled to the defects in his title: the French almost forgot that he was their enemy, and his care in maintaining justice in his civil administration, and preserving discipline in his armies, made some amends to both nations for the calamities inseparable from those wars in which his short reign was almost entirely occupied.

Henry

HENRY VI., born at Windsor in 1421, was not nine months old at the death of his father Henry V. The kingdom was placed under the protectorship of his uncle the duke of Bedford, and the care of the prince was committed to Beaufort, bishop of Winchester. His grandfather Charles, king of France, died soon after, and the duke of Orleans, encouraged by the minority of Henry, assumed the title of king by the name of Charles VII. This renewed the war; the English were at first successful, and Henry was crowned at Paris. The raising the siege of Orleans by Joan of Arc gave a new turn to affairs, and the English interest rapidly declined. In 1443 a truce was made with France, which was followed by the king's marriage with Margaret of Anjou, daughter of Regnier, titular king of Sicily, Naples, and Jerusalem, but actually without a single province. Instead of obtaining a dowry, the king agreed to renounce the province of Maine in France. The queen, however, possessed a treasure in the extraordinary accomplishments of body and mind, and her masculine spirit was well fitted to compensate the weakness of her husband. The death of the duke of Bedford was a fatal blow to the cause of Henry; and to add to his misfortunes, the York party in England increased in strength, and involved the country in a civil war. They adopted the white rose as their badge of distinction, and the Lancastrians the red. After various contests the king was defeated and taken prisoner. He was treated with great respect; for the weakness and innocence of his character had impressed every one, friends and enemies, with an idea of the sanctity of his person. The queen had now full scope for shewing herself, and carried on the war with spirit, and for a time with success. At length it was agreed by parliament, who undertook to adjust the claims of the contending parties, that Henry should enjoy the crown during his life, and that the duke of York should be his successor. While this negociation was going on the queen assembled an army in the north, a battle ensued at Wakefield, and the duke of York was slain. He left a son, Edward, who restored the cause of the family, and by his success obtained the crown by popular acclamation. The people being assembled in St. John's Fields, the earl of Warwick demanded if they would have Edward or Henry for their king? The general cry was, for "A York;" the young duke being present they elected him king, by the name of Edward IV., and conducted him with great ceremony to the palace where Henry used to lodge, when within the walls of the city. This was in the month of March 1461, and it may be accounted the termination of Henry's disastrous reign. He was, however, still the sport of fortune, being again recognized, and again imprisoned: at length he died in 1471, in the Tower of London, but whether by a violent or natural death is not known. Henry was gentle, pious, and well intentioned, but too weak ever to act for himself. It is to his praise that the most splendid establishment in England for classical learning, Eton College, reveres him as a founder. To him, likewise, King's College in Cambridge owes its original foundation.

HENRY VII., first of the race of Tudors, born in 1457, was son of Edmond, earl of Richmond, and grandson of Owen Tudor and Catharine of France, the widow of Henry V. His mother was the only child of John, duke of Somerset, grandson of John of Gaunt. He was thus the representative of the Somerset branch of the royal house of Lancaster. During the usurpation and tyranny of Richard III. the people looked to the earl of Richmond, as a young prince who might restore legal government in England, and a match was projected between him and Elizabeth, eldest daughter of Edward IV., which should unite the two houses of York and Lancaster. Richard discovered the plan, and determined to defeat it, by marrying the lady himself, and applied to the court of Rome for a dispensation for that purpose, she being his own niece. Richmond, finding that there was no time to lose, landed at Milford Haven, at the head of two thousand troops, and was immediately joined by many persons of rank and consequence in that part of the country, by whose influence and example he soon found himself at the head of six thousand men. Richard met him in Bosworth field, with an army of double that number, but victory decided for the earl, the king was slain, and the conqueror was hailed on the field of battle with the title of Henry VII. Parliament was soon assembled, who recognized his right, and he was crowned previously to his marriage with Elizabeth, the heiress of the house of York, though the nation was extremely desirous of this alliance, as uniting the claims of the two rival houses, and precluding farther civil wars. He was married in the following year; but lest people should suppose that he claimed the crown solely upon the strength of this alliance, he deferred her coronation for some time, by which, he wished the priority of his own claim to be understood. He chose for his confidential servants Morton and Fox, two clergymen, from whom he probably expected more obsequiousness, than from the nobility of the realm. Discontents soon arose, and while he was on a journey into the north, an insurrection took place, which was soon suppressed; but a more serious disturbance, almost immediately succeeding the other, was excited by a priest, who procured Lambert Semnel, a youth of fifteen, son of a baker, to personate the earl of Warwick, son of the duke of Clarence, whom Henry had confined in the Tower. Semnel was sent to act his part in Ireland, and was actually proclaimed king at Dublin. He then ventured over to England, where he was led to expect support from the adherents to the duke of York, but the king having caused the true earl of Warwick to be publicly shewn in the streets of London, few were disposed to join the impostor. A battle however ensued, in which the leaders of the rebels were slain, and all who had given the smallest countenance to the conspiracy were severely fined; avarice, rather than revenge, being the ruling passion of Henry. Young Semnel he treated with contempt, by giving him freely his life, and making him the scullion of his kitchen. Semnel had been encouraged in his projects by the sister of Edward IV., the duchess dowager of Burgundy, governess of the Low Countries, who never ceased to pursue Henry. Her court had been the refuge of the mal-contents; and she now brought forward a new adventurer on the stage. She propagated a report that Richard, the younger of the sons of Edward IV., supposed to have been murdered in the Tower, had escaped that fate, and since lived in secrecy: she accordingly procured Perkin Warbeck, son of a converted Jew, of Tournay, a youth of a very prepossessing figure, to assume the character of that prince. This story soon reached the ears of the king, who employed every method in ascertaining the real birth of the pretender, and in gaining information respecting his supporters. Many of these were arrested, and convicted of high treason, among the rest Stanley, lord chamberlain, the brother of Henry's step-father, and one who had been very instrumental in raising him to the throne. This execution prevented, for the present, any open insurrection in favour of Perkin, and when his friends put him forward to support the cause he had undertaken to advocate, he was glad, after a trifling stand, to seek the protection of a sanctuary. His wife, lady Catharine Gordon, fell into the king's hands, who treated her with respect and generosity, and placed her about the person of the queen, with a liberal pension. Per-

kin delivered himself up on the promise of pardon; he was led in mock triumph through the streets of London, and then committed to the Tower. Here he engaged in a conspiracy for liberating the earl of Warwick; the plot was discovered and he was hanged. Soon after this, Henry fixed an indelible stain on his memory by the execution of the earl of Warwick, for no other crime than an attempt to recover his liberty, of which he had been unjustly deprived. Henry was now at peace, and his favourite pursuit was that of filling his coffers at the expence of his subjects. In this he was assisted by two lawyers named Empson and Dudley, who were well qualified for the work of extortion. The courts of justice were in no reign made so much the engines of oppression, as under these infamous and hard-hearted ministers, and the king, with the most insatiable rapacity, took his share in all the spoils accruing from their pillage. As, however, he declined in life his conscience smote him, and he began to appease the upbraidings of his mind by the usual methods, then resorted to, of alms, religious foundations, and other acts of atonement. He even directed restitution to be made to some whom he had injured. He reigned 24 years, and greatly increased the trade and commerce of the country. He died in 1509, in the fifty-second year of his age. The reign of Henry VII. was, in the main, fortunate for his people at home, and honourable abroad. He put an end to the civil wars, with which the nation had long been harrassed: he maintained peace and order in the state; though often severe in his punishments, he was commonly less actuated by revenge than by maxims of policy. He was always extremely attentive to his affairs, but not a deep-sighted politician; he was more expert in providing a remedy for his mistakes, than judicious in avoiding them. Avarice, as we have seen, was his ruling passion, and he remains an instance, almost singular, of a man placed in a high station, and possessed of talents for great affairs, in whom that passion predominated above ambition. This reign was the era of that depression of the feudal nobility, and elevation of the middle ranks of society, to which England has owed her prosperity. This seems to have been the constant aim of Henry, and it was especially effected by the statute which allowed of the breaking of entails, and alienation of landed estates.

Henry VIII. succeeded his father at the age of 18, and the first years of his reign were extremely popular. No prince ever ascended a throne under happier circumstances. He had a full treasury, an undisputed title, subjects flourishing in the arts of peace, and in friendship with all the neighbouring powers. He began his reign by sacrificing to popular odium, Empson and Dudley, whose extortions were made a matter of judicial prosecution; and he appointed his ministers from the best and most virtuous of his father's counsellors. He celebrated a marriage with the Infanta Catharine of Arragon; but a great disparity of years and disposition rendered it an ill-sorted union. The emperor Maximilian and pope Julius II. having leagued against France, persuaded Henry to join them; and he accordingly invaded that kingdom, where he made some conquests, and might probably have carried his arms to Paris had he pursued his advantages, instead of which he wasted his time in besieging frontier towns. His chief conquest was Tournay, to the see of which he inducted Wolsey, now become his prime minister. His arms at home were attended with much more success. James IV. of Scotland had invaded England, and was completely defeated at Flodden field, where the king and his principal nobility perished. Henry immediately granted peace to the queen his sister, declared regent, and established an influence which rendered his kingdom secure on that side. In the following year Henry made peace with France on condition of his retaining Tournay, and receiving a large payment of money, part of which was to be returned as a portion, with the princess Mary, Henry's sister, whom Lewis espoused, notwithstanding a great inequality of age. That king survived his marriage only three months, and his widow afterwards united herself to the duke of Suffolk, her brother's principal favourite. Henry set no bounds to the confidence reposed in Wolsey, and heaped upon him, with a most lavish hand, all sorts of dignities and honours, productive also of immense revenues. At length he made him his high chancellor. The ambition of this priest kept pace with the honours bestowed on him; and while apparently subservient to the will of the king, his influence directed all and governed all. Francis I. had succeeded to the crown of France, and was disposed to employ every method for his own aggrandisement. His first neglect of Wolsey produced hostilities from the emperor Maximilian, influenced, it was thought, by English gold. Francis saw his error, and determined, if possible, to gain the friendship of Henry. By proper applications to Wolsey he induced him to persuade his master to resign, for a sum of money, the conquest of Tournay, and enter into an amicable correspondence. In 1520 the two kings met between Guisnes and Ardres, the magnificence of which assembly gave the place the name of "the field of the cloth of gold." Though Francis used all his address to ingratiate himself with the English king and minister, yet a preponderancy was given to the interests of the English councils. The sacrifice of the duke of Buckingham to the enmity of Wolsey, on a charge of high treason, while it was a further proof of the minister's influence, aggravated that general odium under which he began to labour. At this period the principles of the reformation were making progress, to the great alarm of the votaries of the Roman Catholic church. Ambitious of glory of every kind, Henry wrote a book against the tenets of the reformer, which he presented to pope Leo X. and was, in return, honoured with the title of "Defender of the Faith," which is still preserved by his Protestant successors. Luther published a reply, in which he treated his antagonist with very little ceremony. Henry's attachment to the Roman see was of no long duration; for, having conceived an affection for Ann Boleyn, he determined to divorce Catharine, to whom he had been married 18 years. His plea for the divorce was, that Catharine was his brother Arthur's widow. The pope refused to grant him his wishes, and Henry, stung with the refusal, married privately, and assumed the title of Supreme Head of the English church, put down all monasteries, and alienated their possessions to particular purposes. Thus was effected the great revolution which has distinguished this reign in the annals of ecclesiastical history, and made it the commencement of an era of comparative light and reason. Though Henry had given so great a blow to the power of the Romish church, it was not his intention to discard its theological system; and he displayed a rooted aversion from the principles of the reformers by favouring a persecution which brought several of them to the stake. Fisher and More, both learned, wise, and pious characters, were the victims of his malignant cruelty. From this period the reign of Henry VIII. is that of a stern tyrant, who sacrificed, without scruple, every obstacle to his capricious will. The new queen, who was attached to the opinions of the reformers, fell under the suspicion of infidelity to her husband; and by means of the ill offices of her enemies, she was sent to the Tower, tried, and convicted. All attempts to save her life were in vain, and her fate was hastened by the king's passion for Jane Seymour, whom he married the day after Anne Boleyn was executed. In 1537 Henry was delighted with the

the birth of a male heir; but his joy was allayed by the death of his queen ſoon after delivery. It was not till the year 1538 that the ſuppreſſion of the religious houſes was completed. The king's indignation fell particularly upon Thomas à Becket, the ancient aſſertor of eccleſiaſtical againſt royal authority. He not only pillaged the rich ſhrine, but cited himſelf into the court, had him condemned as a traitor, expunged his name from the calendar, and burnt his bones to aſhes. It had been well if the tyrant had been content with abuſing the dead; but the weight of his royal power fell upon Lambert, an unoffending ſchoolmaſter, who was accuſed of hereſy, and who was tied to a ſtake, and burnt alive, with circumſtances of unuſual cruelty. Soon after a committee of parliament was appointed to draw up articles for uniformity of religion. The act enforcing them was called the Bloody Bill, on account of its ſeverity to Proteſtants; for, by the firſt article, the denial of the real preſence ſubjected a perſon to the fire, even without the privilege of abjuration. The ſervility of the parliament laid the civil and religious liberties of the nation alſo at the king's feet; for an act was paſſed, giving to the royal proclamations all the force of the ſtatute law. Henry next married Anne of Cleves, daughter to the duke of that name, a prince of great influence with German Proteſtants; but as ſhe did not prove agreeable to the king's expectations, he put her away, and cauſed Cromwell, earl of Eſſex, the projector of the match, to be beheaded. He then married Catharine Howard, niece to the duke of Norfolk, who proved unfaithful to him, and was beheaded for adultery. This marriage put him into the hands of the Catholics, and a rigorous perſecution was carried on againſt the Proteſtants. When the queen's infidelity was diſcovered, the king inſiſted that his complying parliament ſhould make it high treaſon for any woman, whom the king might hereafter marry, to paſs herſelf for a virgin, not being ſuch. In 1543 Henry took his ſixth wife, Catharine Par, widow of lord Latimer, a lady of much merit, and inclined to the reformation; and, in the following year, he regulated the ſucceſſion to the crown by a bill in parliament, declaring his ſon Edward, and any future male iſſue, his immediate heir, and after them the princeſſes Mary and Elizabeth, who were thus legitimated. He was now anxious to ſettle the religion of the country, and obtained ſuch powers from parliament as rendered his will the ſole authority in this point. Archbiſhop Cranmer was obnoxious to the Catholic party on account of his hereſy; and his ruin was only prevented by the perſonal eſteem and friendſhip of the king. The queen was in ſimilar danger, and articles of impeachment were actually ordered to be drawn up againſt her; but, being timely warned of her danger, ſhe found means, by artful humility and ſubmiſſiveneſs, to remove her huſband's ſuſpicions, and regain his favour. Diſeaſe aggravated the violence of Henry's paſſions. The duke of Norfolk, and his ſon, the earl of Surrey, fell under his diſpleaſure. They were arreſted, and the latter convicted, on ſcarcely any evidence, of high treaſon, and executed. The duke eſcaped by the approaching end of the king; but, till the laſt ſtage of his illneſs, he was anxious that his old ſervant ſhould be purſued, without evidence, to death. When Henry was informed that his end was nearly arrived, he deſired that Cranmer might be ſent for; but before he could come the king was ſpeechleſs, and could only, by preſſing his hand, give token of his dying faith. He expired on the 28th of January 1547, in the 38th year of his reign, and 56th of his age. The abſolute and uncontrolled authority which he maintained at home, and the regard which he acquired among foreign nations, are circumſtances which entitle him in ſome degree to the appellation of a great prince, while his tyranny and barbarity exclude him from the character of a good one. He poſſeſſed great vigour of mind, which qualified him for exerciſing dominion over men, courage, intrepidity, vigilance and inflexibility. A catalogue of his vices would comprehend many of the worſt qualities incident to human nature: but he was not altogether deſtitute of virtues. He was open, ſincere, gallant, liberal, and capable at leaſt of a temporary friendſhip and attachment. He never was the object of his people's hatred; and he may be ſaid in ſome degree to have poſſeſſed to the laſt their love and affection.

This vindictive and voluptuous monarch had ſtudied muſic very ſeriouſly in his youth, according to lord Herbert of Cherbury, who tells us in his life that "his education was accurate, being deſtined to the archbiſhopric of Canterbury, during the life of his elder brother, prince Arthur. By theſe means, not only the more neceſſary parts of learning were infuſed into him, but even thoſe of ornament, ſo that beſides being an able Latiniſt, philoſopher, and divine, he was (which one might wonder at in a king) a curious muſician; as two entire maſſes compoſed by him, and often ſung in his chapel, did abundantly witneſs." And Burnet, though he denies, in his Hiſtory of the Reformation, part i. p. 11. that Henry was ever intended for the church, yet allows that he was better educated than any other prince had been for many ages; and that he was "a good muſician, as appears by two whole maſſes which he compoſed;" but adds, that "he never wrote well, but ſcrawled, ſo that his hand was ſcarcely legible."

Hollinſhed likewiſe (Chron. iii. 806.) informs us, in deſcribing the manner in which Henry employed his time, during his progreſs from one palace to another, that "he exerciſed himſelf daylie in ſhooting, ſinging, dancing, wreſtling, caſting of the barre, plaieing at the recorders, flute, virginals, in ſetting of ſonges, and making of ballades."

The attention that was paid to choral muſic during the reign of this prince, before his breach with the Roman pontiff, may be collected from a ſet of regulations given to the royal houſhold about the year 1526 by cardinal Wolſey; in which it is ſaid, that "when the king is on journies or progreſſes, only ſix ſinging boys, and ſix gentlemen of the choir, ſhall make a part of the royal retinue; who daylie in abſence of *the reſidue* of the chapel, ſhall have a maſſe of our ladie before noon, and on Sondaies and holidaies, maſſe of the daie, beſides our lady-maſſe, and an anthempne in the afternoon: for which purpoſe, no *great carriage* of either veſtments or bookes ſhall require."

It is generally allowed that Henry could not only perform the muſic of others, but was ſufficiently ſkilled in counterpoint to compoſe the pieces that go under his name. See an anthem in Boyce's collection. He was likewiſe author of a motet, of which Dr. Hayes of Oxford was in poſſeſſion of a genuine copy.

Henry was doubtleſs a judge and encourager of the muſical art; and had, beſides the houſhold band on the eſtabliſhment, according to the ancient cuſtom of our ſovereigns, ſupernumerary muſicians in his ſervice; as we find in Rymer's Fœdera a grant to William Betum of 20*l.* ſterling per annum, A.D. 1537, and another grant of 50*l.* per annum to the eldeſt of four brothers, muſicians, of the name of Baſam, 1540. The ſecond had 2*s.* 4*d.* per diem, and the two youngeſt 20*d.*

The fluctuating ſtate of religion in England, during this turbulent reign, was ſuch as muſt have kept the inhabitants in perpetual terror both for ſoul and body; as what was ordered under ſevere pains and penalties to be practiſed and believed as neceſſary to ſalvation at one period, at another

was

was pronounced illegal, heretical, and damnable. Muſic in the church, however, appears to have undergone no other change at this time than in being applied in ſome parts of the ſervice to the Engliſh inſtead of the Latin language; but though choral muſic was not much affected by the ſmall progreſs that was made in the reformation under this prince, yet it was in frequent danger of utter abolition by the violence of the times, and fanaticiſm of the moſt furious reformers.

After Henry's breach with the Roman pontiff, ſeveral ſlight alterations were made in the liturgy, yet ſtill the ſervice was in Latin, and ſung in the uſual manner.

The king's Primer, in Engliſh, was publiſhed in 1535.

In 1536, Tyndal's tranſlation of the whole bible was not only printed, but ordered to be received into churches.

In 1538, a folio tranſlation of the bible was ordered to be had in every church; this was Tyndal's, with a few alterations by Coverdale.

In 1539, the Bloody Act, or Six Articles of Convocation, paſſed; and in the ſame year, a book of Ceremonies was publiſhed, in which is the following paſſage favourable to choral muſic: "The ſober, diſcrete, and devout ſinging, muſic, and playing with organs, uſed in the church, in the ſervice of God, are ordained to move and ſtir the people to the ſweetneſs of God's word, the which is ther ſung: and by that ſweet harmony both to excite them to prayer and devotion, and alſo to put them in remembraunce of the heavenly triumphant church, where is everlaſting joy, continual laud, and praiſe to God."

Henry, prince of Wales, and the eldeſt ſon of James I. was born at Stirling in 1594. He was an amiable and accompliſhed prince, and a great patron of learning. He died in 1612 to the grief of the nation, which had formed of him the higheſt expectations.

Henry of Huntingdon, an Engliſh hiſtorian, canon of Lincoln, and archdeacon of Huntingdon, flouriſhed in the 12th century. He wrote a hiſtory of England to the year 1154, which was publiſhed in 1576.

Henry, duke of Viſeo, fourth ſon of John I. king of Portugal, was born in 1393. In very early life he ſhewed an ardent attachment to the ſtudy of mathematics and coſmography, which was encouraged by his father, who provided for him the beſt maſters of the age. He had a paſſion for glory and naval enterpriſe, and ſerved with diſtinction at the reduction of Ceuta, and in other engagements in Africa, and was made by his father commander in chief of the Portugueſe forces in that country. He ſent out, while he was a very young man, a veſſel upon a voyage of diſcovery, which reached Cape Bojador, and its ſucceſs cauſed him entirely to devote himſelf to that object. Near Cape St. Vincent, in Algarve, he obſerved a commodious ſituation for a ſea-port, and there built his town of Sagrez, which, in its plan and fortifications, ſurpaſſed any other in Portugal. He erected arſenals, made docks and yards for ſhip-building, extended the uſe of the compaſs, and determined the modes of aſcertaining the longitude and latitude by aſtronomical obſervations. In 1418 he attempted to double Cape Bojador, but failed, and proceeded only to an iſland which he named Puerto Santo. In the next year his people diſcovered Madeira: in 1434 one of his captains paſſed Cape Bojador, and in the following year he carried his diſcoveries conſiderably farther. In 1442 another of his captains brought back from the coaſt of Africa ſome Guinea negroes, and a quantity of gold-duſt. This occaſioned the eſtabliſhment of a trading company under the auſpices of the prince. The diſcovery of the Azores took place in 1448, and in 1449 the prince's fleets diſcovered the Cape Verde Iſlands, and coaſted ſixty leagues beyond the Cape. Henry received every aſſiſtance in his darling project from the court of Portugal; but at length a miſunderſtanding, between his brother Don Pedro and his nephew, king Alonzo V. threw obſtacles in his way. He went to court in order to protect his brother; but, failing in his purpoſe, he returned to the town of Sagrez, where he finiſhed his uſeful life about the year 1460. He was, ſays the hiſtorian, one of the greateſt characters that his country ever produced, and may be regarded as the author of all the commercial proſperity to which Portugal attained by her Eaſt Indian poſſeſſions.

Henry, Nicholas, was born at Verdun in the year 1692, but nothing more than this is known of him till he was tutor to the ſons of M. Joly de Fleury, attorney-general to the parliament of Paris. In 1723 he was appointed Hebrew profeſſor in the college royal; and ſhortly after gave a new edition of Vatable's "Biblia Sacra," in two volumes folio, with additional notes. He was very converſant with the hiſtory of his own country, and left behind him ſome curious diſquiſitions relative to the public rights of the French, with a particular reference to the reigns of Philip-Auguſtus, Lewis VIII., and St. Lewis. He was accidentally killed by the fall of a building in 1752, when he was in the ſixtieth year of his age. Moreri.

Henry, Matthew, was born at Broad-Oak, in Flintſhire, in the year 1663. His father, Mr. Philip Henry, was a clergyman of conſiderable learning, and greatly eſteemed for his piety. He was one of the ejected miniſters who choſe rather to quit their livings than abandon the rights of conſcience. His ſon Matthew, the ſubject of this article, was educated at home, and made very conſiderable progreſs in all the branches of learning at that time taught. When he was about eighteen years of age he was ſent to an academy for the education of young perſons for the miniſtry, which was under the ſuperintendance of Mr. Doolittle at Iſlington, where he purſued his ſtudies with much ardour. Here he continued only two years, when his tutor was compelled, by the perſecuting ſpirit of the times, to diſmiſs his pupils. In 1685 Mr. Henry went to Gray's Inn, London, with the intention of ſtudying the law, but the real bent of his mind was for theological purſuits, and here he promoted meetings for the purpoſes of Chriſtian devotion and the ſtudy of the ſcriptures. Having been little more than a year in London, he returned to his father's, and began to preach whenever an opportunity occurred. His ſervices were generally acceptable, and he was ſoon invited to ſettle as paſtor with a congregation of diſſenters at Cheſter, with which he complied. After a reſidence of twenty-five years at Cheſter, he removed to Hackney, where his labours as a preacher in that village, and in London, were almoſt inceſſant. He died at Nantwich, in Cheſhire, in 1714, as he was returning from a viſit to his old congregation. He was only in the fifty-ſecond year of his age, and his death was univerſally lamented among his friends, and the diſſenters at large. His great work as an author was "Expoſitions on the Bible," in five volumes folio, of which four contain the Old Teſtament, and the fifth the Evangeliſts and the Acts of the Apoſtles. Another volume, had he lived to complete it, would have accompliſhed his plan, but he died before he had given the expoſition to the Romans. It was afterwards finiſhed by Dr. Evans. This work has been frequently reprinted, and is now a ſtandard book with the Calviniſtic party. He was author of many other ſmaller works, of which his "Catechiſms" and "Method of Prayer" are the moſt popular.

Henry, Robert, was ſon of a farmer at Muir-town, in the pariſh of St. Ninians, Scotland, where he was born in 1718.

1718. Having gone through a courſe of ſchool learning, he went to purſue his maturer ſtudies at the univerſity of Edinburgh. He afterwards became maſter of the grammar ſchool of Annan, and in 1746 was entered a licenſed preacher in the church of Scotland. He accepted an invitation to officiate as paſtor to a congregation of diſſenters at Carliſle, in which ſituation he continued 12 years, when he removed in 1760 to a ſimilar ſtation at Berwick-upon-Tweed. Here, to an aſſiduous diſcharge of the duties of his office, he united the cultivation of general literature. About the year 1763 he turned his thoughts to the compoſition of an extenſive hiſtory of England on a new plan. He ſoon found it impoſſible to carry on his reſearches at ſuch a place as Berwick, which was the principal reaſon for his removal, in 1768, to Edinburgh, where he was appointed miniſter to the New Grey Friars church. After a few years, he exchanged this for the old church, which he ſerved the reſt of his life. The degree of doctor of divinity was conferred on him in 1770, and in 1774 he was choſen moderator of the general aſſembly of the church of Scotland. In 1771 he publiſhed the firſt volume of his hiſtory in quarto; this was followed by four others at different periods between the former year and 1785. The plan of Dr. Henry is to throw the ſeveral topics of hiſtorical information in ſeparate chapters, ſeven in number, all of which are ſynchronous in their period, and each treats of its reſpective ſubject detached from the reſt. The *firſt* chapter in each book contains the civil and military hiſtory of Great Britain; the *ſecond* contains the hiſtory of religion; the *third*, the hiſtory of the conſtitution, government, laws, &c.; the *fourth* comprehends the hiſtory of learning, learned men, and ſeminaries of learning; the *fifth*, the hiſtory of the arts; the *ſixth*, the hiſtory of commerce, money, coin, &c.; and the *ſeventh*, the hiſtory of the manners, &c. of the people of Great Britain. The plan was really new, and it excited much malignant criticiſm from a party of his countrymen, who did what they could to write it down, but he went on ſteadily, and at length eſtabliſhed its reputation, and obtained a very conſiderable ſum as an author's profit. The earl of Mansfield, to whom the octavo edition of the work is dedicated, thought ſo highly of its merit, that he procured from his majeſty, in the year 1781, a penſion of 100*l.* per annum for the author, which he enjoyed till his death. This hiſtory was the principal object of Dr. Henry's attention for almoſt thirty years of his life. His health began to decline as ſoon as he had publiſhed his fifth volume in 1785, but he was not diſabled from purſuing his ſtudies till the ſummer 1790. He died in the following November, in the ſeventy-third year of his age. He bequeathed his books to the magiſtracy of Linlithgow, as the foundation of a public library in that town. Dr. Henry's private character was amiable; he was fond of ſociety; much attached to his friends, and ever ready to perform offices of kindneſs. The five volumes of his "Hiſtory" publiſhed in his life-time, carried the ſubject down to the acceſſion of Henry VII. A ſixth volume, which he had prepared for the preſs, and which concludes the reign of Henry VIII. was publiſhed in 1793, with a life of the author prefixed, from which, and the preface to the hiſtory, the foregoing facts are taken.

HENRY, in *Geography*, a mountainous county of Virginia; bounded N. by Franklin, S. and S.E. by Patrick, S.W. by Griſon, and N.W. and W. by Montgomery. It is about 40 miles long, and 15 broad; and contains 3844 free inhabitants, and 1415 ſlaves.—Alſo, a county of Kentucky, containing 3258 inhabitants, of whom 406 are ſlaves.—Alſo, a cape which is the N.E. extremity of Princeſs Ann county in Virginia, 12 miles S. by W. of cape Charles in Northampton county. Theſe capes form the entrance of Cheſapeak bay. Cape Henry lies in N. lat. 37°. W. long. 76° 16'.

HENRY, *Cape*, is alſo a cape on the W. coaſt of Queen Charlotte's iſland in the N. Pacific ocean. N. lat. 52° 53'. E. long. 227° 45'.

HENSDALE, a town of America, in the ſtate of New Hampſhire; 70 miles W.N.W. of Boſton.

HENSHAW's TOWN, a town of Africa, in Calbari. N. lat. 5° 27'. E. long. 7° 52'.

HENSIN, or HENSINGEN, a town of France, in the department of the Foreſts; 12 miles E.N.E. of Bouillogne.

HENSLOW CAPE, a cape on the S. coaſt of New Georgia. S. lat. 10°. E. long. 160° 38'.

HENTINGS, in *Agriculture*, a term uſed by the farmers for a particular method of ſowing before the plough; the corn being caſt in a ſtraight line juſt where the plough is to come, is by this means preſently ploughed in. By this way of ſowing they think they ſave a great deal of ſeed and other charges, a dextrous boy being as capable of ſowing this way out of his hat, as the moſt ſkilful ſeeds-man. Plott's Hiſt. Oxfordſhire, p. 251.

HENTING is alſo a term uſed by the ploughmen, and others, to ſignify the two furrows that are turned from one another at the bottom, in the ploughing of a ridge. The word ſeems to be a corruption of *ending*, becauſe thoſe furrows make an end of ploughing the ridges. The tops of the ridges they call veerings.

HENWEED, GUINEA, in *Botany*. See PETIVERIA.

HENZUAN. See JOANNA.

HEORDPENNY, in our *Old Writers*, the ſame with what at firſt was called *Romſcot*, and afterwards *Peterpence*.

The word is Saxon, from *heorth*, *focus*, a *hearth*, and *penning*, *denarius*, a *penny*.

HEP, or HIP, in *Botany*. See ROSA *Canina*.

HEPS, or *Hips*, *Conſerve of*, in the *Materia Medica*. See CONSERVE.

HEPAR, in *Anatomy*. See LIVER.

HEPAR, in *Chemiſtry*. See LIVER.

HEPAR, *Sulphuris*. See SULPHURET.

HEPAR *Uterinum*, the ſame with placenta.

HEPATALGIA, in *Medicine*, from ἧπαρ, *hepar*, the *liver*, and ἄλγος, *pain*, a term employed by the noſologiſts to denote thoſe chronic diſorders of the liver, which are accompanied with pain in that organ.

In the ſyſtem of Sauvages this conſtitutes a genus, which is ſub-divided into eight ſpecies, according to the modification of the diſeaſe in the liver, which gives riſe to the pain. Hence we have (ſpecies 1.) Hepatalgia *calculoſa*, originating in the violent diſtention of the biliary ducts, occaſioned by the paſſage of a biliary concretion or calculus. 2. H. *ſcirrhoſa*, connected with a ſcirrhous ſtate of the liver. 3. H. *infarctus*, from obſtruction in that organ, the *Hepatis infarctus* of Juncker and others. Among the other ſpecies are alſo Hepatalgia *ſarcomatoſa*, and *apoſtematoſa*, ariſing from a fleſhy growth, or mere enlargement of the liver in the one caſe, and an abſceſs in its ſubſtance in the other. (See Sauvages Noſol. Method. claſs vii. genus 23. alſo the ſyſtem of Sagar.) But as the pain in the region of the liver, in ſuch caſes, is only one among the many ſymptoms, which accompany theſe various derangements of the organ, we ſhall refer the whole to one head. See LIVER, *chronic diſeaſes of the*.

HEPATIC, in *Anatomy*, from *hepar*, the liver, the epithet by which various parts belonging to the liver are deſcribed,

ſcribed, ſuch as its artery, veins, excretory duct, and nerves. See LIVER.

HEPATIC *Air*. See SULPHURETTED HYDROGEN GAS.

HEPATIC *Aloes*. See ALOES.

HEPATIC *Duct*, is a veſſel more uſually called *porus bilarius*.

HEPATIC *Flux*, *fluxus hepaticus*, or *hæpatirrhœa*, in *Medicine*, denominations given by the older writers, upon hypothetical grounds, to a variety of diarrhœa, in which watery ſtools, coloured with ſome blood, are diſcharged without fever, and commonly without pain. Juncker, Sauvages, &c. See DIARRHŒA.

HEPATIC *Ple us*. See PLEXUS *hepaticus*.

HEPATIC *Vein*, is that otherwiſe called *baſilica*.

HEPATICA, in *Botany*, ſee ANEMONE. It was ſo called becauſe the ſmooth three-lobed and dull-purpliſh leaf was thought to convey ſome idea of the human liver. Dillenius made it a diſtinct genus, on account of the three-leaved calyx; which, however, being a little remote from the flower, was taken by Linnæus for an *involucrum*, as an undoubted ſpecies of *Anemone*, and not a *perianthium*.

Hepatica alba is an old name for the *Parnaſſia paluſtris*; and *H. paluſtris* was once an appellation of the *Chryſoſplenium*.

Hepatica is alſo the old name of the *Lichen* of *Dillenius*, *Marchantia* of Linnæus, ſuppoſed to be good for diſeaſes in the liver; ſee MARCHANTIA. Hence the term has recently been adopted to deſignate a newly-eſtabliſhed order of plants, to which that genus belongs. See HEPATICÆ.

HEPATICA, in *Gardening*, the common name of a tuberous-rooted flowering plant. See ANEMONE.

HEPATICÆ, in *Botany*, a natural order of the cryptogamic claſs of vegetables; ſee HEPATICA. Hoffmann, in his Fl. Germ. v. 2. 81, defines the vegetables of this order as *ecalyptrata*, deſtitute of the hood or veil which is proper to moſſes, and which is elevated from its torn baſe by their ripening capſules. This is incorrect, for the *calyptra* is preſent in the *Hepaticæ*, only not raiſed up with the capſule, but burſting at the top to let it paſs, as is properly expreſſed in Schreber's Gen. Pl. 750. In the *Flora Britannica*, the order in queſtion is thus defined.

Herb frondoſe (conſiſting of leaf and ſtem united). Capſules deſtitute of an operculum.

There is ſome difficulty with regard to the firſt part of this character in the genus *Jungermannia*, ſome of which are indeed as truly frondoſe as any of the order, but the greater part have a diſtinct ſtem, with leaves, and even ſtipulas, at leaſt in appearance. We nevertheleſs are inclined to perſiſt in the above definition, and to conſider the herbage of every *Jungermannia* as a frond, the ſuppoſed leaves being only ſegments or leaflets thereof, and the ſtipulas mere acceſſory ſcales, as in Ferns. In defence of this idea, it muſt be obſerved that the apparent leaves and ſtem are always of one homogeneous cellular texture, perfectly united or continuous, and that there is never any ſolution of continuity between thoſe parts, like the fall of the leaf in other plants, at any period of their growth.

The genera of this order, all Britiſh, ſtand thus in Schreber. *Marchantia*, *Jungermannia*, *Targionia*, *Anthoceros*, *Blaſia*, *Riccia* and *Sphærocarpus*.

Their habit is nearly of the ſame vaſcular, or reticulated, reviveſcent nature as that of moſſes. The preciſe mode of their fructification or impregnation is ſcarcely at all underſtood. The internal ſtructure, and arrangement of parts, of their fruit, is often very peculiar and elaborate, chiefly tending, as it ſeems, to the diſperſion of their ſeeds, by means of elaſtic or hygrometric fibres.

HEPATIS INFARCTUS, in *Medicine*, ſignifies, in the language of the older writers, an obſtruction or congeſtion of blood in the liver, and is ſynonymous with the Hepatalgia infarctus of Sauvages, above mentioned. See *Chronic Diſeaſes of the* LIVER.

HEPATITIS, from ἧπαρ, *hepar*, *the liver*, with the termination *itis*, ſignifies inflammation of the liver.

The liver, like moſt other parts of the body, is liable to inflammation under two forms, the *acute* and the *chronic*; and it has generally been ſuppoſed that theſe varieties of diſeaſe conſiſt, in fact, of a difference in the ſeat of the inflammation. Some phyſicians have ſuggeſted that the inflammation is of the acute form, when the enveloping membrane of the liver is affected; and of the chronic form when the parenchyma, or ſubſtance of the organ itſelf is inflamed. (See Dr. Cullen's Firſt Lines, § 418.) While others have conceived, that the acute inflammation appears, when the extremities of the hepatic artery are particularly affected; and the chronic, when the branches of the hepatic vein, or *vena portæ*, which conveys the principal portion of blood to the liver, is the ſeat of the morbid action. (See Dr. Saunders, on the Structure and Diſeaſes of the Liver, chap. iv. p. 259. 3d edit., &c.) Of the laſt ſuppoſition, Dr. Cullen thinks that there is neither evidence nor probability: and we may add, that, as the two analogous forms of inflammation occur in other organs, as in the lungs, and the ſtomach, in which the whole circulation is conveyed by one ſet of veſſels, the difference in the ſeat of the inflammation, as ſtated by Dr. Cullen, appears to be the more probable cauſe of the difference of the ſymptoms. It is of more importance to know, that the two forms of diſeaſe are diſtinguiſhed by certain ſeries of phenomena, which are not eaſily confounded with each other: thoſe of the acute inflammation of the liver, or *hepatitis* ſtrictly ſo called, we ſhall here deſcribe; the chronic form will be found, with the other chronic derangements of this organ, under the article LIVER, *Chronic Diſeaſes of*.

The acute hepatitis generally commences with ſome degree of chilline's or ſhivering, which, in ſome caſes however, is ſo ſlight as to eſcape the attention or recollection of the patient; to theſe follow an increaſe of heat, and quickneſs of the pulſe, and pain in the region of the liver. Sometimes it begins at once with a pungent pain in this part, or the right hypochondrium, which is felt alſo along the margin of the ribs, ſhooting to the top of the right ſhoulder, or to the back and ſhoulder blade. This pain, which is more or leſs acute, is very often in ſuch a part of the ſide as to make it appear like that of a pleuriſy; and like that, too, it is often increaſed on inſpiration, the preſſure of the diaphragm, in this caſe, affecting the inflamed viſcus. This occurs more particularly, when the inflammation is ſeated in that part of the ſurface of the liver, which lies in immediate contact with the diaphragm. The diſeaſe is alſo often attended with a cough, which is dry and irritating, under the circumſtance laſt-mentioned; but is ſometimes looſe, with a free expectoration from the lungs, ariſing probably, as Dr. Pemberton ſuggeſts, (ſee his Practical Treatiſe on the Diſeaſes of the Abdominal Viſcera, p. 20.) from the general inflammatory diatheſis. When the pain thus reſembles that of pleuriſy or peripneumony, the patient lies moſt eaſily upon the ſide affected. If the inflammation attack the convex ſurface of the liver, ſo that the peritoneum becomes affected, the pain is much increaſed by external preſſure, and ſome degree of tumour may be obſerved. The tongue is generally covered with a white cruſt, and, together with the mouth and throat, is extremely dry. The urine is ſecreted in ſmall quantity, is high-coloured, and frequently tinged with bile.

Many

Many practical writers have mentioned jaundice, or yellow colour of the ſkin and eyes, as a very conſtant ſymptom of hepatitis: but, although it is not an uncommon ſymptom of the diſeaſe, it is by no means a neceſſary conſequence of it; ſince the paſſage of the bile into the duodenum will continue open and free, when the inflammation is confined to the convex ſurface of the liver, or other parts not immediately in the vicinity of the gall-ducts. There is commonly no nauſea connected with hepatitis; but occaſionally the ſtomach is ſo exceedingly irritable, that violent retching or vomiting occurs; which Dr. Cullen aſcribes to the communication of a degree of inflammation to the ſtomach, when the diſeaſe is ſeated in the concave ſurface of the liver; in which caſe, alſo, it may be readily communicated to the gall-bladder ducts, as juſt hinted; the only circumſtance, Dr. Cullen believes, under which idiopathic hepatitis is attended with jaundice.

Hepatitis, like other inflammations, may terminate in reſolution, ſuppuration, and abſceſs, and perhaps in gangrene; or it may lead to chronic induration or ſcirrhus of the liver.

The reſolution of hepatitis is often accompliſhed by an early and judicious employment of the remedies to be enumerated immediately. In ſeveral inſtances it has been the conſequence of, or attended with, various ſpontaneous evacuations. Sometimes a hemorrhage from the right noſtril, and ſometimes from the hemorrhoidal veſſels, has been obſerved to precede the ſolution of the diſeaſe; ſometimes a bilious diarrhœa has contributed to the ſame event; and ſometimes a free ſweating, or an evacuation of urine, depoſiting a copious ſediment, has accompanied the reſolution of this, as of other inflammations. And, occaſionally, it would ſeem that a copious expectoration of mucus from the lungs has aſſiſted in producing this reſolution, by diminiſhing the general inflammatory diatheſis. An eryſipelatous inflammation, appearing on ſome external part, has likewiſe appeared to cure this diſeaſe; and it is not improbable that a ſuperficial diſcharge of coagulable lymph has promoted its reſolution, although productive of adheſion to the neighbouring parts. The influence of ſeveral of theſe diſcharges, however, has probably been magnified by the humoral pathologiſts.

If the ſymptoms of fever and local pain do not abate, but, on the contrary, continue violent, or increaſe, for ſeveral days, ſuppuration will probably take place. The commencement of the formation of *pus* is indicated by a diminution of the pain, (while the fever continues,) which is ſucceeded by a ſenſe of weight and oppreſſion in the right hypochondrium, with a throbbing or pulſation, eſpecially when lying on the left ſide. There are alſo frequent rigors or ſhiverings, as the formation of matter proceeds, and an acceſſion of fever towards evening, with fluſhings of the countenance, and a propenſity to profuſe night-ſweats, and other ſymptoms of hectic.

The matter, which is collected in the abſceſs thus formed, continues to accumulate, until it makes its way to one part or another of the ſurface of the liver; it may, therefore, be diſcharged in various ways, more eſpecially if the exudation of coagulable lymph, before mentioned, ſhall have occaſioned an adheſion of the ſurface of the liver to the contiguous parts; and ſuch adheſive proceſs is a common attendant upon thoſe of ſuppuration and ulceration.

Thus when the diſeaſe is ſeated on the convex ſide of the liver, ſome degree of external tumour appears, and a fluctuation may be perceived; and if the adheſion be to the peritoneum lining the common integuments, the pus may make its way through theſe, and be diſcharged outwardly, with or without the aſſiſtance of the ſurgeon, and the patient may recover. If, again, the adheſion ſhould be to the diaphragm, the *pus* may penetrate this muſcular partition, and be diſcharged into the cavity of the thorax, where it will compreſs the lungs, and moſt probably prove fatal. But it has ſometimes happened, that the inflammatory action has pervaded the diaphragm and the contiguous portion of the lung; ſo that the diaphragm has formed an adheſion with the liver on one ſide, and with the lung on the other; in which caſe, the abſceſs of the liver has opened into the cells of the lungs, and the *pus* has been diſcharged by coughing and expectoration. Again, the matter may be evacuated into the inteſtines or ſtomach, and paſs off by ſtool or vomiting, in two ways, when its ſeat is in the concave part of the liver. For either the branches of the hepatic duct may be involved in the ſuppurative proceſs, in conſequence of which the pus will make its way through the duct into the duodenum, and will be diſcharged by the bowels, probably in a very ſlow manner, the aperture of communication being ſmall:—or an adheſion having taken place between the liver and the ſtomach or inteſtine, when the ulceration proceeds, ſo as to penetrate the adhering parts, the pus may be diſcharged into the ſtomach or the bowels. Under ſuch circumſtances, the patient frequently recovers, even after much emaciation and other very unpromiſing appearances had occurred. "Perhaps the moſt uſeful evacuation of hepatic abſceſſes," Dr. Saunders obſerves, "by the inteſtinal canal, is that where, an adheſion taking place between the ſuppurating part and the inteſtines, an ulceration enſues, and the contents of the abſceſs have a ready paſſage into the inteſtines. This may happen in different parts of the inteſtinal canal, according to the ſituation of the abſceſs. When it is ſeated at the concave part, the duodenum may be favourable for that purpoſe; but when the lower edge of the liver is the part concerned, the great arch of the colon is the uſual outlet; and in theſe caſes it is highly probable, from the ſcale of the parts concerned, that the opening of communication will be more extenſive, and the diſcharge of the matter more free."—When no adheſive inflammation has occurred, and the ſuppurated part of the liver does not cloſely adhere to any neighbouring organ, the pus may be diſcharged into the cavity of the abdomen, and will almoſt neceſſarily deſtroy the life of the patient.

It has not been clearly aſcertained, that inflammation of the liver terminates in mortification or gangrene. The author laſt quoted ſays, "I have ſeen ſome inſtances where the pain and inflammation have ſubſided very ſuddenly, and have been ſucceeded by a low fluttering pulſe, cold extremities, deliquium, and death: ſo that there has been reaſon to ſuſpect that this organ may, on ſome occaſions, though much leſs frequently than others, become gangrenous." (Loc. cit. p. 274.) See Morgagni, De Sedibus et Cauſis Morbor. epiſt xxxiv. art. 25, and Baillie's Morbid Anatomy, p. 213.

The ſtate of induration and ſcirrhus, in which we have ſaid that inflammation of the liver occaſionally terminates, is a more frequent conſequence of the chronic inflammation of the viſcus. See Liver, *Chronic Diſeaſes of*.

The diagnoſis of hepatitis is not always eaſy to be made, in conſequence of the vicinity of the organ diſeaſed to the diaphragm and lungs, as well as to the ſtomach; ſo that it is occaſionally miſtaken for inflammation of theſe organs, that is, for pleuriſy or peripneumony, and gaſtritis. It may likewiſe be miſtaken for ſpaſm of the gall-ducts, and for rheumatic affections of the muſcles in the neighbouring parts. From what we have already ſtated, it muſt be obvious that the leading ſymptoms of inflammation of the lungs and of

the liver are common to the two diſeaſes; namely, fever, pain of the ſide, and cough, with impeded reſpiration. This more particularly happens, when the membranous coat of the liver is inflamed in contact with the diaphragm. Sometimes, however, the inflammation actually extends to the diaphragm, and even to the contiguous portion of the lungs. In ſuch inſtances, as Dr. Baillie juſtly remarks, "it would be of little uſe to diſcriminate between thoſe diſeaſes in practice, becauſe the remedies to be employed in both are the ſame." (Loc. cit. p. 230.) Where the inflammation, however, is confined to the liver, and eſpecially in its ſubſtance, the following circumſtances of diſtinction between this and pulmonic inflammation, as pointed out by Dr. Pemberton, are worthy of attention. The difficulty, he thinks, will be in a great meaſure removed, "*firſt*, by remarking, that (in hepatitis) a gradual inſpiration does not produce cough, although it increaſes the pain: *ſecondly*, that the pain is increaſed by gentle preſſure under the margin of the ribs, which would not be the caſe if the inflammation was within the cheſt; and *thirdly*, that the cough, (if it is preſent,) is found to have *ſucceeded* the pain ſeveral days, and not to have *preceded*, or to have been *coeval* with it, as in pleuriſy." (Loc. cit. p. 21.) To this it may perhaps be added, that the pain in pleuriſy is much aggravated, when the patient attempts to lie on the affected ſide; whereas, in hepatitis, he can frequently lie moſt eaſily on the ſide diſeaſed; that the pain in the top of the ſhoulder, though not always preſent in hepatitis, is a frequent ſymptom of this diſeaſe; and, that the difficulty can ſcarcely exiſt, where there is any yellowneſs of the complexion or of the coats of the eye.

From *gaſtritis* the hepatic inflammation may be diſtinguiſhed by the abſence of that extreme ſenſe of heat and pain, with which the inflamed ſtomach is affected, eſpecially, after taking any thing whatever into it, as well as the great and ſudden ſickneſs which is occaſioned in the ſame way. (See Gastritis.) Nor is the proſtration of ſtrength ſo great in the inflammation of the liver as in that of the ſtomach.

In the caſe of *muſcular pain*, which is ſometimes very acute, affecting the diaphragm and intercoſtal muſcles, there is little or no fever; the pain is more diffuſed, frequently moves from one place to another, and is much influenced by changing the poſture of the body. Such pain, too, is commonly accompanied by, or alternates with, rheumatic pain in one or more joints or muſcular parts of the body.

From *ſpaſm of the gall-ducts* inflammation of the liver may be diſtinguiſhed, as Dr. Pemberton has ſtated, by there being no nauſea, by the pain being permanent, by the pulſe being upwards of one hundred in a minute, and by the patient always preferring to keep the body in a ſtraight quieſcent poſture; whereas the greateſt eaſe, when there is a ſpaſm of the gall-ducts, is obtained by bending the body forward on the knees.

Appearances on Diſſection after Death.—Dr. Baillie obſerves, that, when inflammation is confined to the membrane of the liver, it is not frequently extended over the whole of it, but more commonly takes place in that part which covers the anterior or convex part of the liver. But he adds, that he has alſo ſeen inflammation, or at leaſt its effects, not unfrequently on that ſide of the liver which is in contact with the ſtomach and duodenum. When inflammation takes place in the membrane of the liver, it exhibits the ſame appearances as the peritoneum and other membranous parts, when inflamed. It is crowded with a great number of very minute veſſels, which carry florid blood, and is thicker than in its natural ſtate. There is alſo thrown out upon its ſurface a layer of coagulable lymph; this layer is thicker on ſome occaſions than others, and often glues the liver more or leſs completely to the neighbouring parts. Theſe adheſions, as we have already ſtated, are of great uſe in preventing the pus from abſceſſes from eſcaping into the general cavity of the abdomen. Some quantity of ſerous fluid is alſo thrown out at the ſame time with this lymph. It does not often happen in this country, the ſame able phyſician remarks, that the ſubſtance of the liver is found in actual ſtate of inflammation. In warmer countries the ſubſtance of the liver is much more liable to inflammation than in England. When it is generally inflamed through its ſubſtance, it is found a good deal enlarged in ſize, and of a deep purple colour, probably from the great accumulation of blood in the vena portarum; it is alſo harder to the touch than in its healthy ſtate. Its outer membrane is ſometimes alſo affected with this inflammation, and ſometimes it is not. It is attended occaſionally with a jaundiced colour of the ſkin, ariſing from the bile not getting readily into the common duct, on account of the preſſure of the inflamed liver on the *pori bilarii*. When this inflammation has continued for ſome time, abceſſes are formed. Theſe are ſometimes of a large ſize, ſo as even to contain ſome pints of pus; ſometimes the whole of the liver is almoſt converted into a bag containing pus. (See Morbid Anatomy, p. 212.)

The cauſes of hepatitis are not always eaſily diſcerned, and ſome have been aſſigned on a very uncertain foundation: we ſhall confine our notice to thoſe which appear to be often ſatisfactorily aſcertained. With reſpect to the *predispoſition* to this diſeaſe, it has been obſerved moſt frequently in the male ſex, and not until the adult period of life. There is alſo a certain conſtitutional tendency to it, which appears to be connected with a plethoric habit, a tenſe irritable fibre, and a paſſionate temper. The exciting cauſes of hepatitis are partly all thoſe circumſtances which induce general inflammatory affections, and partly thoſe which occaſion excitement in the circulation of the liver. Among the former cauſes may be mentioned, (1ſt,) external violence from contuſions and falls, and eſpecially, as Dr. Cullen remarks, thoſe which have occaſioned a fracture of the cranium: (2) ſudden viciſſitudes of temperature, eſpecially the application of cold externally or internally; whence the ſame expoſure which produces pneumonic inflammation may alſo produce hepatitis, and whence alſo the two diſeaſes are ſometimes joined together. Among the latter claſs of cauſes we may notice (3) violent bodily labour or exerciſe; (4) violent paſſions of the mind, and particularly anger; the fact, that fits of anger augment the biliary ſecretion, ſeems to have been a matter of ancient obſervation; whence the epithet *choleric* is applied to thoſe who are much under the influence of that paſſion; but the moſt frequent exciting cauſes are perhaps (5) continued great heat of climate or ſeaſon, and (6) intemperance in the uſe of ſpirituous liquors. We have already ſtated the general and well-eſtabliſhed fact, that an increaſed ſecretion of bile is a frequent conſequence of the continued operation of external heat upon the human body (ſee Heat); and Dr. Saunders remarks, that the accelerated, though imperfect, ſecretion of bile, together with the ſenſe of fulneſs in the region of the liver antecedent to inflammation, tend to ſhew that hepatitis is generally preceded by congeſtion, p. 293. And it is well underſtood, that this condition is often produced by the abuſe of ſpirituous liquors. We ſhall not here enter into any detail of the hypotheſes which have been invented to explain theſe facts, as we deem them in a great meaſure gratuitous, and not tending to add any thing to our actual knowledge on the ſubject, or to improve our practical reſources.

Of the Cure of Hepatitis.—The firſt object of the phyſician, in

in the application of remedies for the cure of acute hepatitis, is to arreſt the inflammatory proceſs before that of ſuppuration has commenced, as in the caſe of inflammation in any other important organ of the body. For this purpoſe, every part of what is termed the *antiphlogiſtic* practice muſt be purſued; but it will require conſiderable attention and diſcernment to determine, according to the circumſtances of the caſe, to what extent this practice ſhould be carried, and at what period it is moſt uſeful, or ceaſes to be ſafe. For it muſt be obvious, that no conſiderable advantage can be expected from the practice, except in the early ſtage of the diſeaſe, when the inflammation has not advanced beyond the probability of reſolution; if the ſymptoms, indicating the commencement of the formation of pus, have already appeared, depletion muſt be reſorted to with much caution.

In the commencement of hepatitis, however, *blood-letting* muſt be conſidered as the moſt effectual method of ſubduing the inflammation, and ſaving the liver from the dangerous and deſtructive proceſs of ſuppuration. No general rule can be given reſpecting the quantity to be drawn, as this muſt depend upon the ſtrength, age, and previous health of the patient, upon the violence of the ſymptoms, the effect of the operation on the pulſe, and other circumſtances of each individual caſe. From an adult of unimpaired conſtitution, ſixteen or twenty ounces of blood may be taken from the arm, from a large orifice, from which it may flow in as ſhort a time as poſſible. This point, *viz.* the *ſudden* depletion of the blood-veſſels, has been obſerved to be of the utmoſt importance in the cure of inflammation from very ancient times, and cannot be too ſtrongly urged. When the blood trickles from a ſmall orifice in the vein, it contributes little to the relief of the inflammatory action, while it robs the patient of that vital fluid, which, in the latter ſtages of the diſeaſe, might tend to ſupport his ſtrength, and aid his convaleſcence.

As a guide, in determining the propriety of repeating the operation of blood-letting, the *buffy coat*, or cruſt of coagulated lymph, which appears on the blood drawn, when it cools, is much attended to. But it can only be deemed a ſafe guide in conjunction with the ſtate of the pulſe, the degree of pain, and other ſymptoms. For it often happens, as Dr. Pemberton has remarked, that the blood firſt drawn is not at all buffy; ſtill, however, ſhould the pain be equally acute, and ſhould the pulſe continue hard for eight hours after the former veneſection, we ſhould again order a like quantity to be taken away; and this blood will uſually ſhew the beginning buff. The following obſervations on this ſubject are important: "I am, with others, well aware," ſays the laſt mentioned author, "that the preſence or abſence of buff ought not *of itſelf* to decide our practice as to future bleeding, inaſmuch as the moſt trifling circumſtance in the *manner* of the blood's flowing will prevent its appearance altogether, even during active inflammation; yet, when it is preſent, I think that an attentive obſervation of its texture will materially aſſiſt us in deciding how far we may again venture upon general bleeding. If, for example, the buff, after ſix hours from the time of veneſection, appears very firm, compact, and opaque, has a concave ſurface, and is puckered at the edges; and if the hardneſs of the pulſe, and the degree of pain is not diminiſhed, we may feel ſecure that the patient will again bear with advantage a bleeding from the ſyſtem. If, on the contrary, the buff (after an equal time) appears with a flat ſurface, is ſemi-tranſparent, and has a greeniſh-yellow colour, with a ſtriated filamentous texture running through it, we muſt not again have recourſe to general bleeding, but place all our reliance on topical bleeding, bliſtering, and purging." (Loc. cit. p. 25.)

When the appearances of the blood, juſt alluded to, or the debility of the patient's conſtitution, forbid the repetition of general bleeding, and yet the inflammation is not ſubdued, the application of a number of leeches, or of cupping glaſſes (after ſcarification), or of a large bliſter, upon the region of the liver, ſhould be reſorted to. At all events, indeed, *bliſters* co-operate with the views of blood-letting; and, therefore, in attempting a reſolution of the inflammation, recourſe ſhould be had to them very early after the blood-letting. Dr. Saunders, and ſeveral other phyſicians, have recommended a quick ſucceſſion of bliſters to the vicinity of the inflamed organ, which they believe to be more efficacious in ſubduing the activity of the inflammation, than long protracted diſcharges from a ſingle veſication.

There is another part of the antiphlogiſtic treatment, which, although important in all diſeaſes in which this treatment is required, is particularly beneficial in the caſe of hepatic inflammation; we allude to the evacuation of the bowels by *cathartics*. For in this inflammation, purgatives operate almoſt directly upon the organ diſeaſed, and contribute to leſſen the diſtenſion of its veſſels, both by aiding the paſſage of the bile into the inteſtines from its ducts, and by procuring a determination of blood to the whole ſurface of the inteſtines, and thus preventing ſo large a quantity from paſſing on to the *vena portarum*, to diſtend the inflamed viſcus ſtill farther. It is deſirable, therefore, that a cathartic be immediately adminiſtered, at the time of the firſt bleeding, and the evacuation kept up by a repetition of it. Now, with reſpect to the nature of the cathartic, which may be moſt beneficially exhibited for this purpoſe, the moſt experienced practitioners are not altogether agreed. Dr. Saunders, Dr. Pemberton, and others, give the preference to ſaline purgatives; and Dr. Saunders thinks that their efficacy is not a little increaſed, by exhibiting them in a diluted ſtate, in which they not only ſeem to be more ſtrictly antiphlogiſtic, but are leſs liable to occaſion nauſea and other diſagreeable ſenſations in the ſtomach. Dr. Pemberton commences with a doſe of ſulphate of magneſia, or Epſom ſalt, in infuſion of ſenna, and keeps up the action of the bowels by giving a drachm of this ſalt, in infuſion of roſes or other aqueous vehicle, every three hours.

There are other practitioners, however, and among them a very intelligent phyſician of Guy's hoſpital, Dr. James Curry, who has had ample opportunities of treating hepatitis both in this country and in India, where it is almoſt endemic, who give a decided preference to mercurial purgatives, and eſpecially to calomel. In ſtating the grounds of this preference, in a letter to Dr. Saunders, (publiſhed by the latter, in the book to which we have ſo often referred,) Dr. Curry expreſsly attributes its efficacy, in the cure of hepatitis, to its qualities as an *evacuant*; for he accords with the opinion of the beſt writers, that the general action of mercury on the conſtitution, were it practicable with ſufficient ſpeed, would be injurious in the early and highly inflammatory ſtage of the diſeaſe. The ſuperior efficacy of this evacuant, he aſcribes to its peculiar quality of evacuating the ducts of the liver; and he conſiders its operation in this way as often diminiſhing or ſuperſeding the neceſſity of copious blood-letting. He illuſtrates the advantage of thus "emulging the biliary ducts," by referring to the great and ſpeedy relief afforded by drawing out the milk from the *mamma*, where this gland becomes inflamed after lying in, or during the period of lactation; in many caſes of which, indeed,

indeed, "little elſe is neceſſary than emptying the lactiferous ducts at the beginning, and repeating it from time to time as the milk re-accumulates; the inflammatory action of the veſſels often ſubſiding ſpontaneouſly, when this cauſe of diſtenſion and irritation is removed." And he expreſſes his conviction in the ſtrongeſt terms, that, by the early and free adminiſtration of calomel, he has ſaved many a pound of blood; which muſt otherwiſe have been taken away, to alleviate the urgent ſymptoms of hepatic inflammation. Dr. Curry's plan is to give three or four grains of calomel every four or ſix hours, according to the urgency of the ſymptoms. The bowels may be cleared by other purgatives, he ſays, without much relief; and even calomel is often attended with little, if any, more advantage, if it paſs very ſpeedily through the inteſtines. Its *cholagogue* effects in acute hepatitis, he aſcribes to "its leſſening or removing, in the firſt inſtance, that inflammatory conſtriction of the ducts, which occaſions the bile to be retained in the liver; for other medicines, the general cathartic effect of which is much greater than that of calomel, are by no means of equal ſervice;" and when calomel itſelf paſſes ſpeedily, he had been often obliged "to aſſiſt its relaxing power on the biliary ducts," by joining it with opium and antimonial powder, eſpecially the former; giving a grain or more of it every ſix hours, or according to the urgency of the pain. The concluding obſervations are important in a practical view.

"Under this management, I have frequently found the urgent ſymptoms abate conſiderably, many hours before any alvine evacuation took place, and of courſe before the calomel could be ſaid to act as a cathartic: in ſome caſes, too, where no evacuation followed, it became neceſſary to give cathartic medicines afterwards, in order to ſecure the relief which the calomel had procured, and to prevent the pain and dyſpnæa from returning; which they were apt to do, if the liver was not emptied while under the relaxing influence of the calomel and opium. It not unfrequently happens, that the ſtomach partakes ſo much of the inflammatory condition of the liver, and becomes in conſequence ſo extremely irritable, as to reject every thing by vomiting almoſt as ſoon as ſwallowed. In this ſtate of continual retching, which greatly aggravates the diſeaſe, and increaſes the pain almoſt to agony, the effervеſcing draughts, and other means uſually employed, were of no avail, nay, even calomel united with opium proved too irritating. Under theſe circumſtances, inſtead of calomel in its ordinary ſtate, I have with the beſt effects preſcribed calomel freed from its muriatic acid, by carefully triturating it with warm water; whereby it is converted into a dark ſlate-coloured oxyd, virtually the ſame with the hydrargyrus præcipitatus cinereus of the Edin. Pharm. and with that formed in making Plenck's ſolution, which you yourſelf firſt employed and recommended in this country. It is ſo much leſs irritating to the ſtomach and bowels than calomel, that when joined with opiates it will be retained with eaſe; and the effects of it in allaying pain, retching, and other urgent ſymptoms in hepatic inflammation, have been often no leſs aſtoniſhing to myſelf, though long in the habit of uſing it, than to a number of gentlemen who have had an opportunity of inveſtigating a practice which was altogether new to them." (Dr. Curry's Letter to Dr. Saunders, in the Treatiſe on the Liver, p. 335. 3d edit.)

When authorities are thus balanced, it is not eaſy to determine on which ſide the greater accuracy lies. We cannot doubt that ſucceſs has attended both the modes of evacuating the *primæ viæ*, which we have above deſcribed: but it would ſeem more conſiſtent with the general principles of practice eſtabliſhed in the treatment of acute inflammation of the internal organs, to truſt more to the depletion of the blood-veſſels, and to be more cautious in the adminiſtration of opium, than the author of the preceding paſſage recommends. Not to mention, that the alleged "*relaxing* influence" of calomel appears to be a gratuitous ſuppoſition, or at leaſt an hypothetical expreſſion of a fact not yet ſufficiently aſcertained. At all events, it ſeems to be eſtabliſhed by the moſt able practitioners, that theſe three remedies, blood-letting, bliſters, and cathartics, are the principal expedients by which the acute hepatic inflammation can be ſubdued in its early ſtage; and that they are to be actively employed, until a diminution of the pain and an abatement of the febrile ſymptoms ſhall be obtained. At the ſame time, a light and chiefly liquid nutriment muſt be adhered to, and every ſpecies of fermented, vinous, and ſpirituous liquors, excluded from the diet of the patient. By theſe means, if adopted at the commencement of the inflammation, in this country, we may generally ſucceed in checking every tendency to the ſuppurative proceſs. But in warm climates, and eſpecially in the Eaſt Indies, where hepatitis may be regarded as the peculiar endemic of the country, the tendency of the diſeaſe to run on to ſuppuration is ſo great, as ſcarcely to be reſiſted even by the moſt active practice: therefore, if an early and vigorous purſuit of the antiphlogiſtic plan of treatment be neceſſary in this country, where the courſe of the diſeaſe is comparatively moderate, the extenſion of ſuch treatment to the utmoſt limits of prudence becomes expedient, if we would oppoſe with ſucceſs the rapidity of its progreſs. (See Dr. Saunders, loc. cit. p. 318, and a Letter to him from Mr. Chriſtie, Med. and Phyſ. Journal, vol. ii. p. 4.)

We have purpoſely omitted, hitherto, to mention the adminiſtration of mercury in the treatment of hepatitis. A very miſchievous opinion, derived from the practitioners in India, has for ſome time prevailed, that mercury is a ſpecific in every diſeaſe of the liver; and that even in active phlegmonous inflammation of this viſcus it will prevent ſuppuration. This opinion, which has been built on the ſucceſs of mercurials in the chronic inflammations of the liver, has led to an empirical practice, in which no diſcrimination is made between forms of the diſeaſe, which differ more in their nature, than in the name impoſed upon them. And there can ſcarcely be a doubt, from the known effects of mercury on the body, that, if it be incautiouſly employed in the active period of inflammation, it will increaſe the action of the arterial ſyſtem, (already too much quickened,) and therefore tend directly to accelerate, and not to retard, the ſuppurative proceſs. It appears, indeed, that many judicious and ſucceſsful practitioners in India do not adminiſter mercury, until the violence of the inflammatory action has been moderated by bleeding, active purging, and the antiphlogiſtic plan of treatment. We are now ſpeaking of the adminiſtration of mercury in ſuch a way as to produce the peculiar effects of that metal on the conſtitution at large.

As ſoon as an abatement is perceived in the pain and febrile ſymptoms, then the period is arrived at which the uſe of mercury may be reſorted to with great advantage. It appears, on attentive obſervation, that the tranſition of active inflammation to a ſtate of reſolution, is not immediately followed by a healthy condition of the part; but it remains for a time debilitated, and diſpoſed to laps into a chronic ſtate. This may poſſibly be owing to the peculiarity of the *venous* circulation through the liver, and to the

greater

greater difficulty of recovering their tone, after inflammatory diſtenſion, inherent in the extremities of thoſe veins, than in the branches of the arterial ſyſtem. When this period is arrived, the exhibition of mercury is to be begun; and its introduction into the ſyſtem through the abſorbent veſſels of the ſkin, by means of friction, is generally preferred to the internal uſe of it. About half a drachm of the ſtrong mercurial ointment may be rubbed upon the right ſide every night; care being taken to watch minutely whether the pain or fever be at all reproduced by it; in which caſe it ſhould be inſtantly laid aſide, as no advantage can be expected from it under ſuch circumſtances. The right ſide has been generally pointed out as proper for the friction, perhaps from a notion of its efficacy being greater when applied to the vicinity of the diſeaſed organ, than to a diſtant part. But the knowledge derived from anatomy, reſpecting the origin and direction of the abſorbent veſſels, ſufficiently proves, that no part of the mercury can be made to paſs through the liver, in its way into the ſyſtem, either by internal or external exhibition: it can only, therefore, act on the liver, by being firſt introduced into the blood-veſſels. Hence it is of little importance, on what part of the ſkin the mercurial ointment is applied, provided the effects produced on the conſtitution be equally ſtrong; except, indeed, that friction on the hypochondrium may ſerve the office of gentle exerciſe to the part, and thus aſſiſt in emulging the biliary ducts.—When the chronic ſtate of diſeaſe is obſtinate, or if jaundice accompanies it, inſtead of uſing the mercury ſo as to induce a ſlight change upon the pulſe, with only a tenderneſs of the mouth, we ought to extend its effects to the production of a gentle ſalivation, which, when continued for a length of time, generally effects a cure.

From the time that the patient enters upon the courſe of mercury, it is proper to change the internal medicine, and to give a ſlight infuſion of ſome bitter, ſuch as quaſſia or gentian; to each doſe of which as much of a neutral ſalt may be added, as will procure daily one evacuation. By degrees, too, the diet may be improved, by the addition of animal broths, &c. till the patient is perfectly reſtored to health.

When the inflammation has gone on to ſuppuration, the abſceſs diſcharges its contents in various ways, as we have already ſtated. Over the direction to which the abſceſs tends we have no controul; but when its progreſs is towards the external ſurface, its diſcharge may be facilitated by ſurgical means. As ſoon, therefore, as the ſuppuration is obviouſly going on, we ſhould ſupport the ſtrength of the patient by a nouriſhing, though mild diet; and ſhould examine minutely, from time to time, into the ſtate of the ſide, both between the ribs and under them; and as ſoon as any bulging of the ribs, or any tumour below their margin, which gives the ſenſation of fluctuation, is obſerved, the matter may be diſcharged through a ſmall oriſice made by a lancet. Such abſceſſes are ſeldom in haſte to heal, nor is it deſirable, until the cavity of the abſceſs ſhall have been filled up by healthy granulations. During this proceſs, which is ſometimes very tedious, the ſtrength gradually returns: and inſtances have occaſionally occurred, in which the health was perfectly re-eſtabliſhed, after the diſcharge accompanying the proceſs of granulation had continued for years.

HEPATITIS *Lapis*, in *Natural Hiſtory*, a name given by ſome of the ancients to a ferruginous ſtone of a yellowiſh red colour; others called a coarſe jaſper, and ſome a dirty kind of hyacinth, by this name: in ſhort, they ſeem to have called any thing hepatitis that was of a liver-colour. The ſtone moſt generally ſo called, however, ſeems to have been of the nature of ſome of our poor iron ores.

HEPATOCE'LE, in *Surgery*, a term derived from ἡπαρ, *the liver*, and κηλη, *a tumour*, and ſignifying a hernia or rupture containing the liver. One would ſuppoſe, from the magnitude of this viſcus, and the manner in which it is fixed in its natural ſituation, that it could never compoſe any part of the contents of a hernia. The records of ſurgery, however, tend to prove the contrary. "Mr. Gay and Mr. Nourſe found the liver in the ſac of an umbilical hernia; and Bohnius ſays, that he did alſo." (Pott's Chirurgical Works, vol. ii.) We conclude, that a part of the liver was ſeen in the hernia, to which alluſion is made. The examples, in which a partial protruſion of this large viſcus ſeems moſt poſſible, are thoſe which have been denominated by the French "eventrations," where an extenſive portion of the abdominal parietes yields, ſo as to form a kind of pouch, with an exceedingly wide entrance. Such eventrations are apt to take place, when the ſides of the abdomen have been deprived of their tone by blows, the diſtenſion occaſioned by repeated pregnancies, &c.

HEPATOSCOPIA, Ἡπατοσκοπια, formed of ἡπαρ, *liver*, and σκοπεω, *I conſider*, in *Antiquity*, a ſpecies of divination, wherein predictions were made by inſpecting the livers of animals.

HEPATOSCOPIA is alſo uſed as a general name for divination by intrails. See an account of the ſymptoms of the liver, whence good or evil were foretold, in Potter's Archæol. Græc. lib. ii. cap. 14. tom. i. p. 316. See EXTISPEX.

HEPATUS, in *Ichthyology*. See LABRUS and TRUTTHS.

HEPETIS, in *Botany*. See PITCAIRNIA.

HEPHÆSTIA, Ἡφαιστια, in *Antiquity*, an Athenian feſtival in honour of Ἡφαιστος, *i. e.* Vulcan; the chief ceremony of which was a race with torches. For an account of the ceremonies and games, on this occaſion, ſee Potter's Archæol. Græc. lib. ii. cap. 20. tom. i. p. 399.

HEPHESTIA, in *Ancient Geography*, a town in the eaſtern part of the iſland of Lemnos, E.S.E. of Myrina.—Alſo, a town of Aſia, in Lycia.

HEPHÆSTIAS, in the *Writings of the Ancients*, the name of a plaiſter uſed among the ſurgeons to excite a cicatrix. It was principally compoſed of burnt earth, or of the tiles that had been long burnt in the kilns, reduced to powder.

HEPHESTION, in *Biography*, a Greek grammarian of Alexandria, in the reign of the emperor Verus, wrote a work, which is ſtill extant, under the title of "Enchiridion de Metris et Poemate," of which an edition in Greek and Latin was given by Pauw at Utrecht 1726. He is likewiſe quoted by Meibomius, and other muſical writers, on the relation between the metrical part in poetry, and time in muſic. The work alluded to is "De Re Metrica." Suidas. Jul. Capitolinus.

HEPHTHEMIMERIS, compoſed of ἑπτα, *ſeven*, ημιτυς, *half*, and μερος, *part*, in the Greek and Latin *Poetry*, a ſort of verſe conſiſting of three feet and a ſyllable; that is, of ſeven half feet.

Such are moſt of the verſes in Anacreon.

Θελω	λεγειν	Ατρει	δαις
Θελω	δε Καδ	μον α	δαν, &c.

And that of Ariſtophanes, in his Plutus;

Ἑπτα δ' ἡμιν ἡμιποδιον.

They are alſo called *trimetri catalectici*.

HEPHI-

HEPHTHEMIMERIS, or *Hephthemimeres*, is alſo a cæſura after the third foot; that is, on the ſeventh half-foot. It is a rule, that this ſyllable, though it be ſhort in itſelf, muſt be made long, on account of the cæſura, or to make it an hephthemimeris. As in that verſe of Virgil:

"Et furiis agitatus amor, et conſcia virtus."

It may be added, that the cæſura is not to be on the fifth foot, as it is in the verſe which Dr. Harris gives us for an example:

"Ille latus niveum molli fultus Hyacintho."

This is not an hephthemimeris cæſura, but a henneamimeris, *i. e.* of nine half feet.

HEPIALUS, in *Entomology*, a new genus inſtituted by Fabricius, for the reception of thoſe moths or phalænæ, of the bombyx kind, which have the antennæ moniliform; the feelers two, reflected, and hairy, with the rudiment of a bifid tongue between.

Theſe inſects are ſo nearly allied to the bombyx family, that the ſeparation of the ſpecies which compoſe the genus, from the bombyces, is conſidered by ſome entomologiſts as a needleſs innovation; by others it is regarded differently, and we are clearly of the latter opinion. The hepialus is a good natural family. There is an evident diſſimilarity in the general appearance from the true bombyces, and a diſtinction equally material in their manners, the latter of which cannot have eſcaped the obſervation of the practical entomologiſts. They have been long known among Engliſh collectors by the trivial name of ſwifts, or ſwift moths. They are the firſt tribe of moths that appears on the wing in the evening, riſing from their lurking places at twilight, and thus preceding the flight of the true bombyces for ſome ſpace of time; they alſo fly much nearer the ground than the others, like the ſwift among birds; repeatedly darting down and ſkimming the ſurface; then riſing to the height of a few feet, hovering for a while over ſome particular ſpot, and then again darting away, and deſcribing circles in its aerial progreſs in the ſame manner as the ſwift or the ſwallow. Its evolutions on the wing (in ſome ſpecies eſpecially) reſemble the quick motions of the pendulum of a clock; and is always diſtinguiſhed by a far briſker vibratory movement of the wings than any other tribe of moths. The "ſwift moths" diſappear as the darkneſs of the night prevails, at which time the flight of the bombyces has only juſt commenced; in ſhady places the ſwift moths ſometimes riſe and are ſeen on the wing, even before ſunſet.

The larvæ of the hepialus family, ſo far as they have been aſcertained, feed entirely under ground on the roots of plants; they are uſually naked and furniſhed with ſixteen feet. The pupa folliculate, cylindrical, and pointed at the tip. In the winged ſtate the difference in the appearance of the two ſexes of the ſame ſpecies is oftentimes very conſiderable.

Species.

HUMULI. Wings of the male ſnowy and ſtriated; of the female yellow, with fulvous marks. Linn. Donov. Br. Inſ. *Ghoſt moth.*

Theſe moths are often ſeen, during the early part of ſummer, hovering about incloſed grounds near the ſkirts of woods at twilight, and not unfrequently in burying grounds; from which latter circumſtance, in addition to the ſnowy whiteneſs of the male inſect, this ſpecies has long ſince obtained the trivial appellation of the ghoſt moth. Both ſexes nearly correſpond in ſize, being about two inches and a half in breadth when the wings are expanded; and the female rather larger than the male. The difference in colour is ſo very conſiderable, that they might be eaſily miſtaken for diſtinct ſpecies, the whole of the upper ſurface in the male being a pure ſnowy white with a gloſs like ſatin; the female yellow, with orange marks on the upper wings, and brown on the lower. Inhabits Europe.

The larva feeds on the roots of graſs, and is naked, its colour pale, and the head teſtaceous.

JODUTTA. Wing livid, with two darker bands. Fabr. Inhabits Germany.

LUPILINUS. Wings cinereous, with a whiter ſtreak. Linn.

Found in the north of Europe.

HECTUS. Wings deflected, yellow, with two oblique whitiſh bands compoſed of interrupted dots. Linn. Donov. Br. Inſ.—*Golden ſwift.*

Inhabits woods in Europe. The lower wings livid brown. Breadth, when the wings are expanded, about an inch and a quarter.

OBLIQUUS. Wings deflected, brown, with a white line at the baſe, and two oblique bands of interrupted dots. Fabr.

Native of France; and is allied to the laſt. The antennæ are ferruginous; head and thorax hairy, cinereous.

CARNUS. Wings brown; upper pair with ſcattered dots of black and white. Fabr.

Inhabits Auſtria.

CRUX. Wings reddiſh-yellow, with two oblique white lines; antennæ ſerrated. Fabr.

An European ſpecies; the antennæ rufous; head and thorax hairy, grey; lower wings and all beneath darker.

BUFO. Wings deflected, yellowiſh, with a broad brown band. Fabr.

Native of Germany.

MAPPA. Wings brown, with large irregular waved marks of a livid colour, and four diſtinct white triangular ſpots near the apex.—Donov. Brit. Inſ. *Map-winged ſwift moth.*

A very elegant and rare ſpecies found in England; the ſize larger than the golden ſwift.

VENUS. Anterior wings dark, with many oblong pearly ſpots; poſterior pair brown and immaculate; body ferruginoue. Cramer.

Inhabits the interior of Africa.

HEPPACH, in *Geography*, a village of Wurtemberg, famous for its wine; eight miles S.E. of Stuttgart.

HEPPENHEIM, a town of Germany, in the circle of the Lower Rhine; 10 miles E. of Worms.—Alſo, a town of France, in the department of Mont Tonnerre, lately in the palatinate of the Rhine, on the Wees; four miles S.E. of Worms.

HEPSETUS, *Ichthyology*. See ESOX and ATHERINA. The Atherina hepſetus has 12 rays in the anal fin; it is found in the Mediterranean and Red ſeas.

HEPTABOLUS, or EPTABOLUS, in *Geography*, a lake of Mauritania, which received the Dyris, a river that iſſued from Mount Atlas, and that afterwards took the name of Niger, according to Vitruvius (l. viii. c. 2.), who ſuppoſes that this was the ſource of the Nile.

HEPTACA, in *Botany*, (ἑπτὰ-χα, *ſeven-fold*,) in alluſion to the ſeven cells of the fruit, as Father Loureiro, the author of the name, informs us. Loureir. Cochinch. 657.—Claſs and order, *Polygamia Dioecia*, Loureir. It more properly belongs to *Polyandria Monogynia*, or *Icoſandria Monogynia*, it is impoſſible, from his deſcription, to ſay which.

Gen. Ch. *Cal.* Perianth of three ovate, concave, ſpreading leaves. *Cor.* Petals 10, ovate-oblong, ſpreading in a wheel-like form, longer than the calyx. *Stam.* Filaments about

about 100, thread-ſhaped, ſhorter than the corolla; anthers linear, erect. *Piſt.* Germen roundiſh; ſtyle thick, as long as the ſtamens; ſtigma in ſeven deep, channelled, ſpreading ſegments. *Peric.* Berry roundiſh, of ſeven cells, with many ſeeds. *Seeds* roundiſh.

There are flowers deſtitute of a piſtil, found on a ſeparate plant.

Eſſ. Ch. Calyx of three leaves. Petals ten. Berry of ſeven cells, with many ſeeds. Some flowers male.

1. H. *africana*, the only ſpecies, found in woods on the eaſtern coaſt of Africa, near Moſambique, where it is called *Mu cao cao*. A ſmall tree, with ſpreading *branches*. *Leaves* alternate, ſtalked, ovate, entire, veiny, ſmooth. *Flowers* white, on many-flowered, lateral ſtalks. *Berry* green, two inches in diameter.

As no account is given of the ſituation of the germen, or inſertion of the ſtamens, we can neither determine the artificial nor natural claſs of this plant. It is one of the good Father Loureiro's botanical riddles, which we cannot gueſs, and may be a genus entirely unknown to other botaniſts. Poſſibly it may belong to the natural order of *Myrti*, the author having miſtaken a coloured calyx for five of the petals, and bracteas at the baſe of the germen for a calyx of three leaves; at leaſt we can ſuggeſt nothing better.

HEPTACHORD, of ἑπτα, *ſeven*, and χορδη, *chord* in the *Ancient Muſic*. *Heptachord* was applied, according to the etymology of the term, to the lyre, when it had but ſeven ſtrings, and is generally ſaid of any inſtrument that has but that number; one of the intervals is alſo called heptachord, as it contains that number of degrees between its extremes. See SEVENTH.

In the ancient poetry, it ſignified verſes that were ſung or played on ſeven chords, notes, or ſounds, and probably on an inſtrument with ſeven ſtrings. See LYRE.

HEPTACHORD, *Major*, is the major greater, or ſharp ſeventh, an interval whoſe ratio is $\frac{8}{15} = 555\,\Sigma + 11\,f + 48\,m$. See *Major* SEVENTH.

HEPTACHORD, *Minor*, is the minor ſeventh, or greater of the flat ſevenths, an interval whoſe ratio is $\frac{5}{9} = 519\,\Sigma + 10\,f + 45\,m$. See *Minor* SEVENTH.

HEPTACHORD, *Minor*, of Galileo, is the minor ſeventh or leſſer of the flat ſevenths, an interval whoſe ratio is $\frac{9}{16} = 508\,\Sigma + 10\,f + 44\,m$. See *Minor* SEVENTH.

HEPTACOMETÆ, in *Ancient Geography*, a people who inhabited the coaſt of the Euxine ſea, and who, according to Strabo, were denominated "Moſynœci," and extended themſelves to the extremity of Mount Scydiſſes. They exceeded all other barbarians in ferocity, and fixed their habitations in trees and ſmall towers.

According to the Greek etymology Heptacometæ ſignify ſeven villages, and Moſynœci, their other name, derived from *Moſſynes* and *Oicos*, denoted their being inhabitants of towers. Theſe people maſſacred three cohorts of Pompey's army in paſſing through their mountains.

HEPTAGON, of ἑπτα, *ſeptem*, *ſeven*, and γωνια, *angle*, in *Geometry*, a figure conſiſting of ſeven ſides and ſeven angles. If the ſides and angles be all equal it is called a regular heptagon. The area of a regular heptagon is = the ſquare of one of its ſides multiplied by 3.6339126, or = the ſquare of the ſide multiplied by $\frac{7}{4}\,t$, where t denotes the tangent of the angle made by a line drawn from the centre to either extremity of the ſide, radius being 1. For the method of finding it, ſee POLYGON.

HEPTAGON, in *Fortification*, a place ſtrengthened with ſeven baſtions for its defence.

HEPTAGONAL NUMBERS, are a ſort of polygonal numbers, in which the difference of the terms of the correſponding arithmetical progreſſion is five; thus,

Arithmeticals, 1, 6, 11, 16, 21, 26, &c.
Heptagonals, 1, 7, 18, 34, 55, 81, &c.

where the heptagonals are formed by continually adding the terms of the arithmeticals, above them, whoſe common difference is 5.

One property, among others, of theſe numbers, is, that if any one of them be multiplied by 40, and 9 be added to the product, the ſum is always a ſquare number; thus,

$1 \times 40 + 9 = 49 = 7^2$
$7 \times 40 + 9 = 289 = 17^2$
$18 \times 40 + 9 = 729 = 27^2$
$34 \times 40 + 9 = 1369 = 37^2$, &c. &c.

Here it is remarkable that the ſeries of ſquares thus formed is $7^2, 17^2, 27^2, 37^2$, &c. the common difference of whoſe roots is 10, the double of the common difference of the arithmetical ſeries from which the heptagonals are formed. See POLYGONALS.

HEPTAGYNIA, in *Botany*, from ἑπτα, *ſeven*, and γυνη, *a female*, the name of ſuch orders in the principal claſſes of the Linnæan ſyſtem, as are characterized by ſeven ſtyles in each flower, or where the ſtyles are wanting, ſeven ſeſſile ſtigmas. It is an order of very rare occurrence, and is entirely unknown to the Britiſh Flora; indeed we meet with it no where but in the ſeventh claſs, where this order was formed to admit the genus *Septas*, the uncertainty of which is mentioned under the article HEPTANDRIA.

HEPTAMERIDE, from ἑπτα, *ſeven*, and μερις, *a part*, in *Muſic*, is one of the intervals in the ſyſtem of M. Sauveur, (Mem. de l'Acad. des Sc. 1701,) who divides the octave into 40 parts, which he calls *merides*; then each of theſe into ſeven heptamerides; ſo that the whole octave comprehends 301 heptamerides, which he ſtill divides. See DECAMERIDE.

HEPTAMERIS literally ſignifies a *ſeventh part*; being formed of the Greek ἑπτα, *ſeven*, and μερις, *part* or *portion*.

The heptameris, or eptameride, of M. Sauveur, is $\frac{1}{3}\frac{1}{7}$ſt part of the octave, and $\frac{1}{7}$th part of the meris or *meride* (which ſee). It is equal to 2.040574 Σ; its common logarithm is .9989999.0035, its Euler's log. = .00322226, and it is equal to .185374 of a major comma. Dr. Burney, in his "Dictionary of Muſic," mentions this interval as belonging to the ancient muſic; we are not aware, however, of its uſe more than a century ago, when M. Sauveur introduced it in his logarithmic tempered ſyſtem, with all the principles of which the ancients were unacquainted, as far as we know.

HEPTAMERON, a term literally implying *ſeven days*; being compounded of ἑπτα, *ſeven*, and ἡμερα, *day*.

It is chiefly uſed as a title of certain books, containing the tranſactions of ſeven days.

The heptameron of Margaret de Valois, ſiſter to Francis I. of France, and queen of Navarre, is a very ingenious piece, in the manner of Boccace's Decameron.

HEPTANDRIA, in *Botany*, from ἑπτα, *ſeven*, and ανηρ, *a man*, the ſeventh claſs of the ſexual or artificial ſyſtem of Linnæus, conſiſting of plants with ſeven ſeparate or diſtinct ſtamens, in the ſame flower with the piſtil or piſtils. It is a very ſmall claſs, including four orders;—*Monogynia*, in which is found the *Trientalis*, a pretty Lapland genus which Linnæus deſcribes with ſo much pleaſure in the *Flora Lapponica*, as being the firſt plant he found in that region with ſeven ſtamens, ſo that it ſerved to complete the uniformity of his ſyſtem. The horſe chefnut alſo belongs to this order, and modern writers have removed ſeveral genera to it;—*Digynia*, of which *Limeum*, an African plant, is the only example;—*Tetragynia*.

tragynia, including *Saururus*, a genus from Virginia (*Aponogeton* was originally placed here, but is now more correctly referred to the clafs *Dodecandria*) ;—*Heptagynia* is the fourth order, containing *Septas*, a Cape plant, conſidered by Thunberg as belonging to *Craſſula*. It was originally called *Trientalis capenſis* in the Species Plantarum, and is remarkable for the character by which Linnæus defines it, namely, that it has a calyx of ſeven deep ſegments, ſeven petals, ſeven ſtamens, ſeven germens, and conſequently ſeven capſules.

HEPTANGULAR FIGURE, in *Geometry*, a figure with ſeven angles, and of courſe ſeven ſides.

HEPTANOMIS, in *Ancient Geography*, or Middle Egypt, was ſo called from the ſeven nomes, or prefectures, into which it was divided, though Strabo ſays it contained 16; a difference probably occaſioned by the addition of new nomes to thoſe it originally compriſed, ſuch as thoſe of Oaſis.

The Heptanomis comprehended the whole country on each ſide of the Nile, from Thebais to the point of the Delta, where that river divides into thoſe branches by which it enters into the ſea. Some of the ancients make this tract a part of the Thebais; and ſome of the eaſtern geographers alſo give the ſaid extent to Al-Said. This part of Egypt was, in ancient times, full of large and noble cities. See EGYPT.

HEPTAPHARMACUM, a relaxing, ſuppurating, and incarnating medicine, compoſed of ſeven ingredients. This is much talked of among the ancient writers in medicine. The ingredients were, ceruſs, wax, pitch, litharge, colophony, bull's fat, and frankincenſe. It is deſcribed by Aëtius in his Tetrab. ſerm. 3. cap. 27.

HEPTAPLEURUM, in *Botany*, from ἑπτὰ, *ſeven*, and πλευρὰ, *a ſide*, on account of the ſeven-ſided capſule. Gærtn. v. 2. 472. t. 178. f. 3.

Gærtner has given this name to a fruit that came under his inſpection, in the collection preſerved at the garden of Leyden. It was there marked with a Ceylon name, *Bukera*. He calls it in his letter-preſs *H. ſtellatum*, in the plate *H. acutangulum*. His character and deſcription are as follows.

Eſſ. Ch. Flower unknown. Capſule ſomewhat pyramidal, with ſtar-like angles, without valves. (Cells ſix or ſeven.) Seeds ſolitary.

Deſcr. *Peric.* a ſmall coriaceous capſule, pyramidal, ſomewhat ovate, marked with an obſolete ring, perhaps where the flower was inſerted, a little below the top, above which ring it is extended into a furrowed reddiſh point; its ſhape is angular or ſtar-like; it conſiſts of ſix or ſeven cells, without valves, and ſtands on a little ſlender, oblique ſtalk, like that of umbelliferous plants.—*Recept.* none, the ſeeds being affixed to the tops of the cells.—*Seeds* ſolitary, ovate, narrower upwards, compreſſed, pale, reddiſh. *Integument* quite ſimple, very thin and membranous.—*Albumen* ſhaped like the ſeed, fleſhy, pale.—*Embryo* in the uppermoſt part of the albumen, very minute, poſſibly monocotyledonous?

Among 25 ſpecimens, three only had but ſix cells, the reſt having ſeven. The recent fruit ſeems to be covered with a ſoft or fleſhy coat, as the outſide of the dried capſule is very rugoſe. Gærtner.

HEPTARCHY, compounded of the Greek ἑπτὰ, *ſeven*, and ἀρχὴ, *imperium, government*, a government compoſed of ſeven perſons; or a country governed by ſeven perſons, or divided into ſeven kingdoms.

The Saxon heptarchy included all England, which was cantoned out into ſeven petty independent kingdoms, peopled and governed by different clans and colonies; *viz.* thoſe of Kent, the South Saxons, Weſt Saxons, Eaſt Saxons, Northumberland, the Eaſt Angles, and Mercia. The heptarchy was formed by degrees from the year 455, when firſt the kingdom of Kent was erected, and Hengiſt aſſumed the title of king of Kent immediately after the battle of Eglesford; and it terminated in 827 or 828, when king Egbert reunited them into one, formed the heptarchy into a monarchy, and aſſumed the title of king of England.

We ſhall here ſubjoin a brief account of the ſeveral kingdoms of the heptarchy, of the manner of their formation, of the term of their duration, of the cauſes of their diſſolution, and of the monarchy which was ſubſequently eſtabliſhed in conſequence of their union.

It was about the year 449 or 450 that the two brothers, Hengiſt and Horſa, ſaid to be the great grandſons of Woden, and poſſeſſing great reputation among the Saxons, on account both of their valour and nobility, brought over with them 1600 men, who landed in the iſle of Thanet, and immediately marched to the defence of the Britons, who had implored their ſuccour againſt their northern invaders, the Scots and Picts. Having eaſily conquered theſe invaders, they were induced to direct their arms againſt the Britons themſelves. Accordingly they were ſoon reinforced with a ſupply of 5000 men. Thus recruited, and previouſly apprized of the vices and puſillanimity of Vortigern, the Britiſh leader, they fought a quarrel with the Britons, by complaining that their ſubſidies were ill paid and their proviſions withdrawn; and immediately throwing off the maſk, they formed an alliance with the Picts and Scots, and proceeded to open hoſtility againſt the Britons. In the battle of Eglesford, now Ailsford, Horſa was ſlain, and the ſole command of his countrymen devolved on Hengiſt. This active general, deriving continual reinforcements from Germany, extended the terror of his arms, and with this view ſpared neither age, nor ſex, nor condition, wherever he marched with his victorious forces. The private and public edifices of the Britons were reduced to aſhes; the prieſts were ſlaughtered on the altars by theſe idolatrous ravagers; the biſhops and nobility ſhared the fate of the vulgar; the people, flying to the mountains and deſerts, were intercepted and butchered in heaps: ſome were glad to accept of life and ſervitude under their victors: others, deſerting their native country, took ſhelter in the province of Armorica, where, being charitably received by a people of the ſame language and manners, they ſettled in great numbers, and gave the country the name of "Brittany."

Among other cauſes which facilitated the entrance of the Saxons into this iſland, one has been aſſigned by Britiſh writers, which was the paſſion indulged by Vortigern for Rowena, the beautiful daughter of Hengiſt, of which this artful warrior availed himſelf in order to blind the eyes of the imprudent monarch. It is added by the ſame hiſtorians, that when Vortigern was reſtored to the throne, on the death of Vortimer, he accepted a banquet from Hengiſt, at Stonehenge, where 300 of his nobility were treacherouſly ſlaughtered, and himſelf detained captive. But theſe ſtories are probably apologies invented by the Welſh authors for the feeble reſiſtance of their countrymen, and for the rapid progreſs and licentious devaſtations of the Saxons. When Ambroſius, after the death of Vortimer, was inveſted with the command over his countrymen, he endeavoured to unite them in their reſiſtance againſt the Saxons. But though his efforts were not altogether unſucceſsful, Hengiſt maintained his ground in Britain, and in order to divide both the attention and the forces of the natives, he called over a new tribe of Saxons, under the command of his brother Octa, and of Ebiſſa, the ſon of Octa, and ſettled them in Northumberland. He himſelf remained in the ſouthern parts of the iſland, and laid the foundation of the kingdom of *Kent*, comprehending the county of that name, Middleſex, Eſſex, and

and part of Surrey. This kingdom was advantageouſly ſituated, having the ſea on the S. and E.; the Thames on the N.; and the little kingdom of Suſſex on the W. As long as it ſubſiſted, it ſerved as a bulwark to the kings of Kent againſt the ambitious encroachments of the kings of Weſſex. But after it was ſubdued by the Weſt Saxons, the kingdom of Kent was in continual danger of falling under the dominion of theſe powerful neighbours. This kingdom was not above 60 miles in length and 30 in breadth. Hengiſt fixed his royal ſeat at Canterbury, where he died in 488, leaving his newly acquired dominion to his poſterity, who retained it till the diſſolution of the heptarchy.

The ſucceſs of Hengiſt induced other northern Germans to invade this iſland. Theſe conquerors were chiefly compoſed of three tribes under the denominations of Saxons, Angles, and Jutes, who, ſpeaking the ſame language and being governed by the ſame inſtitutions, and actuated alſo by a common intereſt, were naturally led to unite againſt the ancient inhabitants. The reſiſtance of the Britons was gradually enfeebled: and after a ſucceſſion of diſaſters, they were driven into Cornwall and Wales, where they were indebted for their protection to the remote ſituation or inacceſſible mountains of thoſe countries.

Of all the ſovereigns of this kingdom, Ethelbert is the moſt worthy of notice, partly becauſe he gained an aſcendant among the Saxon ſtates, by reducing all the princes, except the king of Northumberland, to a ſtate of dependence, and eſtabliſhing himſelf by force on the throne of Mercia, which indeed he afterwards reſigned; and partly becauſe the Chriſtian religion was introduced among the Engliſh Saxons during his reign. (See ETHELBERT and AUGUSTIN.) The royal family of Kent was extinguiſhed after the death of Alric in 794, and the ſtate was thrown into confuſion, by every factious leader who aſpired to the throne. Baldred, an illegitimate branch of the royal family, was the laſt ſovereign; and after a troubleſome and precarious reign, he was expelled in 823, by Egbert, king of Weſſex, who diſſolved the Saxon heptarchy.

The next Saxon ſtate, after that of Kent, which was eſtabliſhed in Britain, was the kingdom of *South-Saxony* or *Suſſex*, which contained the county of Suſſex and a great part of Surrey, and was not above 50 miles long and 40 broad. It was bounded on the N. by the Thames, on the S. by the ſea, on the E. by the kingdom of Kent, and on the W. by Weſſex. The capital city was Chicheſter. This kingdom was founded by Ælla, a Saxon chief, who, in 477, brought over an army from Germany, and landing on the ſouthern coaſt, proceeded to take poſſeſſion of the neighbouring territory. The Britons were defeated in many battles by their warlike invader; and at length, having laid ſiege to Andred-Ceaſter, which was defended by the inhabitants and garriſon with deſperate valour, he took it, and, irritated by the oppoſition with which he had to contend, put all his enemies to the ſword without diſtinction. This deciſive advantage ſecured the conqueſts of Ælla, who in 491 aſſumed the title of king; but his progreſs was reſtrained on the E. by the kingdom of Kent, and on the W. by another tribe of Saxons, who had taken poſſeſſion of that territory. Ælla, being a prince of great reputation among the Saxons, had been thought worthy to ſucceed Hengiſt in the command of their armies. Upon his death in 514, he left the crown to his only ſurviving ſon, Ciſſa. Upon the death of Ciſſa, in 590, without iſſue, Ceaulin, king of Weſſex, and monarch of the Anglo-Saxons, ſeized the kingdom of Suſſex; and from this time the South-Saxons made ſeveral attempts to ſhake off the yoke of the kings of Weſſex, till at length the kingdom was entirely ſubdued. Their laſt revolt took place in the year 754, in the reign of Sigebert, king of Weſſex; and it is probable that his ſucceſſor Cenulph reduced them again to a ſtate of ſubjection. From that time the South Saxons do not appear to have made any attempt for recovering their liberty; their country being conſidered ever after as a province of Weſſex. The ſubjugation of this kingdom was the firſt ſtep taken by the Weſt Saxons towards acquiring the ſole monarchy of England.

The kingdom of *Weſſex*, or of the *Weſt Saxons*, was ſituated S. of the Thames, being in breadth about 70 miles from the Thames to the Britiſh channel, and in length 150 miles from the frontiers of Suſſex, to the river Tamar, which parted it from Cornwall. It comprehended the counties of Hants, Dorſet, Wilts, Berks, and the Iſle of Wight. Its principal cities were Wincheſter, the capital, Southampton, Portſmouth, Saliſbury, Dorcheſter, Sherborn, Exeter, where many Britons were intermixed with the Saxons. It derived its name from its ſituation, becauſe it lay W. of Suſſex, Kent, and Eſſex. It was guarded on the N. by the Thames, and on the S. by the ſea; on the E. it was bounded by the little kingdom of Suſſex; and on the W. by the Britons of Cornwall, divided from their countrymen the Welſh by the mouth of the Severn, in ſuch a manner, that it was almoſt impoſſible for them to aſſiſt one another. The Weſt Saxons, who were the founders of this kingdom, were Saxons, who landed in the year 495, under the command of Cerdic, and of his ſon Kenric. Cerdic, upon his landing, met with ſuch reſiſtance, that he found it neceſſary to ſeek the ſuccour of his countrymen in the kingdoms of Kent and Suſſex, as well as Germany. Thus ſtrengthened, he gained ſeveral advantages over the Britons; but he was arreſted by them in his progreſs, in conſequence of the aſſiſtance which was afforded them by Arthur, king of the Silures, whoſe heroic valour now ſuſtained the declining fate of his country, and who has been much celebrated in the ſongs of Thalieſſin, and the other Britiſh bards. (See ARTHUR.) The ſiege of Badon, near Bath, was raiſed by the Britons in the year 520, and the Saxons were there defeated in a ſevere battle. This misfortune ſtopped the progreſs of Cerdic; but it was not ſufficient to wreſt from him the conqueſts which he had already made. Cerdic was crowned for the firſt time king of the Weſt Saxons in 519, after having had ſurrendered to him the two counties of Hampſhire and Somerſetſhire, and a ſecond time at Wincheſter in 532 or 533, upon the delivery of Berkſhire, Wiltſhire, Devonſhire, and Dorſetſhire. Cerdic died in 534, and left his crown to his ſon Kenric, who died in 560.

Kynegils, who ſucceeded to the throne in 611, embraced Chriſtianity, through the perſuaſion of Oſwald, king of Northumberland, who had married his daughter, and who had attained a great aſcendant in the heptarchy. Ceodwalla, who commenced his reign in 686, entirely ſubdued the kingdom of Suſſex, and annexed it to his own dominions. He alſo made inroads into Kent, but could not ultimately prevail. Tired at laſt with wars and bloodſhed, he was ſeized with a fit of devotion; beſtowed ſeveral endowments on the church; and made a pilgrimage to Rome, where he was baptiſed by pope Sergius II., and died in 689.

Ina, his ſucceſſor, inherited the military virtues of Cœdwalla, and added to them the more valuable ones of juſtice, policy, and prudence. He made war upon the Britons in Somerſet; and having finally ſubdued that province, he treated the vanquiſhed with a degree of humanity hitherto unpractiſed by the Saxon conquerors. He allowed the proprietors to retain poſſeſſion of their lands, encouraged marriages and alliances between them and his ancient ſubjects,

and gave them the privilege of being governed by the ſame laws, which he augmented and aſcertained. Although he was diſturbed by ſome inſurrections at home, his long reign of 37 years may be regarded as one of the moſt glorious and moſt proſperous of the heptarchy. In the decline of his age he made a pilgrimage to Rome, and after his return ſhut himſelf up in a cloiſter, where he died.

Brithric, the laſt king of Weſſex, was poiſoned in 799, by Eadburga his wife, natural daughter of Offa, king of Mercia, a profligate woman, equally infamous for cruelty and for incontinence; upon which the Weſt Saxons offered the crown to Egbert.

While the Saxons made this progreſs in the South, their countrymen were no leſs active in other quarters. In the year 527, a great tribe of adventurers, under ſeveral leaders, landed on the eaſt coaſt of Britain; and, after fighting many battles, eſtabliſhed three new kingdoms in this iſland, *viz.* Eſſex, Eaſt-Anglia, and Mercia. The kingdom of *Eſſex*, or of the *Eaſt Saxons*, was bounded on the N. by Eaſt Anglia, on the E. by the German ocean, on the S. by the Thames, and on the W. by Mercia. Its greateſt length was 75 miles, and its breadth 38; it contained the counties of Eſſex and Middleſex, diſmembered from that of Kent, and part of Hertfordſhire; its principal cities were London and Colcheſter. This country, which had been erected into a colony in the time of the Romans, but which was much reduced after the arrival of the Saxons, had been extorted from Vortigern by Hengiſt, after the maſſacre of the Britiſh lords, and was formed into a kingdom by Erchenwin, the firſt king who began his reign about the year 585, though the preciſe period has not been aſcertained.

Erchenwin, or Erkinwin, was ſucceeded by his ſon Sleda; and he made way for his ſon Sebert, who, being nephew to Ethelbert, king of Kent, was perſuaded by that prince to embrace the Chriſtian faith. His ſons and joint ſucceſſors, Sexted or Saxned, and Seward, relapſed into idolatry. Sigebert the good, who reigned in 653, reſtored Chriſtianity. Offa, who aſcended the throne in 705, having made a vow of chaſtity, notwithſtanding his marriage with Keneſwitha, daughter of Penda, king of Mercia, went in pilgrimage to Rome, and ſhut himſelf up during the reſt of his life in a cloiſter. Selred, his ſucceſſor, reigned 38 years, and was the laſt of the royal line, which failure produced confuſion, and reduced the kingdom into dependence under Mercia.

The laſt king was Sigered, who commenced his reign in 746, and if he was alive at the diſſolution of the heptarchy, he muſt have reigned 78 years

The kingdom of *Eaſt Anglia*, or of the *Eaſt Angles*, was bounded on the N. by the Humber and the German ocean; on the E. by the ſame ocean; on the S. by the kingdom of Eſſex; and on the W. by Mercia. Its greateſt length was 80, and its greateſt breadth was 55 miles. It contained the two counties of Suffolk and Norfolk, and part of Cambridgeſhire. The chief towns were Norwich, Thetford, Ely, and Cambridge. Uffa aſſumed the title of king in 575, and died in 578.

Earpwold, the fourth king, and great grandſon of Uffa, the founder of the monarchy, was converted to Chriſtianity by the influence of Edwin, king of Northumberland; but his wife, who was an idolatreſs, brought him back to her religion. After his aſſaſſination, and an interregnum of about three years, the throne was occupied by Sigebert, his half-brother, who had been educated in France, reſtored Chriſtianity, and introduced learning among the Eaſt Angles. Some pretend that he founded the univerſity of Cambridge, or rather ſome ſchools in that place.

Ethelbert, the laſt king, was put to death by Offa, king of Mercia, in order to ſeize his kingdom in 792; and from this time Eaſt Anglia and Mercia formed one kingdom.

The kingdom of *Mercia* was bounded on the N. by the Humber, which ſeparated it from Northumberland; on the W. by the Severn, beyond which were the Britons, or Welſh; on the S. by the Thames, by which it was parted from the kingdoms of Kent, Suſſex, and Weſſex; and on the E. by the kingdoms of Eſſex and Eaſt-Anglia. Guarded on three ſides by large rivers, that ran into the ſea and ſerved as a boundary to all the other kingdoms, it was called Mercia, from the Saxon word *merc*, ſignifying a boundary. The principal cities of Mercia were Lincoln, Nottingham, Warwick, Leiceſter, Coventry, Litchfield, Northampton, Worceſter, Glouceſter, Derby, Cheſter, Shrewſbury, Stafford, Oxford, and Briſtol. Of all the kingdoms of the heptarchy, this was the fineſt and the moſt conſiderable. Its greateſt length was 160 miles, and its greateſt breadth about 100. Crida, its founder, arrived in England in 584, and, in that, or the following year, was crowned king, and died in 594.

Penda, who at the age of 50 years aſcended the throne, acted the part of a ſanguinary tyrant; but being defeated and ſlain in a deciſive battle by Oſwy, brother to Oſwald, king of Northumberland, Penda, his ſon, took poſſeſſion of the throne of Mercia, and lived under the protection of Oſwy, whoſe daughter he had married. This princeſs was educated in the Chriſtian faith, and ſhe employed her influence with ſucceſs, in converting her huſband and his ſubjects to the ſame religion. "Thus the fair ſex," ſays Hume, "have had the merit of introducing the Chriſtian doctrine into all the moſt conſiderable kingdoms of the Saxon heptarchy." Of Offa, who mounted the throne of Mercia in 755, we ſhall give an account under his article. The laſt kings of Mercia were Bernulph, or Bernulf, in 821; Ludican, in 823; and Witgalph, or Wiglaff, in 825.

The kingdom of *Northumberland* was ſituated, as its name imports, on the north of the Humber. It was bounded on the ſouth, and parted from Mercia by that river, on the weſt by the Iriſh ſea, on the north by the country of the Picts and Scots, and on the eaſt by the German ocean. It contained the preſent counties of Lancaſhire, Cumberland, Weſtmoreland, Northumberland, York, and Durham. The principal cities were York, Dunelm, ſince called Durham, Carliſle, named by the Romans Luguballia, Hexham, or Hagulſtadt, Lancaſter, and ſome others of leſs note. This country was divided into two parts, Deïra and Bernicia, each of which was for ſome time a diſtinct kingdom of itſelf. Bernicia was partly ſituated on the north of Severus's wall, and ended in a point at the mouth of the Tweed. Deïra contained the ſouthern part of Northumberland, as far as the Humber. The greateſt length of the whole kingdom, including both parts, was 160 miles, and its greateſt breadth 100. The firſt king of Northumberland was Ida, a Saxon prince of great valour, who claimed a deſcent from Woden, brought over a reinforcement from Germany, and enabled the Northumbrians to carry on their conqueſts over the Britons. He entirely ſubdued the county now called Northumberland, the biſhopric of Durham, as well as ſome of the ſouth-eaſt counties of Scotland, and he aſſumed the title of king of Bernicia in 547. About the ſame time Ælla, another Saxon prince, having conquered Lancaſhire, and the greater part of Yorkſhire, received the appellation of king of Deïra. Theſe two kingdoms were united in the perſon of Adelfrid, grandſon of Ida, who married Acca, the daughter of Ælla; and expelling her brother, Edwin, eſtabliſhed one of the moſt powerful of the Saxon kingdoms

doms by the title of Northumberland. He ſpread the terror of the Saxon arms to the Scots and Picts, as well as Welſh, and extended on all ſides the bounds of his dominions. During his ſiege of Cheſter, the Britons marched out with all their forces to engage him; and at a diſtance ſtood 1250 monks from the monaſtery of Bangor, who attended in order to encourage the combatants by their preſence and exhortations. Adelfrid, inquiring into the cauſe of this unuſual appearance, was informed, that theſe prieſts had come to pray againſt him: "Then," ſays he, "they are as much our enemies as thoſe who intend to fight againſt us." And he immediately ſent a detachment, who fell upon them, and ſuffered only 50 to eſcape with their lives. The Britons were totally defeated; Cheſter ſurrendered; and Adelfrid, purſuing his victory, made himſelf maſter of Bangor, and entirely demoliſhed the monaſtery:—a building ſo extenſive, that there was a mile's diſtance from one gate of it to another; and it contained 2100 monks, who are ſaid to have been maintained there by their own labour. See BANGOR.

Young Edwin, who had been unjuſtly diſpoſſeſſed of the crown of Deïra, and who wandered from place to place in order to eſcape the hoſtile deſigns of Adelfrid, found protection at laſt in the court of Redwald, king of the Eaſt-Angles, where his engaging and gallant deportment procured him general eſteem and affection. Redwald nobly refuſed to deliver him up to the emiſſaries of Adelfrid; and in order the more effectually to preſerve him, he attacked Adelfrid while he was unprepared for defence. This monarch was defeated and ſlain; and Edwin obtained poſſeſſion of the crown of Northumberland. Edwin was the greateſt prince of the heptarchy in that age, and diſtinguiſhed himſelf, both by his influence over the other kingdoms, and by the ſtrict execution of juſtice in his own dominions. He reclaimed his ſubjects from the licentiouſneſs to which they had been accuſtomed; and it became a common ſaying, that during his reign a woman or child might openly carry every where a purſe of gold, without any danger of violence or robbery. The Eaſt-Angles conſpired againſt their ſovereign, Redwald, and had put him to death. They offered the crown to Edwin, who not only declined accepting it, from a ſenſe of gratitude to his benefactor, but obliged them to ſubmit to Earpwold, the ſon of Redwald. Edwin, after his acceſſion to the throne, married Ethelburga, the daughter of Ethelbert, king of Kent; who, emulating the glory of her mother Bertha, who had been inſtrumental in converting her huſband and his people to Chriſtianity, carried Paullinus, a learned biſhop, along with her; and beſides ſtipulating a toleration for the exerciſe of her own religion, which was readily granted her, ſhe uſed every reaſon to perſuade the king to embrace it. Edwin, after mature deliberation, and frequent conferences with Paullinus, declared in favour of the Chriſtian religion; and the people ſoon after imitated his example. The death of this excellent prince, in a battle which he fought againſt Penda, king of Mercia, and Cœdwalla, king of the Britons, in the 48th year of his age, and 17th of his reign, divided the monarchy of Northumberland, which that prince had united in his own perſon. Eanfrid, the ſon of Adelfrid, returned with his brothers, Oſwald and Oſwy, from Scotland, and took poſſeſſion of his paternal kingdom, Bernicia; and Oſric, Edwin's couſin-german, eſtabliſhed himſelf in Deïra. Both theſe kings returned to Paganiſm, and the whole people ſeem to have turned with them: ſince Paullinus, who was the firſt archbiſhop of York, and who had converted them, thought proper to retire with Ethelburga, the queen dowager, into Kent. Both theſe princes died prematurely ſoon after; when Oſwald, the brother of Eanfrid, of the race of Bernicia, united again the kingdom of Northumberland in 634, and reſtored the Chriſtian religion in his dominions. Oſwald is much celebrated for his ſanctity and charity, and even for the miracles wrought by his relics, by the monkiſh hiſtorians. The laſt king of Northumberland was Ethelbert, ſon of Mollo, who, though not of the royal family, had ſeized the crown; and after the death of Ethelbert, which was no leſs tragical than that of almoſt all his predeceſſors, an univerſal anarchy prevailed in this kingdom; and the people having, by ſo many fatal revolutions, loſt all attachment to their government and princes, were well prepared for ſubjection to a foreign yoke, which Egbert, king of Weſſex, finally impoſed upon them.

The government of the heptarchy, reckoning from the founding of the kingdom of Mercia, the laſt of the ſeven Anglo-Saxon kingdoms, laſted two hundred and forty-three years; but if the time ſpent by the Saxons in their conqueſt from the arrival of Hengiſt in 449 be added, the heptarchy will be found to have laſted three hundred and ſeventy-eight years, from its commencement to its diſſolution. The cauſes of the diſſolution of the heptarchy were the great inequality among the ſeven kingdoms, three of which greatly ſurpaſſed the others in extent and power; the default of male heirs in the royal families of all the kingdoms, that of Weſſex excepted; and the concurrence of various circumſtances which combined in the time of Egbert.

Egbert, the laſt king of the Weſt Saxons, had in his youth excited the jealouſy of his predeceſſor, Brithric, partly becauſe he had a better title to the crown, and partly becauſe he had acquired, to an eminent degree, the affections of the people. Apprehenſive of danger from the ſuſpicious and jealous temper of Brithric, the young prince withdrew into France, where he was well received by Charlemagne. By living in the court, and ſerving in the armies of that prince, he acquired thoſe accompliſhments which qualified him for occupying the throne to which he was deſtined with dignity and advantage. Having familiarized himſelf to the manners of the French, who were then eminent for valour and civility above all the weſtern nations, he learned to poliſh the rudeneſs and barbarity of the Saxon character. In the laſt year of the eighth century, he was called, as we have already ſtated, to aſcend the throne of his anceſtors. The circumſtances of the times afforded him an opportunity of accompliſhing by his arms and by his prudent policy the object, which had been attempted in vain by ſo many princes. In conſequence of a prevailing opinion of the merit of chaſtity, and of the admiration of a monaſtic life, the royal families had been entirely extinguiſhed in all the Saxon kingdoms, except that of Weſſex; and the emulations, ſuſpicions, and conſpiracies, which had formerly been confined to the princes of the blood alone, were now diffuſed among all the nobility in the ſeveral Saxon ſtates. Egbert was the ſole deſcendant of thoſe firſt conquerors who ſubdued Britain, and who enhanced their authority by claiming a pedigree from Woden, the ſupreme divinity of their anceſtors. Egbert, however, declined for ſome time giving any diſturbance to his Saxon neighbours, and choſe rather to turn his arms againſt the Britons in Cornwall, whom he defeated in ſeveral battles. At length he was recalled from theſe conqueſts by an invaſion made upon his own dominions, by Bernulf, king of Mercia. The Mercians, indeed, before his acceſſion, had very nearly attained the abſolute ſovereignty in the heptarchy; they had reduced the Eaſt-Angles to ſubjection, and eſtabliſhed tributary princes in the kingdoms of Kent and Eſſex. Northumberland was involved in anarchy; and no ſtate of any conſequence remained but that

of

of Weſſex, which, much inferior in extent to Mercia, was ſupported ſolely by the great qualities of its ſovereign. Egbert led his army againſt the invaders; and in a ſingle battle, fought at Ellandum in Wiltſhire, gave a mortal blow to the power of the Mercians. He then entered their country on the ſide of Oxfordſhire, and threatened the heart of their dominions: he ſent an army into Kent, under the command of Ethelwolph, his eldeſt ſon, and made himſelf maſter of that country, by the expulſion of Baldred, the tributary king. The kingdom of Eſſex was conquered with equal facility; and the Eaſt-Angles, from their hatred to the Mercian government, eſtabliſhed and maintained by treachery and oppreſſion, were glad to riſe in arms, and to crave the protection of Egbert. Bernulf, the Mercian king, who marched againſt them, was defeated and ſlain; and Ludican, his ſucceſſor, ſhared the ſame fate. Theſe inſurrections and calamities facilitated the enterpriſes of Egbert, who, advancing to the centre of the Mercian territories, eaſily ſubdued a diſpirited and divided people. That they might the more readily ſubmit, he allowed Wiglaf, their countryman, to retain the title of king, whilſt he exerciſed the real powers of ſovereignty. The anarchy of Northumberland afforded him the opportunity of an eaſy conqueſt; but he allowed to Northumberland, as he had done to Mercia and Eaſt-Anglia, the power of electing a king, who was to be his dependent, and to pay him tribute. The territories of Egbert, after the incorporation and union of theſe ſeveral ſtates, were nearly of the ſame extent with what is now properly called England; and a favourable proſpect was afforded to the Anglo-Saxons of eſtabliſhing a civilized monarchy, poſſeſſing tranquillity within itſelf, and ſecure againſt any foreign invaſion. This great event happened in the year 827. Rapin's Hiſt. vol. i. Hume's Hiſt. vol. i.

HEPTASTADIUM, *q. d.* ſeven ſtadia, in *Ancient Geography*, a country, or mole, which joined the iſle of Pharos at Alexandria to the continent. See ALEXANDRIA and PHAROS.

HEPTATEUCH, in *Matters of Literature*, a volume, or work, conſiſting of ſeven books.

The word is compounded of ἑπτα, *ſeven*, and τευχω, *I do, I work*; whence τευχος, *a work, book*; and ἑπτατευχος, *heptateuch*, a work of ſeven parts, or ſeven different works joined in one volume.

Heptateuch is chiefly applied to the firſt ſeven books of the Old Teſtament; *viz.* Geneſis, Exodus, Leviticus, Numbers, Deuteronomy, Joſhua, and Judges; that is, the five books of Moſes, called the *Pentateuch*, and the two following ones, which are uſually joined with the others.

HER, EL, in *Geography*, a town of the deſert of Syria; 18 miles E. of Taibeh.

HERA, mountains of Arabia, to which Mahomet often retired before he appeared in the world as a prophet; three miles from Mecca.

HERACLEA, in *Ancient Geography*, a name given to more than 40 towns in Europe, Aſia, Africa, and the iſlands of the Mediterranean. They are ſuppoſed to have derived this appellation from Heracles, correſponding to Hercules, and to have been either built in honour of Hercules, or placed under the protection of this deity: *e. g. Heraclea* is an ancient name of Calpé in Spain. (See CALPÉ.)—Alſo, a town of the Gauls, at one of the mouths of the Rhone, according to Pliny.—Alſo, a town of Italy, upon the Aciris, near its mouth, in the gulf of Tarentum, now *Policoro*.—Alſo, an ancient town of Sicily, called alſo Macara, and ſituated in the territory of the Agrigentines, near the mouth of the river Halycus, and towards the place now called *Campo Bianco*.—Alſo, a town of the iſland of Sardinia, named *Ad Herculem* in the Itinerary of Antonine.—Alſo, a town of Tyrrhenia.—Alſo, a town of Triphylia, almoſt N. of Olympia.—Alſo, a town of Greece, in the Sintic territory, a country of Macedonia, called by Pliny *Heraclea Sintica*.—Alſo, a town of Macedonia, on the coaſt, N. of the iſthmus of mount Athos.—Alſo, a town of Greece, in the Phthiotide, a country of Theſſaly.—Alſo, a town of Acarnania, according to Pliny, who ſays that it was ſituated on the ſea coaſt, on the confines of Etolia.—Alſo, a town of Aſia, in the country of the Maryandænæ, and a colony of Megara, according to Xenophon and Diodorus Siculus. The river Lycos tranverſed the plain before this town.—Alſo, an iſland of the Adriatic ſea. Steph. Byz.—Alſo, a town of the Peloponneſus, in the Elide, near Salmona. According to Strabo it was ſituated on the river Cytherius, about 40 ſtadia from Olympia.—Alſo, a town of the Thracian Cherſoneſus, ſituated at the mouth of the Erginus, and at the iſthmus of the Cherſoneſus.—Alſo, a town of Thrace, placed by Pliny at the foot of mount Pangæa.—Alſo, a town of Thrace, near Calatis, towards the mouth of the Danube, which did not ſubſiſt in the time of Pliny.—Alſo, a maritime town ſituated on the northern coaſt of the iſle of Crete, N. of Gnoſſus, of which, according to Strabo, it was the ſea-port. Pliny ſays that it was oppoſite to the iſland of Dia; and it is ſuppoſed to have ſtood on the ſame ſpot where the town of Candia, which gave name to the whole iſland, was built in after ages. (See CANDIA.)—Alſo, an iſland of the Carpathian ſea. Steph. Byz.—Alſo, a town of Aſia Minor, in Ionia; it was previouſly called *Latmos*, ſituated at the bottom of the Latmic gulf, upon the bank of the river Latmus, and E.S.E. and very near the ſmall iſle of Latmus. Latmus remained under the dominion of queen Artemiſia till her death, but afterwards recovered its liberty. In the time of Strabo it was called *Heraclea ad Latmum*, and was conſiderable. In its ruins may be diſcovered veſtiges of a temple, and of a theatre, dug in a mountain. Near this town was a cavern in which the ſhepherd Endymion is ſaid to have ſlept 30 years by order of Jupiter, and where his tomb was long held in veneration.—Alſo, a town of Aſia, in Syria, ſituated on a peninſula formed on the coaſt.—Alſo, a river of Aſia Minor, in Caria.—Alſo, a village of Aſia Minor, before the gulf of Adramyttium, over-againſt the iſland of Mitylene.—Alſo, a town of Aſia, in Parthia, ſituated near Ragæ.—Alſo, a town of the Tauric Cherſoneſus, according to Pliny, who ſays that the Romans made it a free city, and called it *Megarice*.—Alſo, a town of Aſia, in Sogdiana, beyond the Caſpian ſea, in the country of the Caduſians, according to Pliny, who ſays that it was built by Alexander, and, after having been deſtroyed, rebuilt by Antiochus, who gave it the name of *Achaide*.—Alſo, a town of Egypt, between Peluſium and Tmuis, according to Joſephus.—Alſo, a town of Africa, in Libya. Steph. Byz.

HERACLEA *Pontica*, a town of Aſia Minor, ſituated on a ſmall gulf formed by the Euxine ſea. This city maintained its independence as a republic, governed by its own magiſtrates, between the two powerful ſovereigns, Mithridates and Nicomedes, and ſerved as a common barrier. Xenophon and Pauſanias ſay that it was founded by a colony from Megara, to which were joined Bœotians, natives of Tanagra. It was afterwards expoſed to the invaſions of the Gauls; but recovered its liberty by the exertions of Nymphis the hiſtorian, a native of the place, who deviſed means for delivering his country. Heraclea furniſhed ſuccours to Ptolemy againſt Antigonus, and though it afforded aſſiſtance by its marine to Rome, and notwithſtanding a treaty of alliance, offenſive and defenſive, between Rome and Heraclea, it was pillaged by Cotta, under a pretext of its reſiſting the exactions impoſed

impoſed upon it by the publicans of Rome. It was famous for its ſplendid library, its temple, and public places, adorned with a number of fine ſtatues, which were plundered by Cotta, who alſo took away a magnificent ſtatue of Hercules.

HERACLEON, in *Botany*, a name given by ſome of the Greek writers to the lithoſpermum, or gromwell. It was originally called the *heracleon ſporon*, ηρακλεον σπορον, the *hercules-ſeed*, from the remarkable hardneſs of the ſeed; but the latter word was dropped, and the heracleon only preſerved. There is great reaſon againſt uſing the word dioſpyros as a ſynonym for the gromwell, becauſe it is a name given by ſome of the Greeks to a very different kind of vegetable, a ſort of cherry. Pliny, lib. xxvi. cap. 11.

HERACLEONITES, ancient heretics of the ſect of the Gnoſtics; thus called from their leader, Heracleon.

St. Epiphanius, Hær. 36. is very ample on this hereſy.

He repreſents Heracleon as one who had reformed the theology of the Gnoſtics in many points; though, at bottom, he had retained the principal articles thereof. He refined on the ordinary interpretations of abundance of texts of ſcripture; and even altered the words of ſome, to make them conſiſt with his own notions.

He diſtinguiſhed two kinds of words; the one divine, the other corruptible; and reſtrained the word παντα, *all things*, to this laſt. He held, that the Word did not create the world immediately, and of himſelf; but only that he gave occaſion to the demiurgos to do it.

The Heracleonites, after the example of their maſter, annulled all the ancient prophecies; holding that St. John was really the voice that proclaimed and pointed out the Meſſiah; but that the prophecies were only empty ſounds, and ſignified nothing. They held themſelves ſuperior, in point of knowledge, to the apoſtles; and on that footing, dared to advance the moſt extravagant paradoxes, on pretence of explaining ſcripture in a ſublime, elevated manner. They were ſo fond of theſe myſtic interpretations, that Origen, though inclined to that mode of interpretation, was obliged to reproach Heracleon with his abuſing ſcripture by that means.

HERACLEOPOLIS, in *Ancient Geography*, a town of Egypt, which was the country of the philoſopher Theophanes.

HERACLEOTIS, an iſland of the Mediterranean, between Italy and Sicily, according to the Itinerary of Antonine.—Alſo, one of the Æolian iſles, now called *Baziluzzo*.

HERACLEUM, in *Botany*, from ἡρακλης, *Hercules*, an herb ſacred to him. The original plant is uncertain. Some have ſuppoſed it to be Yarrow, *Achillea*; others one of the umbelliferous tribe; all agree in attributing to it virtues of a vulnerary or healing nature. Bœhmer, in his Diſſertation upon plants named in honour of botaniſts, publiſhed at Wittenberg in 1770, has ſuppoſed this to have been called after Heraclides, the father of Hippocrates. Whatever may have been its origin, or primary application, it is now appropriated by Linnæus, Juſſieu, and moſt other writers, to the *Sphondylium* of Tournefort, or Cow Parſnep; though Gærtner retains the Tournefortian appellation. We cannot but think him more correct in this inſtance than in many others where he has contradicted, or refuſed to follow, Linnæus. The ancient *Heracleum* is, as he juſtly ſays, uncertain and enveloped in obſcurity, whereas there is little doubt of the Cow Parſnep being the σφονδυλιον of Dioſcorides.—Linn. Gen. 137. Schreb. 186. Willd. Sp. Pl. v. 1. 1421. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 1. 345. Sm. Fl. Brit. 306. Prodr. Fl. Græc. v. 1. 192. Juſſ. 222. Lamarck. Illuſtr. t. 200. (Sphondylium; Tourn. t. 179. Gærtn. v. 1. 86. t. 21.)—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Umbelliferæ*.

Gen. Ch. *General umbel* of many rays, very large; *partial* flat. *General involucrum* of many leaves, deciduous; *partial* halved on the outſide, its leaflets from three to ſeven, linear-lanceolate, the outer ones longeſt. *Perianth* ſcarcely diſcernible. *Cor. Univerſal* not uniform, radiated; flowers for the moſt part all fertile; *partial* of the *diſk* equal, of five inflexed, hooked, emarginate petals; of the radius unequal, of five oblong, hooked petals, the outer ones largeſt and moſt deeply cloven. *Stam.* Filaments five, longer than the petals of the diſk; anthers ſmall. *Piſt.* Germen inferior, nearly ovate; ſtyles two, approximated, ſhort; ſtigmas ſimple. *Peric.* Fruit elliptical, compreſſed, emarginate, ſtriated on each ſide in the middle. *Seeds* two, ovate, compreſſed, ſomewhat leafy at the edge.

Eſſ. Ch. Fruit elliptical, notched, compreſſed, ſtriated, dilated in the margin. Flowers radiant. Petals notched, with an inflexed point. General involucrum deciduous.

Obſ. Linnæus remarks that in ſome ſpecies the radiant flowers are female and fertile, thoſe of the diſk being deſtitute of ſtigmas, and conſequently abortive. He adds that *H. Sphondylium*, which comprifes the two firſt ſuppoſed ſpecies of Tournefort, has both organs perfect in all its flowers; while its involucrum is ſometimes altogether wanting.

A genus of the moſt gigantic umbelliferous plants; except perhaps *Ferula*, which is taller, and ſome ſpecies of *Laſerpitium*, whoſe leaves are more compound, and on the whole larger. Willdenow has 10 ſpecies; three new ones are defined in the *Prodr. Fl. Græc.*—The following examples are ſufficient.

H. *Sphondylium*. (Linn. Sp. Pl. 358. Engl. Bot. t. 939. Sphondylium; Rivin. Pent. Irr. t. 4. Ger. em. 1009. Raii Syn. 205.)—Leaves pinnate; leaflets dilated, pinnatifid, cut and ſerrated.—Native of thickets, hedges, borders of fields, and meadows, in moſt parts of Europe. Dr. Sibthorp found it in Greece, growing in wet places, as mentioned by Dioſcorides. It is the *Branca urſina*, or *Acanthus*, of ſome old herbaliſts, though very little reſembling the true one. The *root* is biennial, tap-ſhaped, whitiſh. *Stem* erect, branched, leafy, ſtout, hollow, furrowed and rough, about four feet high. *Leaves* large, ternate or pinnate, hairy, moſt downy and whitiſh beneath, variouſly pinnatifid, cut and ſerrated. The form of each leaflet is uſually broad and ſhort, heart-ſhaped at its baſe; but there is a long-leaved variety, miſtaken by ſome for the *anguſtifolium* of Linnæus. This variety, as Mr. Woodward remarked, ſometimes grows from the ſame root with the common ſort. It is repreſented in Petiver's Engliſh Plants, t. 24. f. 2. Whether it may be the *longifolium* of Jacquin, Fl. Auſtr. t. 174, and how far that and his *anguſtifolium*, t. 173, or *elegans*, t. 175, are diſtinct ſpecies, we find it difficult, even with his plates and ſpecimens before us, to decide, nor are the firſt European botaniſts agreed. The queſtion can be determined only by culture and repeated obſervation.

H. *anguſtifolium* of Linnæus, which by a miſtake found its way into the Fl. Brit. appears, by his herbarium, a very diſtinct ſpecies, the leaves being pinnatifid, with extremely long, narrow, decurrent, entire ſegments, rough at the edges only.

Whether *H. auſtriacum*, Linn. Sp. Pl. 359. Jacq. Auſtr. t. 61, which has pinnate leaves, and *H. alpinum*, Linn. Sp. Pl. 359, which has ſimple and lobed ones, well repreſented in Bauhin's Prodromus, p. 83, be diſtinct ſpecies, is another queſtion, which Seguier, a very exact obſerver, has decided in the negative.

H. *pumilum* of Villars, Delph. v. 2. 640. t. 14, is, on the other

other hand, ſo unlike the reſt, that at firſt one cannot but doubt its genus; yet the ſeeds remove every uncertainty. The *leaves* are twice ternate, ſmooth, and cut into many ſmall, elliptical, acute ſegments.

The three following ſpecies are hitherto nondeſcript, except the ſhort characters given in the *Prodromus Floræ Græcæ*.

H. *tomentoſum*. Sm. Prodr. Fl. Græc. v. 1. 192. Fl. Græc. inedit. t. 281.—Leaves repeatedly compound, downy, cut; their ſegments lanceolate, acute. Umbel of very numerous rays.—Gathered in Greece by Dr. Sibthorp, but in what particular ſpot is not recorded. The *root* is tap-ſhaped, annulated, apparently perennial, or at leaſt biennial, being crowned with old fibres from the leaf-ſtalks of the former year. Whole herb clothed with fine, white, ſoft, prominent down. *Stem* ſolitary, erect, near 18 inches high, ſimple, ſometimes with a few ſhort lateral branches, round, deeply furrowed, naked in the upper part. *Leaves* moſtly radical, a ſpan long, ſtalked, thrice pinnate, the main diviſions oppoſite, the reſt alternate; the ultimate ſegments ſpreading, lanceolate, acute, decurrent, nearly equal. Principal *umbel* terminal, ſolitary, a ſpan wide, denſe, ſlightly convex, of above 30, nearly horizontal, furrowed, rough rays; thoſe from the ſide branches much ſmaller. General and partial *involucrum* each of a few ſhort, awl-ſhaped leaves. *Flowers* perfectly white, radiant. *Seed* obovate, very flat, brown in the middle and ſlightly downy, encircled with an elevated oval ring in the otherwiſe flat border.

H. *aureum*. ibid.—Fl. Græc. ined. t. 282.—Leaves pinnate, lobed, cut, downy; the radical ones rounded. Umbel of about three rays. Stem much branched.—Gathered by Dr. Sibthorp on mount Parnaſſus. This has much of the aſpect of *Paſtinaca ſativa* in a wild ſtate, eſpecially from the full yellow colour of its *flowers*, whoſe general *umbels* conſiſt, for the moſt part, of three ſpreading rays, very rarely of two or of four, with but ſlight traces of a partial *involucrum*, and none of a general one. The partial *umbels* are ſmall and denſe. *Flowers* radiant, their petals concave. *Seed* orbicular, much compreſſed.—The *root* of this ſpecies is ſmall and biennial. *Stem* 18 inches or more in height, rough, furrowed, repeatedly and alternately branched. Radical *leaves* of two pair of heart-ſhaped, blunt, pinnatifid or three-lobed, cut leaflets, with a ſomewhat larger terminal one; ſtem-leaves ſmaller, narrower, and more acute.

H. *humile*. ibid. 193.—Leaves moſtly bipinnate, cut, downy. Stem but little branched. Seeds with four lines on their upper part.—Native of the Bithynian Olympus. *Sibth.*—*Root* perennial, very long. *Stem* ſcarcely a ſpan high. *Umbels* large in proportion, of from four to ſeven rays. *Seeds* pale, nearly ſmooth, orbicular, elegantly marked with four red lines, reaching from the middle to the ſummit on each ſide of the fruit.

Heracleum, in *Ancient Geography*, a place of Africa, in Egypt, which is placed by Strabo between Canopus and the Canopic mouth, and in which was a temple of Hercules.—Alſo, a promontory of Africa, in Marmarica. Strabo.—Alſo, a promontory of the Black ſea, to the weſt of the mouth of the Thermodoon, according to Ptolemy. Arrian places it between the rivers Iris and Thermodoon.—Alſo, a promontory of Aſiatic Sarmatia, upon the Black ſea, near the river Neſis, between the Borgys and Maſætica, according to Arrian.—Alſo, a town of the Tauric Cherſoneſus, on the weſtern ſide of the Palus-Mæotis; which, according to M. de Peyſſonnel, is now the fort of Ribat, at the entrance of the iſthmus, which ſeparates the *Sapra lacus* from the *Palus Mæotis*.—Alſo, a maritime town of Crete, called *Heraclea*, which ſee.—Alſo, a town of Aſia, in the Colchide, upon the coaſt of the Euxine ſea, near the mouth of the river Cianeſus, according to Pliny 70 miles from Sebaſtopolis.

HERACLEUS Lapis, in the *Natural Hiſtory of the Ancients*, a name by which many have called the loadſtone. This was the name given to it by the ancient Greeks from Heraclea, a city of Lydia, near which it uſed to be found; but ſubſequent writers ſo far erred from the origin and orthography of the word, as to call it *herculeus lapis*, as if it had been named from Hercules.

The after-ages of the Greeks called it alſo *magnetis lapis*, but this was a name by no means applied to it in the earlier times, but then was uſed to expreſs a very different ſubſtance, a white ſilvery-looking ſtone, which had no power of attraction, but was turned into beautiful veſſels for the uſe of the table; and the not attending to the ages in which the authors lived who uſed the word *magnetis*, has been the occaſion of great errors in their commentators, who did not conſider that in the ſucceſſion of a few ages, the ſame word became the name of two very different things. Hill's Theoph. p. 79. See Basaltes.

HERACLIA, Ἡρακλεια, in *Antiquity*, an Athenian feſtival celebrated every fifth year in honour of Hercules.

The Thiſbians and Thebans in Bœotia obſerved a ſolemn feſtival in honour of Hercules, ſurnamed Μηλεα, becauſe apples were offered to him. Beſides theſe there were other feſtivals kept in honour of Hercules; for a deſcription of all which, ſee Potter's Archæol. Græc. lib. ii. cap. 20. tom. i. p. 398, ſeq.

HERACLIAS, in *Geography*, an iſland in the Grecian Archipelago, about eight miles in circumference; five miles S. of Naxia. N. lat. 36° 49'. E. long. 25° 29'.

HERACLIDÆ, in *Antiquity*, the deſcendants of Hercules, whom the Greeks called Ἡρακλης, *Heracles*, from Ἡρα, *Juno*, and κλεος, *glory*, on account of the glory he acquired by executing what Juno induced him to undertake.

The Heraclidæ were expelled from Peloponneſus by Euriſtheus, king of Mycenæ, after the death of Hercules; in conſequence of the contention for the dominion of the peninſula ſubſiſting between the rival families of Perſeus and Pelops. The fortune of the Pelopidæ, however, prevailed; but their ſuperiority led them rather to perſecute, than to forgive, their enemies. The deſcendants and partiſans of the great Hercules, the moſt illuſtrious hero of the line of Perſeus, were diveſted of their poſſeſſions and driven into baniſhment. The exiles were firſt received by the Athenians, whoſe more humane, or more enlarged policy, rendered Attica, ever ſince the reign of Theſeus, the ordinary reſource of the miſerable. Their leader, Hyllus, was afterwards adopted by Epalius, the aged king of Doris; and the death of their benefactor ſoon made the Heraclidæ maſters of that mountainous province. But the wilds of Oeta and Parnaſſus were little adapted to ſatisfy men, whoſe anceſtors had enjoyed much more valuable poſſeſſions. Their natural ambition was long repreſſed by the increaſing greatneſs of the Pelopidæ, and the glory of Agamemnon. After the unexpected diſaſters of that prince, they twice attempted, unſucceſsfully, to break through the Corinthian iſthmus, and to recover their ancient dominion in Argos and Lacedæmon. Inſtructed by paſt miſcarriages, Temenus, Creſphontes, and Ariſtodemus, deſcendants in the 5th degree from Hercules, finally abandoned the hopeleſs deſign of entering the Peloponneſus by land. Determining, however, to make every exertion for regaining their hereditary eſtabliſhments, they prepared tranſports in every convenient harbour, at the northern extremity of the Corinthian gulf, which

which hence received the name of "Naupactus." The warlike and rapacious Ætolians, whose leader Oxylus was nearly related to the family of Hercules, assisted their labours, proposing to themselves a share in the booty which might accrue from the expedition. The Dorians, who inhabited the vicinity of mount Pindus, cheerfully deserted the gloomy solitude of their woods, in order to seek possessions in a more agreeable, and better cultivated country. Animated by these reinforcements, the Heraclidæ redoubled their diligence. By secret intrigues they secured a party in Lacedæmon; and before they set sail, they prudently detached a body of light-armed troops, whose appearance at the isthmus drew the strength of the enemy towards that quarter. In the mean while their armament was carried by a favourable gale towards the eastern coast of the Peloponnesus. The Heraclidæ (B.C. 1104) landed their forces without opposition, and assailed the defenceless territories to which they had long laid claim, comprehending the whole peninsula, except the central province of Arcadia, and the maritime district of Achaia. The five other provinces were conquered at the same time by different means. Laconia was betrayed to the invaders; Argos acknowledged their authority; Corinth, Elis, and Messenia submitted to their arms. The revolution was complete, but not without great oppression of the ancient inhabitants, many of whom emigrated, whilst many were reduced to slavery. The Heraclidæ, according to the custom of that age, divided their new acquisitions by lot. The kingdom of Argos fell to the share of Temenus; Cresphontes obtained Messenia; and, as Aristodemus happened then to die, Laconia was assigned to his infant sons, the twin brothers, Eurysthenes and Procles. Corinth was bestowed on their kinsman Aletes; and Elis given to Oxylus, their brave Ætolian ally. The rest of the territory was divided amongthe warlike Dorians and Ætolians, who had conquered for themselves, and not for their leaders; and who, having over-run, without opposition, the finest provinces of the Peloponnesus, would not be disposed to lead a life of hardship and misery in their native mountains. This partition of the Peloponnesus occurred in the year 1102 B.C. Gillies's Hist. Anc. Greece, vol. i. See PELOPONNESUS, and the next article.

HERACLIDÆ, *return of the*, into Peloponnesus, is a celebrated epocha in the ancient chronology.

The time of this return is differently assigned; because authors take the different attempts which they made to return, for the return itself. The first attempt was twenty years before the taking of Troy; the second was a hundred years later, or eighty years after the taking of Troy: B.C. 1104. This last is supposed to have succeeded; at least, according to Petavius, who mentions only these two. Rat. Temp. p. 1. lib. i. cap. 12. and Doct. lib. ix. cap. 30.

Scaliger distinguishes three attempts; and fixes the first fifty years later than Petavius; *viz.* thirty years after the taking of Troy. He says nothing of the second, which was unfortunate, like the first; but he places the third in the same year with Petavius. See the preceding article.

As it occasioned many changes and revolutions in the affairs of Greece, insomuch that scarce a state, or people, but were turned upside down thereby, the return of the Heraclidæ is the epocha of the beginning of profane history; all the time that preceded it, is reputed fabulous. Accordingly, Ephorus, Cumanus, Callisthenes, and Theopompus only begin their histories from hence. See CHRONOLOGY.

HERACLIDES of Pontus, in *Biography*, a physician and philosopher, was born at Heraclea, and was educated partly under Aristotle, and partly under Speusippus, a disciple of Plato. He wrote a treatise "On the Causes of Diseases," and another on "The Disease in which the Respiration is suspended," (περὶ τῦ ἄπνυ;) a disease which Empedocles boasted of having cured, when of thirty days duration. See EMPEDOCLES.

HERACLIDES of Tarentum, a physician of the sect of Empirics, on whom Cælius Aurelianus, Galen, and Aëtius have bestowed considerable praise. Galen considered him as the most eminent and able physician of that sect, and as having possessed a degree of knowledge and practical skill equal to that of any of his contemporaries. He seems to have made a more liberal use of active medicaments, especially of the narcotic class, than his predecessors; and was very industrious in his investigation of animal, vegetable, and mineral substances, with a view to enrich the catalogue of the materia medica. To the books which he wrote upon this subject, he gave the name of the individuals to whom he dedicated them, according to Galen, entitling one "Asclydamas," and another "Antiochis." He likewise wrote on the subject of diet, and the regimen to be observed in diseases, in which abstinence seems to have been pushed to a great extent. See Le Clerc. Hist. de la Medecine, part ii. Cæl. Aurel. Acutor. lib. ii. cap. 9.

HERACLITISM, in *Antiquity*, denotes the philosophy of Heraclitus, who was born at Ephesus, and flourished about the sixty-ninth Olympiad. This philosopher was the founder of a sect, derived from Pythagoras, the parent of the Italic school. In early life he manifested a propensity to the study of wisdom, and was initiated into the mysteries of the Pythagorean doctrine by Xenophanes and Hippasus, and afterwards incorporated them into his own system. He declined the supreme magistracy of Ephesus, which was offered him; and when he was afterwards observed to be playing with the boys in the court of the temple of Diana, and asked why he was not better employed, he replied "it is surely better to pass my time with children, than to govern the corrupt Ephesians." With his fellow citizens he was displeased for having banished a man so wise and able as Hermodorus; and being of a melancholy and splenetic temper, he despised the ignorance and follies of mankind, shunned public intercourse with the world, and devoted himself to retirement and contemplation. His place of residence was a mountainous retreat, and his food the natural produce of the earth. When Darius, having heard of his fame, invited him to his court, he treated the invitation with contempt. His diet, and mode of life, at length occasioned a dropsy, for which he could obtain no relief from medical advice; and he therefore attempted to cure himself, by shutting himself up in a close stable of oxen. The event is doubtful, and the manner of his death, which happened at the age of 60 years, is not ascertained. Of Heraclitus it has been reported that he was perpetually shedding tears on account of the vices of mankind, and particularly of his countrymen. But the fable is probably as little founded as that of the perpetual laughing of Democritus. The poet describes them both:

> "——De Sapientibus, alter
> Ridebat, quoties a limine moveret unum
> Protuleratque pedem; flebat contrarius alter."
>
> Juvenal.

> "Will you not now the pair of Sages praise
> Who the same end pursued by different ways?
> One pitied, one contemn'd the woeful times;
> One laugh'd at follies, and one wept o'er crimes."
>
> Dryden.

The writings of Heraclitus were compriſed in a treatiſe, which, according to Laertius, contained a continued diſcourſe on nature, and was divided into three books; one concerning the univerſe; the ſecond, concerning politics; and the third, of theology. This book he depoſited in the temple of Diana; and it is ſaid that he affected to write obſcurely, leſt it ſhould be read by the vulgar, and become contemptible. Accordingly he obtained the name of Σκοτεινος, the obſcure philoſopher; appropriated to him by the unanimous conſent of the ancients. It is ſaid by Tatian, that the poet Euripides, who frequented the temple of Diana, committed the doctrines and precepts of Heraclitus to memory, and accurately repeated them. The fragments of this work are preſerved by Sextus Empiricus, and it appears to have been written in proſe, a circumſtance which invalidates the above relation of Tatian.

According to Heraclitus, reaſon, by means of the ſenſes, is the judge of truth. This common and divine principle is derived by inſpiration from that which ſurrounds us. In dreaming, the paſſages of the ſenſes are obſtructed, and the connection of the human mind with that which ſurrounds us is interrupted; on waking, this connection is reſtored, and the power of reaſon returns. All common maxims, being comprehended by common and divine reaſon, are to be received as true. Fire is the principle from which all things in nature are produced: this principle conſiſts of ſmall indiviſible parts or atoms, in their nature ſimple, and duration eternal, and in continual motion. From the combination of theſe elementary fire and all the forms of nature are produced; and into theſe, at certain periods, they are all reſolved. This ſelf-moving fire is underived and eternal, and having within itſelf neceſſary motion, its force produces the ſyſtem of nature. This principle is the ſoul of the world, and is God, δημιουργος, the maker of all things. Fire condenſed is water; water farther condenſed is earth; and *vicê verſâ*. The heavenly bodies are in the form of boats, preſenting to us the hollow ſide; and they become luminous when certain fiery exhalations from the earth are collected within them. The ſun is no larger than he appears to the ſight, and becomes eclipſed when its convex ſurface happens to be turned towards the earth. The moon is of the ſame form and nature; and its monthly variations are occaſioned by the gradual changes of its poſition towards the earth, from concave to convex, and the reverſe. All the ſtars are nouriſhed by exhalations from the earth, and theſe, as they are more or leſs ſplendid and warm, cauſe the variations of day and night, of the ſeaſons, and of weather. Of the nature of the ſoul, Heraclitus ſpeaks with heſitation and doubt; but he thinks it moſt probable, that it is an exhalation from the fiery ſubſtance, which pervades all things, and is the ſoul of the world, paſſing into human bodies through the ſenſes. All nature is full of ſouls, or dæmons. Human ſouls are liable to perpetual changes; and being loaded with moiſt vapours, they paſs into the watery maſs and periſh; but when purified from theſe, they return into the ſoul of the world.

Although this philoſopher introduces into his ſyſtem the term God, he ſeems to uſe it for expreſſing, not a diſtinct being of a peculiar nature, but merely that innate force in the primary fire, by means of which its particles have been in eternal motion, and have at length united to form the preſent regular ſyſtem of nature. To this force, conſidered as diſtinct from the matter to which it belongs, he gave the appellation of God; and he called it rational and divine, becauſe the effects, which he aſcribes to it as a cauſe, were produced in a regular ſeries, and according to a certain and immutable law.

On the ſubject of morals, Heraclitus taught, that the end of life is to enjoy happineſs; that for this purpoſe it is neceſſary to repoſe the body and confine its wants within as narrow limits as poſſible; that it is of greater importance for men to know themſelves than to acquire extenſive learning; that human life is, in fact, the death of the ſoul, as, whilſt it continues in the body, it is confined and depreſſed, and never gains its true freedom and activity, till it returns to the divine nature from which it proceeds; that the firſt virtue is temperance, and the firſt leſſon of wiſdom to follow nature; and that all human laws are founded upon one divine law of neceſſity, which governs all things.

The Stoics were indebted to Heraclitus for many parts of their phyſical and moral doctrine. Many ſubſequent philoſophers taught his ſyſtem, or incorporated it with their own. Plato, learning it from Cratylus, adopted that part of it which treated of the nature and motion of matter. The Heraclitean ſect, however, ſeems to have been of no long duration, as no traces of its exiſtence are diſcernible after the death of Socrates: which was owing, partly to the obſcurity of the writings of Heraclitus, and principally to the ſuperior ſplendour of the Platonic ſyſtem by which it was ſuperſeded. Among the philoſophers of Athens, Heraclitus maintained a conſiderable degree of reputation, as we may infer from the great pains taken by Zeno to transfer ſeveral tenets of the Heraclitean ſyſtem into his own. Among the admirers of Heraclitus we may reckon *Hippocrates*. (See his article.) Brucker's Philoſ. by Enfield, vol. i.

HERACLITUS, the Sicyonian, was author of a treatiſe on ſtones, which Plutarch has quoted in the ſecond book of his treatiſe on rivers, when ſpeaking of the Scamander. To him has been aſcribed a work entitled "De Incredibilibus," the MS. of which was found in the Vatican library. It was printed at Rome in the year 1641, and it has been reprinted at London and Amſterdam. Moreri.

HERACLIUS, emperor of the Eaſt, ſon of the governor of Africa, of the ſame name, was ſent by his father with a fleet from Carthage to Conſtantinople to relieve the people from the tyranny of Phocas. The objects of his miſſion he performed ſo well, that he was himſelf inſtantly raiſed to the throne. This was in the year 610, a period when Choſroes, king of Perſia, was extending his conqueſts over the whole of the Aſiatic empire. The enemy had at length ſubdued and over-run all the Thracian provinces as far as the long wall of Conſtantinople, and Heraclius was preparing to quit his capital, and had put his treaſures on board the fleet, when the patriarch and clergy extorted from him a promiſe not to deſert his people: and they readily ſacrificed the wealth of their churches, in order to enable him to make head againſt his enemies. He ſolicited peace from the Perſian monarch, who was ſo inflated with ſucceſs as to demand an exorbitant tribute, and to inſiſt upon the emperor becoming a worſhipper of the ſun. Heraclius had paſſed ſeveral years in a kind of inglorious indolence, when Choſroes, by his unjuſt demand, forced him to become a hero. He now changed the imperial purple for the garb of a warrior, and, by ſtrict diſcipline, put his army on the moſt reſpectable footing. A battle enſued, in which the emperor obtained a complete victory over the Perſian army; after this he paſſed mount Taurus, marched through Cappadocia, and eſtabliſhed his winter quarters on the banks of the Halys. He returned to Conſtantinople, and in the ſpring of 623 purſued his ſucceſſes, ravaging the Perſian territories, deſtroying the temples of the Magi, and delivering a great number of Chriſtian captives. He paſſed the following winter near the ſhores of the Caſpian ſea. In another campaign he had the glory of recovering three hundred Roman ſtandards,

ſtandards, and liberating from their thraldom a vaſt number of captives. This career of ſucceſs was fatal to Choſroes, who was depoſed by his own ſubjects, and his ſon placed on the throne. A treaty of peace followed in 628, by which the new Perſian king reſtored all captives, put an end to the perſecution of the Chriſtians, renounced his father's conqueſts upon the Roman empire, and gratified the piety of Heraclius by the reſtitution of the true croſs, as it was called, taken from Jeruſalem. This precious relict was in the next year replaced by the emperor on a religious viſit to the holy ſepulchre, an event which was the cauſe of a feſtival denominated "The Exaltation of the Croſs." Towards the cloſe of life, Heraclius engaged in religious controverſies, and withdrew from thoſe active cares which ſo glorioufly diſtinguiſhed the middle period of his life. He was a zealous diſciple of MONOTHELISM (which ſee), to which he adhered as long as he lived. He divided the ſucceſſion to the empire between his eldeſt ſon Conſtantine, and Heracleonas, a ſon by Martina, a ſecond wife, his own niece. To this act he had been urged by the ſolicitations of his wife. Conſtantine enjoyed, in a mature age, the title of Auguſtus, but the weakneſs of his conſtitution, it was urged by his mother-in-law, required a colleague and a guardian, and he yielded with reluctance to a partition of the empire. The ſenate was ſummoned to the palace to ratify or atteſt the aſſociation of Heracleonas, and the impoſition of the diadem was conſecrated by the prayer and bleſſing of the patriarch. The ſenators and patricians, with their uſual ſervility, adored the majeſty of the great emperor, and the partner of his reign. The ceremonies were afterwards repeated in the cathedral, and the concord of the royal brothers was affectedly diſplayed by the younger leaning on the arm of the elder. After this the emperor ſoon fell into a dropſical diſorder, which, as he was attempting to enforce his religious opinions, carried him off in February 641, in the 31ſt year of his reign. Gibbon.

HERÆA, Ἡραια, in *Antiquity*, a feſtival celebrated at Argos in honour of Juno, called, in Greek, Ἡρη. See a deſcription of the ceremonies attending this ſolemnity, in Potter's Archæol. Græc. lib. ii. cap. 20. tom. i. p. 397.

There was another feſtival of this name, celebrated every fifth year in Elis, where ſixteen matrons were appointed to weave a garment for the goddeſs.

There were other ſolemnities of this nature. See Potter, loc. cit. ſeq.

HERÆA, in *Ancient Geography*, a town of Arcadia, near the river Alpheus, S. W. of Telphuſa. Its ſituation was pleaſant, and it derived its name from Hereus, the ſon of Lycaon. Along the Alpheus were the horſe-courſes, the baths, two temples dedicated to Bacchus, and a ſacred place in which were celebrated the Orgia. Pan alſo had a temple in this town. After undergoing ſeveral viciſſitudes, and at the cloſe of the war againſt Philip, when the Romans were diſpoſed to give liberty to the Greeks, in the year 196 B.C. Heræa recovered many of its privileges.

HERÆUM, derived from Ηρη, the name given by the Greeks to Juno, denoted the temple conſecrated to her honour and worſhip. Of this kind there were ſeveral: *e. g.* the temple of Juno between the grove, ſacred to Argos, and the town of Argos:—another, or perhaps the ſame, in the Argolide, which, according to Strabo, was ſituated 40 ſtadia from Argos, and 10 from the town of Mycenæ, embelliſhed with a lofty ſtatue of Juno, conſtructed of ivory and gold, a golden peacock enriched with precious ſtones, and other ornaments:—a temple of Juno in Bœotia, 20 ſtadia diſtant from the fountain Gargaphia:—and another in the iſland of Samos, conſtructed by Rhœcus, the ſon of Philæus, who, with Theodore of Samos, invented the art of making moulds of clay, which were caſt in a font of braſs for making ſtatues.—Alſo, a town of Thrace, built by the Samians, and ſituated near Perinthus.

HERAKLI, anciently HERACLEA, in *Geography*, a town of European Turkey, in Romania, in which are the ruins of an amphitheatre, built by the emperor Severus, on the north coaſt of the ſea of Marmora; the ſee of a Greek archbiſhop; 45 miles W. S. W. from Conſtantinople. N. lat. 40° 53′. E. long. 27° 54′.

HERAKRA, a town of Sweden, in the province of Smaland; 30 miles N. W. of Calmar.

HERALD, an officer of arms, anciently in great repute, and poſſeſſed of ſeveral conſiderable functions, rights, and privileges. They were ſubject to the ſovereign and the two great officers denominated *Conſtable* and *Marſhal*, (ſee each term,) and executed their commands.

The word *herald*, according to Du-Cange, comes from the Saxon *here*, or German *heer*, *army*, and *ald*, *ſervant*; becauſe chiefly ſerving in the army. Others will have the two words ſignify *champion of the army*; in alluſion to their office of denouncing war, proclaiming peace, &c. Du-Cange adds, that they were called *clarigarii*, as well as heralds. Borel derives the word from the Latin *herus*, *maſter*; q. d. one coming from his maſter; others from *herbaut*; q. d. *high lord*; others from *herold*, which is the ſame with *dominus veteranus*; and others, laſtly, from *heer*, *maſter*, or *army*; and *hold*, q. d. *bound to his lord*, or the *army*. For a variety of conjectures with regard to the etymology of this appellation we refer to Edmondſon's "Complete Body of Heraldry," vol. i. p. 81—83.

The origin of herald is very ancient; and the advocates of its antiquity have detailed many fables, which it is needleſs for us to recite. Stentor is repreſented, by Homer, as herald of the Greeks, who had a voice louder than fifty men together. The Greeks called them κηρυκες, and ιερομνημονες; and the Romans *feciales*.

The Romans had a college of heralds, appointed to decide whether a war were juſt or unjuſt; and to prevent its coming to open hoſtilities, till all means had been attempted for deciding the difference in a pacific way.

As to the era of the appointment of heralds, ſome writers have contented themſelves with ſuppoſing, that the office was contemporary with the diſtribution of ſubjects into nobles and commoners; whilſt others have referred their origin to that period, in which princes firſt engaged in wars, which, as we have reaſon to lament, muſt have been very remote; and ſome, without pretending to this unwarrantable antiquity, have affixed it at a much later date. As to the country in which it originated, there is hardly a nation throughout Europe, not to extend our views to other quarters of the globe, to which the firſt inſtitution of heralds hath not been attributed. In this inveſtigation ſome have contended, that the office was firſt erected by thoſe people, from whoſe language the appellation of herald is derived. But this kind of argument involves the difficulty of aſcertaining its etymology. Æneas Sylvius, in an epiſtle written in the year 1451, refers to a MS. about heralds, which he had ſeen in St. Paul's church, London, compiled, as he aſſerts, about 600 years before that time: and admitting the alleged antiquity of ſuch a MS. it would lead us to allow the exiſtence of heralds to be as early as the year 851; and it would ſerve to vindicate the long and much ſuſpected genuineneſs of the ſtatute about tournaments, ſaid to have been made by the emperor Henry I., in the year 938, in which are mentioned kings of arms, heralds, and their reſpective duties. But ſir Henry Spelman hath inconteſtibly proved, that this MS.

ought to be referred to the time of the emperor Charles IV., and not to that of Charlemagne, when Æneas Sylvius imagined it to have been written. Mutius has furniſhed us with a conſtitution of Frederick Ænobarbus, who came into the empire in 1152, about the immunity of heralds, which is leſs exceptionable than the above cited ſtatute of Henry I. Accordingly the eſtabliſhment of heralds has been referred by a learned and noble author to an event that occurred about this period, conjecturing that they owed their origin to the cruſades, or expeditions into the Holy Land; and this opinion has been adopted by many modern writers. The duties aſſigned them, and the purpoſes for which they were firſt intended, could they be ſatisfactorily aſcertained, would aſſiſt in the inveſtigation of their origin. The emperors, it is ſaid, were accuſtomed to take under their protection, ſuch of their moſt experienced and valiant ſoldiers of gentilitial birth, who had been grievouſly wounded or maimed in their wars; and theſe ſoldiers were diſtinguiſhed by the name of "Veterans." To their judgment and counſel the emperors paid great deference, and their attendance on the perſons of their maſters became neceſſary. The emperors employed them in negotiating matters that were litigated with their enemies and rebellious ſubjects. In the performance of theſe duties they gained confidence and reſpect from all parties. The inſtitutions of juſts, tilts, and tournaments, which originated in Germany, opened a new field for the employment of theſe Veterans. The feudal ſyſtem alſo began to ſpread itſelf over the weſtern and northern parts of Europe nearly about the ſame time when tilts and tournaments became faſhionable, and ſerved to introduce and eſtabliſh tenures by knights' ſervice. Tenants of this deſcription, in order to their being readily known and diſtinguiſhed, aſſumed ſome particular device or token, which they bore on their banners, targets, and ſhields; and ſuch devices afterwards called arms, became the gentilitial tokens and enſigns of the families that had ſo aſſumed them. Thus alſo, the challengers, who offered to engage in tournaments, tilts, and juſts, in proof of their gentility, hung up at the entrance of the lids, ſhields charged with their devices and ſymbols; and the caſe was the ſame with thoſe who accepted the challenges. No one who had not a certificate from the veterans of his being a gentleman, and of which his device, ſymbol, or arms, was the criterion, was permitted to tourney. The veterans were, therefore, obliged to acquaint themſelves, not only with the enſigns of princes, but with the diſtinct devices each family had aſſumed to itſelf. Upon the introduction of the cruſades, towards the latter end of the 11th century, theſe veterans would be ſelected as proper perſons for carrying on a correſpondence between the confederated princes; and as each prince had then his peculiar ſymbol, and armorial enſign, what could be more obvious than the inveſting the meſſengers with a coat of arms ſimilar to that borne by his prince, which would ſerve to ſanction and accredit them, and contribute to their ſafety and reception? As theſe meſſengers paſſed frequently to and fro through the army, they became particularly acquainted with the enſigns borne throughout the hoſt; and of courſe they would be ſtyled "heralds," either as the ſame was the language of the prince who commanded, or of him who primarily either propoſed ſuch an expedient, or firſt thus equipped an officer, or upon ſome other account not now to be diſcovered. Soon after this time, the word *Heraldus* occurs in the Imperial Conſtitutions of Frederick Ænobarbus, and they provided for the ſafe paſſports and inviolable ſecurity of ſuch officers. With equal probability it may be further conjectured, that the benefit which the princes then in alliance and confederacy derived from ſuch an officer, was ſo evident, that after their return into their own countries, they retained this manner of intercourſe, which was at length extended to all meſſages to be ſent, and to all negotiations to be carried on and concluded, between friends and enemies.

It is not eaſy to determine when the office of *heralds*, under that or any other appellation, was firſt introduced into England. The oldeſt public muniments, in which any mention is made of Engliſh heralds, are a pell-roll of the twelfth of king Edward III., and a wardrobe account of the ſame year; and yet it is certain that they were eſtabliſhed in this kingdom long before that time. From facts furniſhed by ſir Henry Spelman, we may infer, that England had *its heralds* at the commencement of the reign of king Edward I., and that they were then actually divided into claſſes. Some have ſuggeſted, without ſufficient reaſon, that the office of an herald was known to the Saxon monarchs. When the Normans invaded England, offices of this deſcription were unknown. Robert, the conqueror's eldeſt ſon, who undertook an expedition into the Holy Land, it may be reaſonably ſuppoſed, became acquainted with the inſtitution of heralds; but after his return he does not ſeem to have eſtabliſhed ſuch officers in his dukedom of Normandy. Richard, ſurnamed Cœur de Lion, who was the firſt of our monarchs that perſonally engaged in the cruſades, muſt have been acquainted with the office and utility of heralds; but they had been eſtabliſhed in Germany, and alſo in France, and elſewhere, long before that period; and, therefore, it is not likely that he ſhould primarily have introduced them into England. Henry Fitzempreſs muſt have been well acquainted with their eſtabliſhment and importance in the empire before he aſcended the Engliſh throne; and his intercourſe afterwards with France, Germany, &c. muſt have occaſioned the heralds of other princes to have been frequently ſent to him. Hence, and from other collateral circumſtances, we may conclude, that heralds were tranſplanted either from Germany or France, and that they gained an eſtabliſhment in England ſome time in that monarch's reign, and that they grew up from this period to that ſtate in which we find them at the beginning of the reign of king Edward I. It is not improbable that Engliſh heralds, like thoſe of Germany, were originally choſen out of the veteran ſoldiers; becauſe their functions were the ſame, and military men were beſt qualified to execute them. "The primary duty of Engliſh heralds," ſays Edmondſon, "at the time of their eſtabliſhment, quadrated exactly with that of the heralds of foreign princes, in carrying and delivering all meſſages of importance to allies, enemies, and rebels; in giving ſolemn defiance and denunciations of war; in ſummoning cities, caſtles, &c. to ſurrender; in making propoſitions of peace, truce, and accommodation; and in offering mercy and pardon to rebellious ſubjects and inſurgents. At the times of ſigning leagues, truces, and treaties of peace and alliance, they attended the legation, and ſometimes were joined in it; honours, which they occaſionally enjoyed until the reign of Henry VII." By this admiſſion of the heralds to a ſhare in public negociations, they acquired importance; they had eaſy acceſs to the ſovereign; they became reſpectable and confidential; and they were placed in ſuch a ſtate as ſecured to them ample allowances, fees, and rewards, together with conſiderable privileges and immunities, among which was an exemption from all taxes, aids, and aſſeſſments. From the time of their introduction into this kingdom, they were in every reſpect the immediate and ſubordinate miniſters of the conſtable and marſhal of England, and as ſuch executed the orders, and aſſiſted in the management and conduct of the ſeveral branches of duty within the departments

of

of thoſe two great officers. Hence it was, that they had the cognizance, inſpection, marſhalling, and regulations of coats-armour, and the ſeveral marks of diſtinction relating to them; that they received all foreign nobility and others coming to England, to perform feats of arms, and gave them ſafe conduct from the time of their arrival to that of their leaving the kingdom; that they aſſiſted at all tilts, tournaments, and feats of arms, and that they had a very conſiderable charge and interference in the order and progreſs of legal combats. Hence, alſo, they were employed in marſhalling and conducting coronations, marriages, baptiſms, funerals, interviews, and thoſe other auguſt aſſemblies, proceſſions, pomps, and ſolemnities, in which conſiſted the ſplendour and magnificence of our ancient monarchs; in taking care that the orders, rites, and ceremonies, fixed for the guard and ornament of thoſe ſhows and triumphs were duly obſerved; in ſeeing that the rules of precedency were ſtrictly regarded, and in preventing all confuſion and diſputes that might otherwiſe happen to diſturb them.

Our kings, anciently, not only created heralds with their own hands, and with magnificent and expreſſive rites, in the moſt public manner, and on the moſt ſolemn feſtivals, chriſtening them by pouring wine on their heads from a gold cup, and giving them their herald's name, which is now done by the earl marſhal; but in order that they might bear ſome external and conſpicuous tokens of their rank and character, inveſted them, agreeably to the practice of other princes, with the royal military habit, or ſur-coats of the ſovereign's arms, the known ſymbo s of authority and honour; and commanded them to wear ſuch ſur-coats, as enſigns of their office, when they were in execution of any branch of their duty. Their perſons, being thus habited and diſtinguiſhed, were kept ſacred and inviolable; they paſſed with ſafety through foreign dominions, unmoleſted even by enemies in times of war, in the field, or in the hour of battle; on the contrary, they were permitted free acceſs to thoſe princes with whom their ſovereign was at variance, and were diſmiſſed by them with ſafe conduct to the dominions of the king their maſter. At the time of their creation by the earl marſhal, they take the oath of an herald on the ſword, and are inveſted with a tabart of the royal-arms, embroidered on ſatin, not ſo rich as that of the kings, but better than the purſuivants', and a ſilver collar of SS. Amongſt the nobility we alſo find heralds in their funeral rites and ceremonies, as well as in the celebration of their marriages, chriſtenings, and other feſtivities, exerciſing the ſame forms and ſuſtaining the ſame grandeur as in thoſe of the royal family. The management of all public ſhows and triumphs was committed by the ſovereign to their care and conduct; and, in ſhort, the heralds, being thus qualified, were uſually engaged to form, regulate, and ſuperintend ſuch feſtivities and ſolemnities as the nobility determined to have obſerved and performed on any occaſion that reſpected their own families, or which they apprehended would redound to their honour and aggrandizement. When family arms became the external criterion which diſtinguiſhed the gentleman from the peaſant, and it was neceſſary, in any feat of arms, that perſons ſhould prove themſelves to the ſatisfaction of the heralds to be gentlemen of coat-armour, our gentry took care to have their arms embroidered on their common-wearing ſur-coats, and would not ſuffer inferior perſons, although maſters of acquired wealth, to uſe ſuch token of gentilitial diſtinction. So jealous indeed were they of any infringement of the armorial rights to which they were entitled, that whenever the arms which they and their families had borne, happened to be claimed by any other gentleman, they vindicated their rights even by duel. It became neceſſary, therefore, for the heralds to draw out with accuracy the authentic genealogies of noble and gentiliteal families; to continue from time to time, and preſerve their pedigrees in direct and collateral lines; and to have a perfect knowledge of all hereditary arms, enſigns armorial, badges of honour, and the outward marks as well of perſonal as of family rank and diſtinction. Theſe parts of heraldic employment have been ſubſervient to ſeveral important purpoſes, beſides thoſe for which they were originally undertaken. Genealogical tables, and authentic pedigrees, regularly deduced, contain memorials of paſt tranſactions and events; and from them chronologers and hiſtorians have derived conſiderable aſſiſtance; they have alſo operated to the detection of frauds, forgeries, and impoſtures; eſtabliſhed marriages; defended legitimacy of blood; aſcertained family alliances; proved and maintained affinity and conſanguinity; vindicated and corroborated the titles of lands to their poſſeſſors; and have furniſhed effectual evidence for ſettling claims and rights of inheritance.

The original viſitation books of heralds, compiled when progreſſes were ſolemnly and regularly made into every part of the kingdom, to inquire into the ſtate of families, and to regiſter ſuch marriages and deſcents as were verified to them upon oath, are allowed to be good evidence of pedigrees. (Comb. 63.) And it is much to be wiſhed, ſays judge Blackſtone, that this practice of viſitation at certain periods were revived; for the failure of inquiſitions *poſt mortem*, by the abolition of military tenures, combined with the negligence of the heralds in omitting their uſual progreſſes, has rendered the proof of a modern deſcent, for the recovery of an eſtate or ſucceſſion to a title of honour, more difficult than that of an ancient. This will be indeed remedied for the future, with reſpect to claims of peerage, by a late ſtanding order of the houſe of lords (11 May, 1767); directing the heralds to take exact accounts and preſerve regular entries of all peers and peereſſes of England, and their reſpective deſcendants; and that an exact pedigree of each peer and his family ſhall, on the day of his firſt admiſſion, be delivered to the houſe by garter, the principal king at arms. But the general inconvenience affecting more private ſucceſſions, ſtill continues without a remedy.

The modern heralds, *i. e.* thoſe we properly call heralds, have loſt a good deal of the diſtinction and office of the ancient ones. What relates to the making out arms, the rectifying of abuſes therein, &c. is chiefly committed to the king at arms. And in the army, drums and trumpets have ſucceeded to the functions of heralds, being ſent by the generals on the ſame errands; and on that account enjoying the ſame rights and privileges. Their perſons are under the protection of the law of nations, when they bear the marks of their offices publicly, *i. e.* the trumpeter his trumpet, and the drummer his drum; in the ſame manner as the herald his coat.

The moſt common diſtinction of theſe officers hath been into claſſes or degrees, *viz.* kings, heralds, and purſuivants of arms. All theſe three orders are ſtyled heralds, which may not be a very improper attribute to the kings of arms; becauſe the order of a herald is comprehended within that of a provincial king: the office of ſuch a king having in it the office of a herald, *ex vi ordinis*, and ſomething more; for to be a herald, was but a ſtep to the kingſhip, as the being a purſuivant, or a novice, to the office of a herald. Theſe orders, or degrees, bear the impreſs of a diſtinct character; that is, the perſon who is created king of arms is qualified with a new capacity to perform certain functions, which before his new promotion, whilſt he was only a herald, he had no power to do; but

but the purſuivants, being only candidates, probationers, or noviciates, and not really officers, were therefore very improperly included under the term herald. It has been ſaid, that perſons could not arrive at the dignity of herald, without having been ſeven years *purſuivant*, (which ſee,) and that they could not quit the function of herald but to be made king at arms.

Heralds, being at firſt military men, had on that account only, as it has been ſaid, the addition of "armorum," "ad arma," and "d'armes," and not upon any relation to coats-armour, or enſigns of honour. Indeed, coat-arms themſelves originally belonged to no other than military men, as Mr. Selden, in his "Titles of Honour," hath fully proved. Sir Henry Spelman is of opinion, that the title of king of arms was attributed to ſuch officers in England as belonged immediately to the king's majeſty; whilſt thoſe who appertained to princes of the blood-royal, or to the nobility, were ſimply ſtyled heralds.

For an account of kings of arms, ſee KING *of arms*.

Of the ſix heralds in England, who have had a long ſucceſſion, and continued to receive ſalaries from the public, *Windſor* has his denomination from the royal caſtle or palace; *Cheſter*, *Lancaſter*, *Richmond*, *Somerſet*, and *York* from counties or ſhires, which have at ſundry times, as ſir Henry Spelman obſerves, been the honours or appendages of the younger ſons of the crown. And indeed we find the heralds with moſt of theſe titles, ſometimes belonging to the ſovereign, and ſometimes to the nobility, who had theſe honours. We ſhould obſerve, however, that although their titles are taken from territories or earldoms, yet theſe officers are not local as to any particular charge or juriſdiction to be executed in thoſe places only; for no one herald is either circumſcribed within any province, or excluded from officiating within the precincts of thoſe counties whoſe titles are borne by others, but the titles are merely nominal, as they are officers at large, ſomewhat like titular biſhops. *Cheſter* herald is ſaid by ſir Henry Spelman to have been inſtituted under Edward III.; but though no ſuch officer is mentioned in any of the records of that king's reign, it is certain that he was a known and eſtabliſhed herald in the time of Richard II. From that time a regular ſucceſſion hath been continued in that office. During the reigns of Henry IV., Henry V., and Henry VI., there was a king of arms, by the appellation of *Lancaſter*; but the firſt record in which a *Lancaſter* herald is mentioned, is a privy ſeal for a protection granted by the prince of Aquitaine and Wales, *i. e.* the Black prince, who had thoſe titles from the 36th to the 47th year of Edward III; and though the title of *Lancaſter* herald doth not occur in any records from the firſt year of Henry V., until the 18th year of king Henry VI., yet from that time to the preſent the ſucceſſion hath been regularly continued. *Richmond* was a title given to an officer of arms belonging to the nobility as well as to the crown. The title of *Richmond* herald occurs in the eighth year of Henry VI., likewiſe in the 12th year of Edward IV., in the reign of Henry VII., in the ſecond year of Henry VIII., from which time the ſucceſſion hath continued. *Somerſet* is a title, which, like the preceding, ſometimes belonged to a herald of the nobility, and at others to a herald of the crown. Some have referred the creation of *Somerſet* herald to the reign of Henry VIII., but it appears that Henry VII., in his 9th year, conſtituted an officer under this title. Difficulties occur in making a due diſtinction between *Windſor* king of arms and the herald of arms, denominated *Windſor*. About the eighth year of Edward IV. a *Windſor* herald is expreſsly mentioned. From about the year 1502, the ſucceſſion of Windſor heralds hath been uninterruptedly continued. The earlieſt record in which the *York* herald is mentioned is a patent-roll of the firſt year of Richard III. From the reign of Henry VII. to the preſent time, the ſucceſſion hath been uninterrupted.

After the ſix titles already enumerated, in which a ſucceſſion hath been continued down to this time, it may not be improper to mention ſome others, who were probably heralds to the nobility, and took their titles from the counties, cities, and places which had, at ſome time or other, been dukedoms or earldoms: ſuch were Arundel, Bedford, Buckingham, Carliſle, Clarence, Cornwall, Derby, Dorſet, Exeter, Glouceſter, Hertford, Hereford, Huntingdon, Leiceſter, Northampton, Nottingham, Norfolk, Northumberland, Pembroke, Saliſbury, Shrewſbury, Suffolk, Wales, Warwick, and Worceſter. Some of our heralds have derived their titles from provinces and territories which either are or formerly have been ſubject to our ſovereigns, as Bourdeaux, Brunſwick, Guienne, Guiſnes, Hanover, Maine, &c. The arms, quarterings, ſupporters, and badges of the crown, have alſo given denominations to heralds; ſuch are Faucon, Fleur-de-lis, Leopard, Roſe, and Blanc Courſier. This is likewiſe the caſe with reſpect to places where ſignal victories have been obtained; as Agincourt and Nazer. Others, again, from ſome collateral circumſtance, which it is not neceſſary to mention.

For ſome ages paſt the crown hath occaſionally iſſued a warrant directed to the earl marſhal, commanding him, in the name and on behalf of the king, to create the perſon named, an *herald extraordinary*, by ſome title expreſſed in ſuch warrant, and different from any of thoſe given to the uſual heralds in ordinary, and to inveſt him with the privileges belonging to ſuch office. No ſalary is annexed to the office, but merely his creation with ceremony takes place in purſuance of the warrant. This diſtinction of heralds doth not occur before the 19th year of Henry VIII. The creation of ſuch heralds, ſays Edmondſon, has uſually occurred when there was a plenarty in all the titles of thoſe in ordinary, and it has been adopted ſometimes with a deſign that theſe new officers ſhould, in preference to the ſenior purſuivant, ſucceed in the firſt vacancy that might happen in any of the titles in ordinary, and then have a patent with a ſalary from the crown; ſometimes, in order that the perſon favoured might, immediately after his creation, be promoted to the next vacant kingſhip, as it were *per ſaltum*; it being an eſtabliſhed rule, ſays Anthony Wood (Athen. Oxon.) that no man can be made a king of arms, before he is an herald; and at other times to enlarge the number of heralds, for the better and eaſier performance of the ſervices required by the crown, from the officers of arms. The three heralds extraordinary are *Arundel*, *Norfolk*, and *Mowbray*. The office of the heralds, ordinary and extraordinary, is to wait at court, to order and attend public ſolemnities, as coronations, inſtallations, funerals, &c. to proclaim war and peace, to attend to the regulation of the bearings of arms, and to ſearch pedigrees, &c. under the authority of the earl marſhal and his deputy.

The ſix heralds, with the three kings at arms, and the four purſuivants, are a college, (which ſee,) or corporation; erected into ſuch by charter of Richard III. who granted them divers privileges, as to be free from ſubſidies, tolls, and all troubleſome offices. Clarencieux and Norroy king at arms are alſo called *provincial* heralds.

HERALDRY, the art of armoury and blazoning, or the knowledge of what relates to the bearing of arms, and the laws and regulations thereof.

According to its modern acceptation, heraldry is conſidered, not only as the ſcience of armories and their blazons,

but

but as comprehending the knowledge of every thing that relates to the ſeveral military marks of honour and dignity, regularly compoſed of certain figures and tinctures, borne upon ſhields, enſigns, creſts, ſurcoats, &c. which have been aſſumed by ſovereigns, appropriated to communities and high offices, or, according to the laws of arms, have been either taken, and authoriſed to be retained, or originally granted by potentates or ſuch as they have duly authoriſed for that purpoſe, as hereditary tokens, by which families and perſons of ancient and worthy deſcent are not only illuſtrated, diſtinguiſhed, and differenced among themſelves, but ſeparated and known from the ignoble and common rank of people, who are not entitled to uſe ſuch badges of honour and reſpect. Many advantages obviouſly reſult from the knowledge of theſe gentilitial marks of diſtinction. It ſerves to illuſtrate national and family hiſtory, and it has a tendency to preſerve the obſervance of a due ſubordination among the ſeveral ranks and claſſes of mankind. See HERALD.

Few ſubjects have engaged ſo much attention, and led to ſuch a variety of inveſtigations and opinions, as the origin of armories. The commencement of their uſe has been referred to various eras and countries, not excepting the moſt ancient and the moſt remote. Some have traced them to the antediluvian world, and even to the poſterity of Seth, who are ſaid to have been thus diſtinguiſhed from the children of Cain. Rabbinical writers allege, that the divine command ſignified to the children of Iſrael, in the ſecond year after their entrance into the wilderneſs and mentioned in the book of Numbers (ch. i. 52. ii. 2.), that they ſhould pitch their tents every one by his own ſtandard, with the enſigns of their father's houſe, is a full proof of the uſe of armories among the Egyptians, at the time of the departure of the Iſraelites; and they even pretend that their antiquity is aſcertained by the 49th chapter of Geneſis, where notice is taken of the patriarch Jacob's bleſſing his children, and alſo by the breaſt-plate of the high prieſt, which was garniſhed with 12 precious ſtones of different colours. They thus boldly venture to aſcertain the blazon of the reſpective ſtandards and banners uſed by each particular tribe, and which, as they fancy, were aſſigned to them by Jacob. Each Iſraelitiſh family, as they ſay, had its peculiar flag, on which was repreſented ſome certain figure, or device, by which ſuch family was diſtinguiſhed from others of the ſame tribe. Accordingly many fanciful writers have deſcribed the armories of Moſes, Joſhua, Job, Eſther, Judith, David, and other Hebrews of note. Others have pretended that the Pagans of the heroic ages made uſe of armorial bearings; alleging that the Aſſyrians wore, for their arms, a dove argent, in alluſion to the name of their queen Semiramis, and thus ſome commentators explain the expreſſion of Jeremiah, "a facie iræ columbæ." Moreover, the devices on the bucklers of the beſiegers of the city of Thebes, deſcribed by Euripides, and the ſymbols placed on thoſe of the Argonauts, mentioned by Valerius Flaccus, are adduced in confirmation of this opinion. The figures on the ſhields of Agamemnon, and other principal Greeks, who engaged in the ſiege of Troy; the hydra and 100 ſerpents, painted on the ſhield of Aventinus, called by Virgil his paternal enſign, and a paſſage in Pliny (Nat. Hiſt. l. xxxv. c. 3.), where he ſays, "Scutis qualibus apud Trojam pugnatum eſt continebantur imagines," have been thought by ſome writers a ſufficient warrant for aſcribing the invention of armories to the Greeks, previouſly to their expedition againſt the Trojans. The account given by Xenophon, in his "Expedition of Cyrus," and by Philoſtratus, in his "Eulogium on Themiſtocles," of a golden eagle borne on a buckler, being the royal enſign of the Medes; the aſſurances of the Scholiaſt on Ariſtophanes, that it was cuſtomary for thoſe people to paint and repreſent eagles on their ſhields; and the frequent mention, made by the Greek writers, of the devices uſed by Arſaces, Cyrus, Cambyſes, Darius, Xerxes, &c. have induced many to conclude, that armories were originally uſed by the Medes and Perſians, at the time of the eſtabliſhment of their monarchy. The inſtitution of heralds has been referred by ſome perſons to Alexander the Great, who, as they ſay, not only regulated the uſe of armories and their blazons, but granted peculiar arms to many of his principal officers, as tokens of his favour and recompences of their valour. (See HERALD.) The "Jus imaginum" of the Romans has been conſidered by ſome perſons as intended for the ſame purpoſe with the uſe of armories in later times. (See ARMS, in *Heraldry*.) Others attribute the origin of armories to the Spaniards, during their wars with the Moors, in the reign of Julian the Apoſtate; others again refer their origin to the reign of the emperor Theodoſius. Our Engliſh king Arthur, the Saxons, Danes, and other northern nations, have likewiſe been honoured with being the inventors of armory. The emperor Charlemagne is ſuppoſed, by the writers of his life, to be the great regulator of armories, which, as they pretend, were not only known, but generally uſed, in his time. Some, with greater probability, trace their invention to the Germans in the 10th century, and ſuppoſe that they were coeval with tilts and tournaments. But the cruſades or expeditions to the Holy Land have more generally, and perhaps more juſtly, been ſuppoſed to have given riſe to the uſe of armories. Some again aſcribe the introduction of them to the emperor Frederic Barbaroſſa; and others attribute their origin to the powerful factions of the Guelphs and Gibelins, who diſtinguiſhed their reſpective partizans by ſuch devices. Upon the whole we may obſerve, that thoſe writers ſeem to approach neareſt to the truth, who are of opinion, that the primary inſtitution of armories is to be referred to the tournaments held toward the end of the 10th century, their growth to the cruſades, and their perfection to juſts and other feats of arms. For a brief ſketch of the hiſtory of armories, ſee ARMS, in *Heraldry*.

We ſhall cloſe this detail with obſerving in general, that the diverſity of opinion which has prevailed among heraldic writers concerning the origin of arms, and the fooliſh fondneſs which ſome have manifeſted for aſcribing them to a very remote antiquity, have been principally owing to their not diſtinguiſhing between the ſymbols that were uſed as military and national enſigns; the ornaments and figures anciently placed by warriors on their ſhields, helmets, and armour; and thoſe devices, compoſed of different figures and tinctures, which have been aſſigned or authoriſed by ſovereigns to different families, as hereditary tokens and marks of diſtinction, honour, gentility, and nobility, tranſmiſſible from father to ſon, and which are uſually ſtyled coats armour, or coats of arms. See COAT of *Arms*.

Our great Camden, whoſe opinion we have briefly cited under the article ARMS, ſuppoſes, that "ſhortly after the conqueſt, the eſtimation of arms began in the expeditions to the Holy Land, and afterwards, by little and little, became hereditary, when it was accounted an eſpecial honour to poſterity to retain thoſe arms which had been diſplayed in the Holy Land in that holy ſervice againſt the profeſſed enemies of Chriſtianity; and that we received, at that time, the hereditary uſe of them; but that the ſame was not fully eſtabliſhed until the reign of king Henry III.; for that, in the inſtances of the laſt earls of Cheſter, the two Quincies, earls of Wincheſter, and the two Lacies, earls of Lincoln,

Lincoln, the arms of the father ſtill varied from thoſe of the ſon." Sir Henry Spelman is of opinion, that they are of ſtill more modern growth in this kingdom; for, ſpeaking of the antiquity generally allowed to the uſage of arms in England, he obſerves, that "this nation being for ſome hundreds of years harraſſed with wars, in the ſtorm of foreign aſſaults, and civil commotions, there is little reaſon to be over-confident in matters of pedigree and arms beyond 400 years;" and he even expreſſes his doubt, whether they are entitled to that antiquity, by adding; "Neſcio an ea prorſus antiquitate."

Blazon, or the art of blazoning of arms, is a ſubject of importance in the ſcience of heraldry, and it conſiſts in the knowledge of thoſe colours and metals which are proper to be uſed, and of the ſeveral parts, lines of partition, ordinaries, and charges, of which the coat is compoſed. The colours and metals, for an account of which ſee COLOUR in *Heraldry*, are commonly blazoned by tinctures; and, according to the ſentiments of ſome refiners in the art, the arms of gentlemen, eſquires, knights, and baronets, are to be blazoned by tinctures, thoſe of nobles by precious ſtones, and thoſe of ſovereign princes, kings, and emperors, by planets. The two metals, or and argent, and the four colours, yellow, white, black, and red, are the ſeveral tinctures of which the fields, and all charges of arms, ought in ſtrictneſs to be made, excepting, however, ſuch charges as are to be borne in their own proper, or natural colour; which bearings, not having in blazon, any particular, technical, or fixed terms, are all comprehended under the word "Proper." As to all the tinctures, *purpure*, *tenny*, and *ſanguine*, they being mixtures, are now ſeldom, if ever, uſed, either for fields, or charges, although they are ranked amongſt thoſe, to which ſome whimſical heralds have given myſtical ſignifications, and repreſenting the *moral*, *political*, and *military* virtues of thoſe who originally bore their arms ſo coloured or tinctured. *White*, they ſay, denotes chaſtity; *black*, conſtancy; *blue*, loyalty, &c. but the mere mention of theſe ridiculous fancies is ſufficient.

In blazoning a coat of arms, you are to begin with the field, then proceed to the ordinary, and next to the charges. If the coat conſiſts of two colours only, as *e. g.* the coat of Hatton, you may ſay "azure, a cheveron between three garbs or," which implies, that both the cheveron and garbs are or. When you have mentioned the charges that are next to the field, then proceed to thoſe charges that are more remote. When a field is divided by lines, they muſt always be mentioned before the colours.

It is an eſtabliſhed rule among the heralds, that in blazoning, animals are always to be interpreted in the beſt ſenſe; that is, according to their moſt noble and generous qualities, and ſo as may redound moſt to the honour of the bearers.

Thus the fox, being reputed witty, and withal given to filching for his prey; if this be the charge of an eſcutcheon, we are to conceive the quality repreſented to be his wit and cunning, not his theft.

Guillim adds, that all ſavage beaſts are to be figured in their fierceſt action; as, a lion erected, his mouth wide open, his claws extended, &c.: thus formed, he is ſaid to be *rampant*; and if full-faced, *rampant-gardant*. When lions are looking behind them, then the word *regardant* is added to that which ſpeaks their attitude, as *rampant-regardant*, &c.: when lions are repreſented feeding, they are called *rapin*; and in the attitude of ſpringing, with their hind legs cloſe, they are termed *ſaliant*, and ſo of all other beaſts, except griffins, which are termed *ſegreant*, and not *rampant*. A leopard or wolf is to be pourtrayed going, as it were, pedetentim; which form of action, ſaith Chaſſanæus, ſits their natural diſpoſition, and is termed *paſſant*. The gentler kinds are to be ſet forth in their nobleſt and moſt advantageous action; as, a horſe running or vaulting, a greyhound courſing, a deer tripping, a lamb going with ſmooth and eaſy pace, &c.

Every animal is to be moving or looking to the right ſide of the ſhield; and it is a general rule, that the right foot be placed foremoſt, becauſe the right ſide is reckoned the beginning of motion: add, that the upper part is nobler than the lower; ſo that things conſtrained either to look up or down, ought rather to be deſigned looking upwards. It muſt be noted, that notwithſtanding theſe ſolemn precepts of Guillim, and the other maſters of armoury, we find by experience, that there are lions paſſant, couchant, and dormant, as well as rampant, and that moſt animals in arms look down, and not up. The tongues and claws of all beaſts are in heraldry generally repreſented as of a different colour from that of their bodies, and are termed *langued* and *armed*, and, therefore, theſe words ſhould be always mentioned in blazon. It is a rule, that when any beaſt is coloured azure, the tongue and claws muſt be gules; and *vice verſâ*, unleſs it is otherwiſe expreſſed in the grant of arms. When any beaſt proceeds from the bottom of a chief, feſs, &c. they are termed *iſſuant*, and when it proceeds from the feſs or ordinary, it is termed *naiſſant*.

Birds are eſteemed a more honourable bearing than fiſh; and wild and ravenous birds than tame ones.

Birds, according to Leigh, are to be numbered as far as ten; according to Chaſſanæus, to ſixteen; after which they are to be blazoned without number.

Birds painted of their natural colour in arms are termed *proper*, and their claws or talons, and beaks, are called *arms*. If falcons or eagles are drawn feeding, they are then termed *preying*; when the wings of the eagle, falcon, &c. are both behind the head, and back to back, they are termed *expanded*, or *adoſſed*; and when the wings are on each ſide of the head, they are termed *elevated*. An eagle with wings elevated, and legs extended, is called *diſplayed*. When birds are looking behind them, they, as well as beaſts, are called *regardant*.

All birds, except birds of prey, having their beaks and legs of a colour different from that of their body, are termed *membered*, and as to their claws and talons, *armed*. Birds on wing are ſaid to be *volant*.

In the blazoning of fowls much exerciſed in flight, if the wings be not diſplayed, they are ſaid to be borne *cloſe*; *e. gr.* he beareth an eagle, a hawk, or a ſwallow, *cloſe*. In the general, wherever a bird is found in any action or poſture, to which nature does not ordinarily incline it, ſuch action or poſture is to be named, otherwiſe not.

Fiſh are of themſelves of leſs eſteem in a coat armour than beaſts and fowls, as being poſterior to them in the order of creation; but they ſometimes become ſo dignified by the perſons or families who bear them, as to be preferable to many birds or beaſts.

Fiſh are borne different ways; upright, embowed, extended, indorſed, ſurmounted of each other, fretted, trangled, &c.

All fiſh borne feeding ſhould be termed *devouring*.

Fiſh, when placed in a horizontal direction, as if they were ſwimming, are ſaid to be *naiant*; and when they are placed perpendicular, ſo that the head is in chief, and the tail in baſe, they are ſaid to be *hauriant*, that is, drawing or ſucking in air.

Heraldry likewiſe comprehends what relates to the marſhalling of ſolemn cavalcades, proceſſions, and other ceremonies at coronations, inſtalments, creations of peers, funerals, nuptials, &c.

HERAPOUR, in *Geography*, a town of Hindooſtan, in Baglana; 37 miles N.E. of Chandore.

HERAT, a city of Perſia, and formerly the capital of Choraſan, till the firſt Sefi of Perſia transferred this rank to the northern city of Meſhid, is ſeated on a river of the ſame name, which runs into the Caſpian ſea, near Zaweh. It is ſurrounded with walls and ditches, and defended by an old caſtle. Although it is a ſmaller city than Candahar, it maintains a reſpectable trade, and the market place occupying a whole ſtreet, covered with an arched roof, is fitted with ſhops of various wares. Bread, rice, and freſh meat, with various fruits and vegetables, are cheap and abundant. Coarſe woollens are manufactured in the adjacent diſtricts; a great quantity of which, made into garments, is exported to various parts of Northern Perſia. Surtouts of ſheep-ſkins, with the wool on the inſide, are ſeen hanging at almoſt every ſhop, and are uſed by all claſſes of people in the winter ſeaſon. A ſmall quantity of European commodities is brought to this city from the gulf of Perſia, conſiſting of French broad cloths, cutlery, ſmall looking-glaſſes, and prints; but the demand for them is very limited, and, of courſe, their price low. The police of Herat is judiciouſly regulated, and the adminiſtration of juſtice vigorous. The roſes in its vicinity are ſo plentiful, that it has obtained the name of "Sargultzar," or the city of roſes. N. lat. 34° 34'. E. long. 60° 50'.

HERAULD, Didier, in *Biography*, an advocate in the parliament at Paris, who flouriſhed in the beginning of the ſeventeenth century, and died in the year 1649, publiſhed ſeveral works which have been highly eſteemed. Of theſe the principal are "Notes upon Tertullian's Apologetic, Minutius Felix, Arnobius, and Martial;" "Adverſaria," and various works on legal ſubjects. He diſguiſed himſelf under the name of David Leidhreſſerus, to write a political diſſertation upon the independence of kings, ſome time after the death of Henry IV. Salmaſius and Herauld were antagoniſts. The latter was writing a work in vindication of himſelf when he died, and was ſuppoſed to be about ſeventy years of age. He had the reputation of being a very learned man, and wrote very pleaſantly upon whatever ſubjects he pleaſed. Bayle.

HERAULT, in *Geography*, one of the nine departments of the ſouthern region of France; being a portion of Lower Languedoc, in 43° 50' N. lat. S. of Lozere, containing 317 ſquare leagues, and 291,957 inhabitants; divided into four diſtricts, *viz.* Lodeve, with 48,280 inhabitants; Montpellier, with 100,815; Beziers, with 106,176; and St. Pons, with 36,686 inhabitants. Its cantons are 36, and its communes 333. The contributions for land-tax, &c. are 4,060,543 francs, and its expences for adminiſtration, juſtice, and public inſtruction are 334,317 fr. 33 cents. It is bounded on the N. by the departments of the Tarn and Aveiron, on the N.E. by that of the Gard, on the S.E. by the Mediterranean, on the S.W. by the department of the Aude, and on the W. by that of the Tarn. It takes its name from a river which traverſes it from N. to S. nearly in the centre, and diſcharges itſelf into the Mediterranean a little below Agde. Its capital is Montpellier. This department conſiſts of hills, vallies, and plains of various ſoil, yielding little grain but abundance of good fruit, good wine, and paſtures. It has conſiderable foreſts of oak, mines of lead, coal, quarries of marble, and mineral ſprings.

HERAY, a town of Africa, in the country of the Foulahs; 40 miles E.N.E. of Tor.

HERB, in *Botany*. See Herba.

The word is formed of the Latin *herba*, which ſome derive from *arvum*, *field*; others from the Greek φερβω, *paſcere*, *to feed*, of φερβη, *pabulum*. Of the Greek *pherbe*, the Latins formed *pherba*; and of *ferba*, *herba*, after the manner of the Spaniards, who always change the *f* at the beginning of a word into *h*.

Herb, in *Gardening*, that ſort of plant which riſes with leaves and ſtalks annually from the root, the ſtalks not becoming woody or durable in their growth.

Many of the kitchen-garden eſculents, and a great variety of ornamental or flowery plants, are of this kind. (See Herbaceous *Plants*.) And, likewiſe, many under-ſhrubby eſculent and other plants are conſidered ſometimes as herbs; ſuch as ſage, thyme, rue, hyſſop, winter-ſavory, lavender, &c.; but theſe having ligneous, durable ſtalks and branches, more properly belong to the ſhrubby tribe of plants.

Herbs are diſtinguiſhed into *kitchen* or *ſallet*-herbs, and *medicinal* herbs.

Herbs, *Sallet*. See Sallet.

Herbs, *Medicinal*. See Simple.

Herb-*bane*, in *Botany*. See Orobanche.

Herb-*bane*, *great purple*. See Lathræa.

Herb, *St. Bartholomew's*. See Ilex.

Herb, *Bennet*, *herb bleſſed*, or *avens*. See Geum.

Herb *Chriſtopher*. See Actæa.

Herb *Gerard*. See Ægopodium.

Herb *of Grace*, a name by which ſome call rue. See Ruta.

Herb *Maſtich*. See Satureia.

Herb *Maſtich*, *Syrian*. See Teucrium and Germander.

Herb *Paris*. See Paris.

Herb *Paris of Canada*. See Trillium.

Herb *Robert*, a name ſometimes uſed for the *geranium*, which ſee.

Herb *Trefoil*. See Trefoil.

Herb *Trinity*, a name ſometimes given to the violet. See Viola.

Herb *True-love*, the name by which the herb paris is ſometimes called.

Herb *Two-pence*. See Lysimachia.

Herb *Willow*, or *Willow-Herb*. See Epilobium, Lythrum, and Lysimachia.

HERBA, the *herb*, in *Botanical* phraſeology, includes every part of a plant, except the root and fructification, whether it be of an herbaceous, ſhrubby, or arborſcent kind. In this the habit, or general aſpect of a vegetable, is principally diſcerned. Under it the eſſential nature or characters are veiled or maſked, as it were, till they diſplay themſelves naked and explicitly in the flower and fruit. By the latter parts only are plants ſafely to be defined generically, or claſſed ſyſtematically, while the *herb*, for the moſt part, affords ſufficient and very convenient ſpecific diſtinctions. The colour remarkably appropriated to the *herb* is green, inſomuch that it is only when tinged with any other hue, or when white, that it is technically ſaid to be *coloured*. The parts belonging excluſively to the *herb*, are the ſtem, all kinds of general or partial ſtalks, the leaves, ſtipules, tendrils, and even bracteas; though the latter only attend the inflorescence, but they make no part of the fructification.

Herba *Roſſa*, a name given by Latin writers to a plant uſed by the dyers in making their yellow colours, and by the women in tinging their hair yellow, which was the favourite colour of ancient times. It is alſo by ſome called *rubia herba*. It was from this ſimilitude with the word *rubia*, which ſignifies madder, a vegetable uſed alſo in the dyeing trade, ſuppoſed to be the ſame plant; but all the accounts we have of the rubia, or *roſſa herba*, ſhew it to be different in all reſpects from the madder. Paulus

Ægineta, who calls it *robia herba*, takes pains to diſtinguiſh it from the rubia, and ſhews that it was the plant called œcomenium and cymene by the Greeks, and lutum, lutea herba, and corniola by the Latins. It is the geniſta tinctoria, or dyer's weed, at this time common both in England and Greece, and uſed in both places in dyeing yellow. Pliny tells us, that the lutum had the leaves of flax, and the flowers of broom; this ſufficiently ſhews that it was the plant we have mentioned.

HERBA *Scythica*, a name by which ſome authors have called the common liquorice, the root and inſpiſſated juice of which are uſed in the ſhops.

HERBA *Vulcani*, a name uſed by ſome writers for the ranunculus.

HERBA, in *Geography*, a town of Africa, in the deſert of Sahara; 50 miles S. E. of Gurdeia.—Alſo, a town of Algiers; 40 miles S. S. W. of Algiers.

HERBA, *El*, a town of the weſtern province of Algiers, or Tlemſan, or Tremecen, ſituated on the river Shelliff, with a narrow ſtrip of fertile ground behind it. Here are ſeveral ruins of pillars, with the capitals, probably of the Corinthian order, defaced, and ſeveral coffins, on ſome of which are inſcriptions, with hollows on the upper ſurface, as if they were intended to receive a libation.

HERBACEOUS PLANTS, in *Vegetable Phyſiology*, are thoſe whoſe herb (ſee HERBA) is but of annual duration, whether the root be annual, biennial, or perennial. The term is erroneouſly reſtricted in Willdenow's Principles of Botany, Engliſh edition, 131, to plants which "bear flowers and ſeeds but once and then die."

Herbaceous plants are very diſtinguiſhable from the woody kinds, ſuch as trees, ſhrubs, and under-ſhrubs, whoſe ſtems and branches are woody or ligneous, and durable in a greater or leſs degree. Indeed, to this claſs properly belong a great number of the garden eſculent vegetables, a great many of the flowery tribe deſtined for the pleaſure ground, and nearly the whole of the annual and biennial ſorts, as well as the perennial kinds, whether of the fibrous, tuberous, or bulbous-rooted deſcriptions, the ſtalks of which annually decline.

HERBACEOUS *Plants, Foſſil.* Mr. Kirwan remarks, (Geological Eſſays, p. 318.) that the foſſil plants found in the carboniferous ſtrata, or coal-meaſures, are thoſe of herbaceous plants, as ferns, &c. which, of all others, contain the leaſt oil in their compoſition; and that the reſiniferous tribe are rarely met with in thoſe ſtrata. M. Blumenbach, as is obſerved, p. 332, conſiders all the herbs met with in the vicinity of coal to be of unknown ſpecies. See our articles COALS and COLLIERIES.

HERBAGE, a collective name, comprehending all kinds of herbs.

What makes the principal difference in the goodneſs of butters and cheeſes, is the difference of herbage.

HERBAGE, in *Law*, ſignifies the green paſture or fruits of the earth, provided by nature for the food of cattle.

HERBAGE is alſo uſed for a liberty which a man hath to feed his cattle in another man's ground; as, in the foreſt.

HERBAGE, in *Rural Economy*, a term very generally applied to ſuch graſs lands as are moſtly kept in the ſtate of paſture. It is alſo occaſionally employed to ſignify the tithe and right of paſture. See GRASS.

HERBAIN, LE CHEVALIER, in *Biography*, capitaine d'infanterie in the ſervice of France, and chevalier de St. Louis, compoſed an opera in Italy, entitled "Æneas and Lavinia," at Paris, 1756; "Celime," in one act, for the theatre Ital. in 1763; 'Les deux Talens," in 1764; "Nanette and Lucas," written by M. Framery.

HERBAL, a book which treats of plants, or deſcribes the figure, genus, ſpecies, properties, virtues, &c. of herbs, trees, ſeeds, plants, &c.

Such are Gerard's Herbal, Parkinſon's Herbal, &c.

HERBAL is alſo uſed for a ſet or collection of ſpecimens of the ſeveral kinds of plants, dried and preſerved in the leaves of a book, called alſo a Hortus Siccus.

In the Philoſophical Tranſactions, we have a method deſcribed for preſerving ſpecimens for ſuch a herbal. The flowers, leaves, &c. gathered perfectly ripe, and in their true colours, are to be ſpread on whity-brown paper, with the parts all diſplayed as diſtinctly as may be. If the ſtem, or body of the flower, &c. be thick, one-half is to be pared away to make it lie flat. Over theſe is to be ſpread another paper; and the whole is to be put between two iron plates, ſcrewed tight together, and thus baked in an oven for two hours. When taken out, waſh the plants over with a mixture of brandy and aqua fortis, and lay them on freſh paper to dry. Laſtly, lick over the back ſides with a bruſh dipped in a diſſolution of gum tragacanth, to make them ſtick; and lay them in the paper book, where they will lie faſt, and always look freſh.

HERBALIST, or HERBORIST, a perſon ſkilful in plants; the ſame with *botaniſt*.

To *herbalize*, or *herbarize*, is to go into the fields in ſearch of different or new herbs or plants.

HERBARIUM, in *Botany*, was originally uſed as the title of botanical works, and tranſlated by the Engliſh word *herbal*. It is now more generally applied to deſignate a collection of dried plants, or *hortus ſiccus*, kept for botanical uſe, to ſupply, as far as poſſible, the want of free acceſs at all times to the whole vegetable world in full perfection. The term is, therefore, applicable to any collection of preſerved plants fit for ſuch uſe, whether dried in any form, kept in ſpirits, or otherwiſe. An herbarium is neceſſary, as Linnæus obſerves, to every botaniſt. How finely ſoever a plant may be repreſented in a drawing or plate, we can ſee nothing but what the artiſt ſaw, and with his eyes. We can examine or enquire no further. But when we have the natural object actually before us, we can judge and inveſtigate for ourſelves; we can reſtore the dried plant, by immerſion, in boiling water, ſo that all but its colours becomes preſent before us. Some of the moſt learned botaniſts have been cenſured for truſting to dried ſpecimens; and if they do ſo when they might have acceſs to living ones, they are juſtly cenſurable. But thoſe who are converſant with ſuch objects, acquire a wonderful facility in judging of them, and the mind becomes perfectly able to conceive their living appearance, be their colours more or leſs preſerved.

The general way of making an herbarium is by drying ſpecimens of plants between paper. Theſe ſhould be choſen as perfect as poſſible, ſhowing the ordinary ſtate and aſpect of the ſpecies, and when laid out to dry, ſhould not be formally or artificially expanded, ſo as to deſtroy their characteriſtic habit, but merely ſo as to prevent unnatural folds or confuſion of parts. The flower may conveniently be diſplayed by itſelf, ſo that its internal parts may come under inſpection, and the progreſs of the germen towards maturity, as well as the ripe ſeed or fruit ſhould, if poſſible, be ſeen in the ſpecimen. When dry, plants are either laid looſe between papers, on which their names and the place where each ſpecimen grew ſhould be marked; or they are faſtened to the paper, which we much recommend, with weak carpenters' glue. They are preſerved from the attacks of inſects, and their colours much revived, by being touched with a hair-pencil, dipped in a weak ſolution of corroſive

corroſive ſublimate of mercury in ſpirits of wine, to which a little camphor may be added.

If plants are very ſucculent, their life muſt be deſtroyed before we attempt to dry them, by immerſion in boiling water, or by heating them thoroughly with a hot iron. The former method is adviſable for ſuch as are prone to throw off their leaves between papers, as Heaths and Firs.

Specimens of plants are commodiouſly preſerved in lockers, or on the ſhelves of a cabinet in a very dry room, but they are beſt without a conſtant fire, the heat of which renders them brittle; and the ſmoke of a coal fire ſoon ſpoils any collection to which it has acceſs. Heat alſo promotes the propagation of inſects, which are very pernicious, unleſs the collection be poiſoned as above recommended.

The herbarium of a working or publiſhing botaniſt acquires peculiar and ineſtimable value, as being the repoſitory of his authorities, the teſt of his accuracy, and the corrector of his overſights and miſtakes. Hence, the uſe of the Linnæan and Dillenian herbariums, the vaſt collections at Oxford, London, Paris, and elſewhere, accumulated by the various contributions of ſpecimens, with the authentic names or remarks of original authors or collectors. Theſe require often to be conſulted, and no garden or library can ſupply their place.

HERBAULT, in *Geography*, a town of France, in the department of the Loir and Cher, and chief place of a canton, in the diſtrict of Blois; 8 miles W. of Blois. The place contains 706, and the canton 10,544 inhabitants, on a territory of 387½ kiliometres, in 21 communes.

HERBE, in the *French Academies*, a reward, or ſome good ſtuff given to a horſe that has worked well in the manege.

Herbe, in *Geography*, a town of Italy, in the Veroneſe; 15 miles S. of Verona.

HERBELOT, Bartholomew *D'*, in *Biography*, celebrated for his Oriental knowledge, was born at Paris in 1625. After paſſing through a courſe of general ſtudy, he made the Hebrew language his great purſuit, in order that he might the better come to the right underſtanding of the Old Teſtament. He went to Italy that he might have an opportunity of converſing with ſome Orientaliſts who frequented the ports of that country in the way of buſineſs. At Rome he contracted an intimacy with Holſtenius and Leo Allatius, two of the moſt learned men of the age. He obtained the poſt of ſecretary, and interpreter of the Oriental languages at Paris. This was after his return from a ſecond journey to Italy; and upon another viſit to that country, his reputation acquired him the notice of many perſons of eminence, particularly of Ferdinand II., grand-duke of Tuſcany, who purchaſed for him a valuable collection of Eaſtern manuſcripts. It was in this country that he made a commencement of his "Bibliothêque Orientale," and upon being recalled to Paris by the celebrated Colbert, a penſion was ſettled on him, to enable him to continue his labours. He originally intended to have printed his work with the Arabic characters, and types were caſt for the purpoſe; but upon the death of his patron, Colbert, the deſign was changed for that of a work in French. He was now nominated to the royal profeſſorſhip of the Syriac language, in which poſt he continued till his death, which took place in 1695, at the age of ſeventy. D'Herbelot was a man of very general erudition, and of high eſtimation as a private character, free from oſtentation and pride; upright, pious, and charitable. His great work, firſt publiſhed in Paris 1697, and ſince re-printed in Holland, is a vaſt collection of every thing relative to the hiſtory, biography, manners, and cuſtoms of the Eaſtern nations. According to Mr. Gibbon, "this work is an agreeable miſcellany, which muſt gratify every taſte;" but he adds, "I can never digeſt the alphabetical order; and I find him more ſatisfactory in the Perſian than the Arabic hiſtory. The recent ſupplement from the papers of M. M. Viſdelore and Galland is of a different caſt, a medley of tales, proverbs, and Chineſe antiquities." Moreri. Gibbon.

HERBEMONT, in *Geography*, a town of France, in the department of the Foreſts, ſituated on a mountain, near the Semoy; 20 miles W. of Arlon.

HERBENGER, or Harbinger. See Harbinger.

HERBER, in the *Manege*, is uſed by farriers to denote an application for ſome diſeaſes in horſes, particularly of the head and the anticor. It conſiſts only of a piece of hellebore-root, which, being put into the middle of the horſe's counter, makes it ſwell and ſuppurate.

HERBERT, Mary, in *Biography*, counteſs of Pembroke, was the ſiſter of ſir Philip Sidney. She tranſlated from the French a tragedy entitled Annius, 1595, and rendered into Engliſh ſome of David's Pſalms. She died in 1621. The following well known epitaph was written for her by the celebrated Ben Jonſon:

"Underneath this ſable hearſe
Lies the ſubject of all verſe,
Sidney's ſiſter, Pembroke's mother:
Death! ere thou haſt killed another,
Fair, and good, and learn'd as ſhe,
Time ſhall throw a dart on thee."

Herbert, William, earl of Pembroke, was born at Wilton in 1580, and educated at New College, Oxford. In 1601 he ſucceeded to the family honours and eſtates; and in 1626 he was elected chancellor of Oxford, and ſteward of the king's houſehold. He died in the year 1630, and his poems were printed in 1660.

Herbert, Thomas, of the ſame family, educated partly at Jeſus College, and partly at Trinity College Cambridge, publiſhed, in 1634, his "Travels into Africa and Aſia." During the rebellion, he at firſt joined the parliament party, and afterwards ſerved with great fidelity in the royal cauſe, and was created a baronet at the reſtoration. He died in 1682. He wrote an hiſtorical account of the two laſt years of the life of Charles I.—Biog. Brit.

Herbert of Cherbury, Edward, *Lord*, was born at the caſtle of Montgomery in 1581, and attained ſo early the rudiments of learning, that at the age of twelve he was ſent to the univerſity of Oxford. In the year 1600 he came to London, and ſhortly after the acceſſion of James I. was created knight of the Bath. He ſerved the office of high ſheriff for the county of Montgomery, and divided his time between the country and the court. In 1608, feeling wearied with the ſameneſs of domeſtic ſcenes, he left England for a viſit to the continent, carrying with him thoſe chivalrous ideas with which his knigthood of the Bath, by its whimſical oath and ceremonial, ſeems to have impreſſed him; and that nicety in the point of honour, which, in ſuch an age, was likely to involve him in perpetual quarrels. His advantageous perſon and manners, and the reputation for courage which he acquired, gained him many friends, among whom was the conſtable Montmorenci. At a feat of this nobleman he paſſed ſeveral months practiſing horſemanſhip, and other manly exerciſes, in which he became ſingularly expert. He returned to England in 1609, and in the following year he quitted it again, in order that he might have the opportunity of ſerving with the Engliſh forces, ſent to aſſiſt the prince of Orange at the ſiege of Juliers. Here he ſignaliſed himſelf

ſelf by his valour, which, in ſome inſtances, was carried to the extreme of raſhneſs. After the ſiege he viſited Antwerp and Bruſſels, and returned to London, where he was looked now upon as one of the moſt conſpicuous characters of the time. An attempt was made to aſſaſſinate him in revenge for ſome liberties which he took, or was ſuppoſed to take, with a married lady. In 1614 he went into the Low Countries to ſerve under the prince of Orange; after this he engaged with the duke of Savoy, to conduct from France a body of Proteſtants to Piedmont for his ſervice. In 1616 he was ſent ambaſſador to the court of France, in which office he diſplayed much ſagacity and zeal in all the buſineſs entruſted to him. On one occaſion, however, he had a quarrel with the French miniſter, which cauſed his recal: though the office was devolved on him again at a future period. It was at Paris, in 1624, that he printed his famous book, "De Veritate prout diſtinguitur à Revelatione," which he had planned and begun in England. Previouſly to the publication of this work, he ſays, that he ſought the direction and guidance of heaven, as to the courſe he ſhould take; "I took," ſays he, "my book, De Veritate, in my hands, and kneeling on my knees, devoutly ſaid theſe words, O thou eternal God, Author of the light that now ſhines on me, and giver of all inward illuminations, I do beſeech thee, of thy infinite goodneſs, to pardon a greater requeſt than I a ſinner ought to make: I am not ſatisfied enough, whether I ſhall publiſh this book "De Veritate;" if it be for thy glory, I beſeech thee give me ſome ſign from heaven; if not, I ſhall ſuppreſs it.—I had no ſooner ſpoken theſe words, but a loud, though yet a gentle noiſe came from heaven (for it was like nothing on earth), which did ſo comfort and cheer me, that I took my petition as granted, and that I had the ſign demanded." However he might have been deluded by an enthuſiaſtic imagination, there is no reaſon to think that he did not believe the fact himſelf. In 1625 he was created an Iriſh peer, on account of his ſervices in promoting a match between the prince of Wales and the princeſs Henrietta of France; and ſhortly an Engliſh baron, under the title of lord Herbert of Cherbury in Shropſhire. From this time we hear no more of him in public life, but at the breaking out of the civil wars he adhered to the parliamentary cauſe. He died in London in 1648, and was buried in the church of St. Giles-in-the-fields. His own memoirs exhibit him as vain, boaſtful, fanciful, but open, generous, brave, and diſintereſted. He ſtood in high eſtimation among his contemporaries as a man and an author. The object of his great work "De Veritate," is to aſſert the ſufficiency, univerſality, and abſolute perfection of natural religion, with a view of proving the uſeleſſneſs of revelation. It has been frequently re-printed, and as often anſwered by learned Chriſtians. This piece was followed by a piece, entitled "De Religione Gentilium errorumque apud eos Cauſis." His other principal work was "The Hiſtory of the Life and Reign of Henry VIII.," which, in point of compoſition, was eſteemed one of the beſt hiſtorical works in the language, but it is written with much partiality for the tyrannical king: the Engliſh ſtyle of lord Herbert is ſtrong, manly, and free from the quaintneſs and pedantry of the age. His poems were publiſhed in 1665, by Nicholas Ferrar, and his memoirs of himſelf, in 1764, by Mr. Walpole. Biog. Brit.

Herbert, George, brother of the preceding, was born in 1593. He was educated at Weſtminſter ſchool, from which place he went to Trinity college, Cambridge, where he purſued his ſtudies with great diligence, took his degrees, and in 1619 was choſen orator of the univerſity. In this character he ſeems to have uſed the moſt abſurd flattery towards king James I., whom he made indefinitely greater, as an orator and writer, than the ſages of Greece and Rome. It may be ſaid in his excuſe, that he was looking for court promotion, which could not be expected by any who did not praiſe the monarch for qualities which all the world knew he never poſſeſſed. He was not altogether unſucceſsful, but obtained from James a ſinecure of 120*l. per annum.* On the death of the monarch, Mr. Herbert reſolved to enter upon holy orders, and from this period the ardour of his mind was entirely turned upon an exemplary diſcharge of the miniſterial functions. In 1626 he was preſented to the prebend of Layton Eccleſia, in the dioceſe of Lincoln. His firſt work was to rebuild, partly at his own coſt, and partly by means of contributions, the decayed church of the place. In 1630 he took prieſt's orders, and was inducted to the rectory of Bemerton, near Saliſbury. He now ſeems to have had no other ambition than that of becoming an humble pariſh prieſt, than which a more uſeful and honourable character no man can ſuſtain. For his own uſe, and that of his brethren, he drew up a brief manual, entitled "The Country Parſon," containing rules for the conduct of a perſon in that ſituation, which are much praiſed for their excellent tendency. His own behaviour was a perpetual comment upon theſe rules. He died of a decline in 1633, and after his death a poſthumous work was publiſhed, entitled "The Temple: ſacred Poems and private Ejaculations." Theſe poems were much read and admired by the lovers of ſacred poetry. His character has been given by his brother lord Herbert in the following ſentence: "His life was holy and exemplary, inſomuch that about Saliſbury, where he lived beneficed, he was little leſs than ſainted."

HERBESTIEN, Sigismond, *Baron*, born at Vippach, in Stiria, in 1486, entered into the imperial ſervice in 1506, and diſtinguiſhed himſelf againſt the Turks. In 1509 he was made commandant of all the Stirian cavalry, and was afterwards rewarded with the title of knight, and the dignity of court counſellor. He was employed in various embaſſies, to Denmark, Poland, and Ruſſia, and was created a privy counſellor, and preſident of the Auſtrian chamber. In 1541 he went out as ambaſſador to the grand Seignior, who was at that time with his army near Buda. He had various other honourable employments entruſted to his management, and, after having ſerved four emperors moſt faithfully, retired from public life. He died in 1566. As an author, he is known by a hiſtory of Muſcovy, which appeared at Baſil in 1561, under the title of "Commentarii Rerum Moſcovitarum." He was author alſo of a hiſtory of his own life, and of the origin of his family. Moreri.

HERBIDÆ Vestes, green habits. See Earinæ *veſtes.*

HERBIERS, Les, in *Geography*, a town of France, in the department of the Vendée, and chief place of a canton, in the diſtrict of Montaigu; 13 miles S.E. of Montaigu. The place contains 1910, and the canton 6616 inhabitants, on a territory of 195 kiliometres, in ſeven communes.

HERBIGNAS, a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Saveney; 9 miles N.E. of Guerande. The place contains 2016, and the canton 5831 inhabitants, on a territory of 250 kiliometres, in four communes.

HERBINIUS, John, in *Biography*, a native of Bitchen, in Sileſia, who publiſhed ſome treatiſes on Water-Falls; alſo, "De Statu Eccleſiarum Auguſtinæ Confeſſionis in Polonia," 4to. 1670. He died in 1676, aged 44. Moreri.

HERBIVOROUS, an epithet given to thoſe creatures which feed only on vegetables, to diſtinguiſh them from the carnivorous, or ſuch as feed on fleſh.

HERBORN,

HERBORN, in *Geography*, a town of Germany, in the principality of Naſſau Dillenburg, with a caſtle, ſituated on the Dille. The chief manufacture is that of iron; 3 miles S.S.E. of Dillenburg. N. lat. 50° 34′. E. long. 26.

HERBOSUM MARMOR, the name of a ſpecies of marble, much eſteemed and uſed by the ancient architects and ſtatuaries. It was of a beautiful green colour, but had always with it ſome caſt of yellow. It was dug in the quarries of Taigetum, but was eſteemed by the workmen the ſame in all reſpects; except colour, with the black marble dug at Tænarus in Lacedæmonia, and thence called the Tænarian marble.

HERBSLEBEN, in *Geography*, a town of Germany, in the principality of Gotha; 9 miles N.E. of Gotha.

HERBST, JOHN ANDREAS, in *Biography*, an eminent practical and theoretical German muſician, who flouriſhed in the 17th century, was born at Nuremberg. In the year 1628 he was appointed chapel-maſter at Frankfort on the Maine, and continued in that ſtation till 1641, when he was called to the ſame office at Nuremberg. However, in 1650 he thought fit to return to Frankfort, at the ſolicitation of the magiſtrates and others his friends; and, being by them reinſtated in his former dignity, he continued in that ſtation till the time of his death, in the year 1660. He was excellently ſkilled in the theory of muſic, and in the art of practical compoſition had few equals; and was, beſides, like moſt of the Germans, a ſound and judicious organiſt. In the year 1643 he publiſhed, in the German language, a book entitled "Muſica Poetica;" and, ten years after, a tranſlation either from the Latin or the Italian, for it is extant in both languages, of the "Arte prattica e poetica of Giov. Chiodino," in ten books. Herbſt was alſo the author of a tract entitled "Muſica moderna prattica, overo maniere del buon canto," printed at Frankfort in 1658, in which he recommends the Italian manner of ſinging. His other works are, a ſmall tract on Thorough-baſs, and a diſcourſe on counterpoint, containing directions for compoſing "a mente non a penna." Of his muſical compoſitions, all that are extant in print are, "Meletemata ſacra Davidis," and "Suſpiria S. Gregorii ad Chriſtum," for three voices. Theſe were printed in 1619, as was alſo a nameleſs compoſition by him for ſix voices. Draud. Bibl. Claſſ. p. 1649. and Walther.

HERBSTEIN, in *Geography*, a town of Germany, in the biſhopric of Fulda; 13 miles W. of Fulda.

HERCAJADA, a town of Spain, in the province of Leon; 30 miles W. of Avila.

HERCINIAN, or HERCYNIAN *foreſt*, a foreſt which formerly extended over the face of Germany, commencing at the limits of the Helvetii, Nametes, and Rauvaci, and running along the Danube to the borders of the Daci and Anartes. It is now cut down in many places, and parcelled out into woods which go by particular names; as, the Black foreſt, which ſeparates Alſace from Swabia; the Steyger, in Franconia; the Spiſſard, on the Main; the Thuringer, in Thuringia; Heſerwald, in the duchy of Cleves; the Bohemerwald, which encompaſſes Bohemia, and was in the middle ages called Hercinia ſylva; and the Hartz, in Lunenburgh. See FOREST.

HERCK, a town of France, in the department of the Lower Meuſe, and chief place of a canton, in the diſtrict of Haſſalt. The place contains 878, and the canton 8550 inhabitants, on a territory of 142½ kiliometres, in 13 communes.

HERCULANEUM is the name of an ancient city of Campania, in Italy, near the preſent ſeite of a village called *Portici*, which was deſtroyed, by an eruption of Veſuvius, in the firſt year of the empire of Titus, or the 79th of the Chriſtian era, and lately rendered famous on account of the curious monuments of antiquity diſcovered in its ruins; an account of which has been publiſhed by order of the king of Naples, in a work of ſix volumes folio.

The epocha of the foundation of Herculaneum is unknown. Dionyſius Halicarnaſſenſis conjectures, that it may be referred to ſixty years before the war of Troy, or about 1342 years before Chriſt; and, therefore, that it laſted about 1400 years.

Herculaneum and Pompeii, which latter town was deſtroyed at the ſame time with the former (ſee POMPEII), ſtood once above ground; though at this time the former is in no part leſs than 70 feet, and in ſome parts 112 feet below the preſent ſurface of the earth; and the latter is buried 10 or 12 feet deep, more or leſs. Whatever matter, therefore, lies between theſe cities and the preſent ſurface of the earth over them, muſt have been produced ſince the year 79 of the Chriſtian era, the date of that formidable eruption by which they were deſtroyed. It appears, by the obſervations of ſir William Hamilton (Phil. Tranſ. vol. lxi.), that the matter which covers the ancient town of Herculaneum is not the produce of one eruption only; for there are evident marks that the matter of ſix eruptions has taken its courſe over that which lies immediately above the town, and which was the cauſe of its deſtruction. Theſe ſtrata are either of lava or burnt matter, with veins of good ſoil between them. The ſtratum, ſays this writer, of erupted matter that immediately covers the town, and with which the theatre and moſt of the houſes was filled, is not of that foul vitrified matter called lava, but of a ſort of ſoft ſtone compoſed of pumice, aſhes, and burnt matter. It is exactly of the ſame nature with what is called the Naples ſtone; the Italians diſtinguiſh it by the name of TUFA, which ſee; and it is in general uſe for building. This matter, when it firſt iſſued from Veſuvius, and covered Herculaneum, was, as our author conceives, in the ſtate of liquid mud. In proof of this opinion he obſerves, that he ſaw the head of an antique ſtatue dug out of this matter within the theatre of Herculaneum: the impreſſion of its face remains, he ſays, to this day in the tufa, and might ſerve as a mould for a caſt in plaiſter of Paris, being as perfect as any mould he ever ſaw. This ſoft matter has been the means of preſerving the pictures, MSS., buſts, utenſils, and other antique remains, which have been recovered out of Herculaneum from utter deſtruction. For if any of the ſix ſucceeding eruptions had happened previous to this, and the red-hot liquid lava, of which they conſiſted, had flowed into the open city, it would have filled every ſtreet, ſcorched up every combuſtible ſubſtance with intenſe heat, involving the houſes and all they contained in one ſolid rock of lava, undiſtinguiſhable, and for ever inſeparable from it. The eruption, which buried the city in cinders, earth, and aſhes, has in ſome meaſure preſerved it from the more deſtructive effects of the fiery torrents which have overwhelmed it ſince. When we conſider that the intervals between thoſe eruptions were ſufficiently long to allow a ſoil to be formed upon the hardened lava of earth; that a new city has been actually built on the lava of the laſt eruption; and that the ancient city is from 70 to 100 feet below the preſent ſurface of the earth, we muſt acknowledge it more ſurpriſing that any, than that ſo few of its ornaments have been preſerved. At the beginning of the laſt century any body would have imagined that the buſts, ſtatues, and pictures of Herculaneum had not a much better chance than the perſons they repreſent of appearing again, within a few years upon the ſurface of this globe.

The preciſe ſituation of this ſubterraneous city was not known till the year 1713, when it was accidentally diſcovered by

by ſome labourers, who, in digging a well, ſtruck upon a ſtatue on the benches of the theatre. Many were afterwards dug out, and ſent to France, by the prince of Elbœuf; but little progreſs was made in the excavations till Charles, infant of Spain, aſcended the Neapolitan throne. By his unwearied efforts and liberality, a very conſiderable part of Herculaneum has been explored, and ſuch treaſures of antiquity drawn out, as form the moſt curious muſeum in the world. In order to explore theſe hidden treaſures, the king had galleries cut to the principal buildings, and cauſed the extent of one or two of them to be cleared. Of theſe the theatre is the moſt conſiderable. On a baluſtrade, which divided the orcheſtra from the ſtage, was found a row of ſtatues; and, on each ſide of the pulpitum, the equeſtrian figure of a perſon of the Nonia family. Theſe are now placed under the porticos of the palace; and from the great rarity of equeſtrian ſtatues in marble, ſays Swinburne (Travels in the two Sicilies, vol. iii.), would be very valuable objects, were their workmanſhip even leſs excellent than it is; one of them in particular is a very fine piece of ſculpture. By continued labour and expence, ſince the king of Spain left Naples, the collection of curioſities that has been dug out of the ruins of Herculaneum and Pompeii is already very conſiderable. The muſeum, in which many of them are arranged, forms a wing of the palace; and this muſeum poſſeſſes not only ſtatues, buſts, altars, inſcriptions, and other ornamental appendages of opulence and luxury, but alſo an entire apartment of the domeſtic, muſical, and chirurgical inſtruments uſed by the ancients; tripods of elegant form and exquiſite execution, lamps in endleſs variety, vaſes and baſons of noble dimenſions, chandeliers of the moſt beautiful ſhapes, pateras and other appurtenances of ſacrifice, looking-glaſſes of poliſhed metal, coloured glaſs, ſo hard, clear, and well-ſtained as to appear like emeralds, ſapphires, and other precious ſtones; a kitchen completely filled up with copper-pans lined with ſilver, kettles, ciſterns for heating water, and every uſeful neceſſary for culinary purpoſes; ſpecimens of various ſorts of eatables, retaining their form, though burnt to a cinder; corn, bread, fiſh, oil, wine, and flower; a lady's toilet, furniſhed with combs, thimbles, rings, paint, ear-rings, &c. Among the ſtatues, which are numerous, connoiſſeurs allow the greateſt ſhare of merit to Mercury, and a ſleeping Faun. The fine bronze buſts fill ſeveral rooms, but few of the originals for whom they were intended are now known. The intaglios and cameos hitherto diſcovered have not been much commended. The floors are paved with Moſaic; few rare medals have been found in theſe ruins; the moſt curious is a gold medallion of Auguſtus, ſuppoſed to have been ſtruck in Sicily, where he had been ſaluted emperor 15 times: on its reverſe is a female figure with IMI. XV. SICIL. The freſco paintings executed upon the ſtucco which lined the walls, have been taken off with great labour and addreſs, and are now preſerved in glaſs caſes. The colours, it is ſaid, were much brighter before they were drawn out of their ſubterraneous abode, and expoſed to the open air; they are, however, ſtill wonderfully lively; the ſubjects are underſtood at the firſt glance by thoſe who are acquainted with the Grecian hiſtory and mythology. Here are a Chiron teaching Achilles to play upon the lyre, Ariadne deſerted, the judgment of Paris, ſome Bacchantes and Fauns; the largeſt piece repreſents Theſeus's victory over the Minotaur: it conſiſts of ſeven or eight figures very well grouped; but a frieze, with a dancing woman, on a black ground, not above 10 inches long, is thought the beſt. But we ought not to eſtimate the degree of perfection which the ancients had attained in the art of painting by theſe ſpecimens. It is not probable that the beſt paintings of ancient Greece and Italy were depoſited in Herculaneum or Pompeii, which were towns of the ſecond order, and not likely to poſſeſs the maſter-pieces of the chief artiſts, which were uſually deſtined to adorn the more celebrated temples, or the palaces of kings and emperors. Their beſt ſtatues are correct in their proportions, and elegant in their forms; their paintings are not correct in their proportions, and are comparatively inelegant in their forms.

Many of the ancient MSS. found in the ruins of Herculaneum have been carried to Madrid; but a great number were left at Portici. Upon the firſt diſcovery of them, great hopes were entertained that many original works of the claſſics would be reſtored to light. Great pains have been beſtowed, and much ingenuity diſplayed, in ſeparating and unrolling the ſheets without deſtroying the writing. This has ſucceeded in a certain degree; though, in ſpite of all the ſkill and attention of thoſe who have been employed in this delicate work, the copiers are obliged to leave many blanks where the letters are obliterated. The MSS. hitherto unrolled and copied are in the Greek language, and not of a very important nature. Farther efforts are renewed; theſe ſerve to increaſe the probability of recovering thoſe works, the loſs of which has been long lamented by the learned.

HERCULANIA, in *Botany*, a name by which ſome authors have called the *verbena* or *vervain*.

HERCULES, Ἡρακλῆς, in *Aſtronomy*, one of the conſtellations of the northern hemiſphere. See CONSTELLATION.

The ſtars in the conſtellation Hercules, in Ptolemy's catalogue, are 29; in Tycho's, 28; in the Britannic catalogue, 113.

HERCULES, in *Mythology*, a celebrated hero of antiquity, who, on account of his ſingular exploits, was deified by the Pagans. He is ſaid to have been the ſon of Jupiter and Alcmena, the wife of Amphitrion, king of Thebes. Herodotus fixes his birth a hundred years before the taking of Troy by the Greeks, or about the year 1282 before the commencement of the Chriſtian era. According to Blair's Tables, he died in the year 1222 B. C. The adventures for which he was celebrated may be diſtributed into three claſſes; to the firſt claſs we may refer his ſtrangling the two ſerpents which were ſent to deſtroy him in his cradle, and his killing a large lion near his native city Thebes. The ſecond claſs comprehends thoſe exploits which have been commonly called his twelve labours; theſe he undertook by order of Euryſtheus, in conſequence of the fatality of his birth, and of a decree of the Delphian oracle, as ſome ſay, for expiating his crime of killing the three children which he had by his wife Megara, the daughter of Creon, and in order to acquire immortality; the firſt of theſe was his engagement with the Cleonæan lion, in the foreſt of Nemea; the ſecond his conqueſt of the hydra, by which he is ſaid to have cleared the fens of Lerna, near Argos, of the ſerpents that infeſted them, and that ſeemed to multiply as faſt as they were deſtroyed (ſee HYDRA); the third, his deſtruction of the Erymanthian boar; the fourth, his killing the wild ſtag; the fifth, his ſhooting the flying birds called ſtymphalides; the ſixth, his cleanſing Augæas's ſtables; the ſeventh and eighth, his deſtroying the Cretan bull, and Diomed, the barbarous tyrant of Thrace, with his horſes or mares; the ninth labour is his combat with Geryon, who is generally repreſented with three bodies; the tenth, his conqueſt of the Amazon; the eleventh, his dragging Cerberus up from the infernal regions; and the laſt is his killing the ſerpent, and gaining the golden fruit

fruit in the garden of the Hesperides. The third class of Hercules's exploits were those which he voluntarily undertook; the chief of which are his combat with the giant Antæus, whereby he freed Africa from this destroyer, and his killing Cacus, the notorious robber of Italy. These several adventures are represented and described both by the ancient statuaries and poets.

It is observed, that there are none, even of the twelve great gods of antiquity, that have so many ancient monuments relating to them as Hercules. The famous statue of Hercules, in the Farnese palace at Rome, is well known to the connoisseurs; this represents him, resting after the last of his twelve labours above recited, leaning on his club, and holding the apples of the Hesperides in his hand. In this statue, as in all the other figures of him, he is formed, by the breadth of his shoulders, the spaciousness of his chest, the largeness of his size, and the firmness of his muscles, to express strength and a capacity of enduring great fatigue, which constituted the chief idea of virtue among the ancient heathens. His other attributes are his lion's skin, his club, and his bow.

Hercules is represented by the ancients as an exemplar of virtue; however, the *Hercules bibax*, or *Drunken Hercules*, is no uncommon figure, and his amours are described both by the poets and artists. Thus, the Cupids are made to take away his club, and he is exhibited in the posture of bending under a little boy; by which actions we perceive, that he, who conquered all difficulties, was a slave to love. The chief scene of his effeminacies was in Asia, whilst he lived with Omphale, queen of Lydia; and at length, *viz.* in the forty-ninth year of his life, or, as others say, at the age of fifty-two years, about thirty-years before the Trojan war, he fell a sacrifice to the jealousy of his wife Dejanire, who, dreading the influence of his passion for Iole, the daughter of Eurytus, king of Oechalia, poisoned his robe, so that he died in great agonies on mount Oeta. Ovid represents him as preparing his own funeral pile, and laying himself upon it with great composure. Met. ix. ver. 238.

The apotheosis of Hercules, which is said to have been performed by his friend Iolaus, or the establishment of his altars in the principal cities of Greece, is fixed by Thrasybulus, twenty-nine years before the taking of Troy.

Hercules has been particularly honoured by the Greeks, under the name of *Musagetes, the conductor of the Muses*, and at Rome under that of *Hercules Musarum*. He is represented on medals with a lyre in his hand; and the reverse is marked with the figure of the nine Muses with their proper symbols. Spence's Polymetis, p. 113, &c.

There were several persons of celebrity to whom the ancients gave the name of Hercules. Diodorus Siculus reckons three of them; the *first* an Egyptian, who traversed into Africa, and raised the famous pillars near Cadiz, to give notice to voyagers that they were not to attempt proceeding any further. The *second* was born in Crete, among the Idæi Dactyli, and he, it is said, instituted the Olympic games. The *last* was the son of Jupiter and Alcmena, above-mentioned. Cicero reckons six of them. Some Greek authors enumerate forty-three, either because several persons thought to do themselves honour by assuming this name, or, perhaps, because Hercules was not a proper name, but an appellative, derived, as Le Clerc conjectures, from the Phœnician word "Harokel," which signifies Merchant; and this learned author alleges, that the name was formerly given to the famous traders who migrated for the discovery of new countries, and for planting colonies there, and who frequently signalized themselves no less by clearing them of the wild beasts by which they were infested, than by the commerce they established with them; which, without doubt, was the source of ancient heroism and war. Thus it would appear that Hercules is the surname of the several Herculeses mentioned by authors; for the Tyrian was called Phasius; the Phœnician Desanaus or Agenor: the Grecian Alceus or Alcides; the Egyptian, who was contemporary with Osiris, and general of his troops, Osochor or Chon; the Indian, Dorsanes, and the Gaul, Ogmion. But we shall observe, upon the whole, that the Greeks have filled up the history of the Theban Hercules with the exploits of all the rest, with those numerous travels mentioned by the poets who have written his life, and with so many adventures, for which the life of one man would not be sufficient.

Hrrcules's *All-heal*, in *Botany*. See Ginseng, Heracleum, and Pastinaca.

Hercules's *Club*. See Zanthoxylon.

Hercules's *Pillars*, in *Geography*. See Columnæ *Herculis*.

HERCULEUS Morbus, in *Medicine*, the epilepsy; thus called from the terror of its attacks, and the difficulty of cure.

HERCYNIAN Forest, in *Geography*. See Hercinian.

HERD, among *Hunters*, a company or assemblage of black or fallow beasts, in contradistinction to *flock*.

In the hunting language, there are various terms used for companies of divers kinds of game. We say a *herd* of harts and bucks, a *bevy* of roes, a *rout* of wolves, a *richess* of martens, &c. See Hunting.

HERDAL, in *Geography*, a town of Sweden, in the province of Harjedalen; 38 miles S.E. of Langaschauts.

HERDEWICH, Herdewic, or *Herdewych*, in our *Ancient Law-books*, a grange or place for cattle and husbandry.

"Et unam herdewycham apud Hethcotum in pecu, &c." Mon. Angl.

HERDICKE, or Marien Herdicke, in *Geography*, a town of Germany, in the county of Mark, situated on the Ruhr, containing three churches for the three religions, a noble secular abbey for ladies, both Roman Catholic and Protestant; 4 miles S.W. of Schwertz.

HERDING, among *Sportsmen*, is the reverse of breaking herd.

HERDOLA, in *Geography*, a town of Sweden, in the province of Tavastland; 30 miles E.S.E. of Jamsio.

HERDONIÆ, or Herdonia, in *Ancient Geography*, a town of Italy, in Apulia, S.E. of Luceria, upon the road which leads from Beneventum to Canusium. It now lies in ruins at a place called "Hordona."

HERDSMAN, a name applied to denote the keeper of a herd; or one who is employed in tending cattle or other animals that herd together.

HEREAN Mountains, in *Ancient Geography*, mountains of Sicily, described by Diodorus Siculus as eminently distinguished by their singular situation, the excellent qualities of their soil, the abundance of their fountains and streams, and their productiveness in fruits of every kind, so that they formed the most agreeable retreat which the imagination can conceive from the summer heats. This part of the country was so fertile and rich, that it furnished an ample supply for the Carthaginian army in the time of its distress.

HEREBANNUM, in *Antiquity*, a fine of sixty crowns, which was exacted of a freeman, who, being summoned into the field, refused to obey, according to the law of the Franks. This expression seems to imply, that, according to the said law, both the obligation to serve, and the penalty on

on thoſe who diſregarded it, were coeval with the laws made by the Franks at their firſt ſettlement in Gaul. The fine was levied with ſuch rigour, that if any perſon convicted of this crime was inſolvent, he was reduced to ſervitude, and continued in that ſtate until ſuch time as his labour ſhould amount to the value of the *herebannum*. The emperor Lotharius rendered the penalty ſtill more ſevere; and if any perſon poſſeſſing ſuch an extent of property as made it incumbent on him to take the field in perſon refuſed to obey the ſummons, all his goods were declared to be forfeited, and he himſelf might be puniſhed with baniſhment. Murat. Script. Ital. vol. i. part ii. p. 153.

HEREBODE, the king's edict, anciently iſſued to command his ſubjects into the field.

The word is formed of the Saxon, *here*, *army*, and *bode*, *meſſenger*.

HEREDITAMENTS, in *Law*, are ſuch immoveable things as a man may have to himſelf and his heirs by way of inheritance; or which not being otherwiſe bequeathed, do naturally and of courſe deſcend to him who is next heir of blood, and fall not to the executor or adminiſtrator as chattels do.

Hereditaments is a word of large extent, including not only lands and tenements, but whatſoever may be *inherited*, be it corporeal or incorporeal, real, perſonal, or mixed; it is much uſed in conveyances; for by the grant of hereditaments, iſles, feigniories, manors, houſes, and lands of all ſorts, charters, rents, ſervices, advowſons, conveyances, and whatever may be inherited, will paſs.

Hereditaments, in the moſt extenſive ſenſe of the term, are of two kinds, *corporeal* and *incorporeal*. *Corporeal* are ſuch as affect the ſenſes, or ſuch as may be ſeen and handled by the body; *incorporeal* are not the objects of ſenſation, can neither be ſeen nor handled, are creatures of the mind, and exiſt only in contemplation. Thoſe of the former kind conſiſt wholly of ſubſtantial and permanent objects; all which may be comprehended under the general denomination of land only; for land, ſays ſir Edward Coke (1 Inſt. 4.) comprehendeth, in its legal ſignification, any ground, ſoil, or earth whatever; as arable, meadows, paſtures, woods, moors, waters, marſhes, furzes, and heath. It legally includes alſo all caſtles, houſes, and other buildings; for they conſiſt, ſays he, of two things, land, which is the foundation, and ſtructure thereupon; ſo that if I convey the land or ground, the ſtructure or building paſſeth with it. Water is alſo, by a kind of ſoleciſm in the language of law, mentioned as a ſpecies of land; for the land, which the water covers, is permanent, fixed, and immoveable, and therefore, in this I may have a certain, ſubſtantial property, of which the law will take notice, but not of the other.

Land has alſo, in its legal ſignification, an indefinite extent, upwards as well as downwards. "Cujus eſt ſolum, ejus eſt uſque ad cœlum" is the maxim of the law, upwards; therefore no man may erect any building, or the like, to overhang another's land; and, downwards, whatever is in a direct line between the ſurface of any land and the centre of the earth, belongs to the owner of the ſurface; as is every day's experience in the mining countries. So that the word "land" includes not only the face of the earth, but every thing under it or over it. And, therefore, if a man grants all his lands, he grants thereby all his mines of metal and other foſſils, his woods, his waters, and his houſes, as well as his fields and meadows. Not but the particular names of the things are equally ſufficient to paſs them, except in the inſtance of water; by a grant of which nothing paſſes but a right of fiſhing (Co. Litt. 4.); but the capital diſtinction is this, that by the name of a caſtle, meſſuage, toft, croft, or the like, nothing elſe will paſs, except what falls with the utmoſt propriety under the term made uſe of; but, by the name of land, which is *nomen generaliſſimum*, every thing terreſtrial will paſs. (Co. Litt. 4, 5, 6.)

An *incorporeal* hereditament is a right iſſuing out of a thing corporate (whether real or perſonal), or concerning, or annexed to, or exerciſible within, the ſame. (Co. Litt. 19, 20.) It is not the thing corporate itſelf, which may conſiſt in lands, houſes, jewels, or the like, but ſomething collateral thereto, as a rent iſſuing out of thoſe lands or houſes or an office relating to thoſe jewels. Incorporeal hereditaments are principally of ten ſorts: *advowſons*, *tithes*, *commons*, *ways*, *offices*, *dignities*, *franchiſes*, *corodies* or *penſions*, *annuities*, and *rents*. See each article reſpectively.

HEREDITARY, ſomething appropriated to a family, or belonging to it by right of ſucceſſion, from heir to heir.

Of monarchies, ſome are hereditary, others elective: of hereditary monarchies, ſome deſcend only to the heirs-male, as was the caſe in France; others to the next of blood, whether male or female, as in England, Spain, &c.

HEREDITARY is alſo applied to offices and honours annexed to certain families. Thus the office of earl marſhal and lord great chamberlain of England, are hereditary in the families of the duke of Norfolk and the duke of Ancaſter.

It is of no very long date, that the dignities of duke, count, &c. became hereditary.

The canon law has taken all poſſible precautions to prevent beneſices from becoming hereditary.

The abolition of hereditary juriſdictions in 1755, forms an epoch in the hiſtory of Scotland, as it laid the firſt foundation of its ſubſequent proſperity.

HEREDITARY is alſo applied figuratively to good or evil qualities, habitudes, &c. capable of being tranſmitted by blood from father to ſon. See HEREDITARY *Diſeaſes*.

HEREDITARY *Right* denotes a right or privilege, in virtue whereof a perſon ſucceeds to the effects of his anceſtors.

The nonjurors, &c. hold hereditary right to be *divine* right, *i. e.* of God's own appointment; and conſequently indiſpenſible, or, as they call it, *indefeaſible*. On this account they contend for the obligation of hereditary right in favour of the deſcendants of king James II. See *Right of* CROWN.

HEREDITARY *Diſeaſes*, are thoſe diſeaſes which affect individuals of the ſame family in ſucceſſive generations. Such are, according to univerſal obſervation, epilepſy, inſanity, pulmonary conſumption, gout, rheumatiſm, ſcrofula, ſtone and gravel, and ſome other maladies.

Strictly ſpeaking, it has been ſaid, the term *hereditary diſeaſe* is not juſtly applicable in theſe inſtances; ſince the maladies in queſtion are not actually born with a perſon, but commonly occur, in conſequence of the operation of ſome occaſional cauſe, at an after period of life. Upon ſuch a quibbling conſideration of the ſubject, ſome authors have denied the exiſtence of hereditary *diſeaſes* altogether, and maintained that an hereditary *predispoſition* to certain diſeaſes, is alone brought into the world with us. The diſpute is merely verbal; if we uſe the word *connate*, inſtead of hereditary, it is obvious that it is applicable only to the predispoſition. (See CAUSE in *Medicine*.) As the diſeaſes in queſtion are connected with certain peculiarities of conſtitution, many of which are characterized by peculiarities of form and ſtructure, (ſuch as the texture and ſtrength of the limbs, muſcles, ſkin, hair, the complexion, &c.) and as theſe characteriſtics of various conſtitutions are conſtantly tranſmitted from the parent to the offspring; ſo a diſpoſition to have the

ſame

ſame diſeaſes brought on, when certain exciting cauſes are applied, is as neceſſarily conveyed from our progenitors, as the family likeneſs; and the fact is to be explained upon the ſame principle. By an hereditary diſeaſe, therefore, is not meant the tranſmiſſion of any morbid juices, or peccant humours, or any *materies morbi*, from the parent to the child; but merely that the child, partaking of the conſtitution of his parent, will be liable to ſimilar diſeaſes. See TEMPERAMENT.

HEREFORD, in *Geography*, a city and principal town of Herefordſhire, England, ſtands on the banks of the river Wye. At an early period this place is noted in the Anglo-Saxon annals. In the year 676 and 680, ſynods were held here, after Peada, king of Mercia, had embraced the Chriſtian religion: and it was then decreed that a new ſee ſhould be formed in this kingdom. Putta was choſen the firſt biſhop. It is hence inferred, that Hereford had then become populous, and was a place of the firſt conſequence in that part of the country; and it is fairly conjectured, that it owes its origin and early eſtabliſhment to deſertion from, and depopulation of Magna Caſtra, or Kenchester, a Roman ſtation in the vicinity. On the ſubdiviſion of the iſland by the Anglo-Saxon monarchs, Hereford became the capital of the Mercian kingdom, and had a large church conſtructed in it as early as the reign of Offa. Indeed this monarch founded a cathedral here, in expiation of the murder of Ethelbert, king of the Eaſt-Angles. This church, and the holy tomb within it, attracted numerous pilgrims and Catholic devotees, many of whom beſtowed handſome gifts and bequeſts on the foundation. In the time of king Athelſtan the city was fortified by walls, remnants of which ſtill remain. The extent of the city may be aſcertained by the circumference of this fortified encloſure, which meaſured 1800 yards. Beſides this there was an extent of 550 yards guarded by the river, which ſerved as a natural barrier. In the walls were ſix gates; and 15 embattled towers were attached to, and ſerved to guard the walls. Theſe were 34 feet in height, and the walls were 16 feet high. Leland deſcribes the fortifications as tolerably perfect when he viſited Hereford.

Seated near the borders of England and Wales, this place has been repeatedly ſubject to ſieges and war-like operations, in many of the conteſts between thoſe nations. Here Athelſtan bound the Britons, in the year 939, to pay a tribute of 20*l.* in gold, 300 in ſilver, and 200 head of cattle, beſides hawks and hounds, as a tribute of allegiance and ſubjection. The Welſh, in the 11th century, made an irruption into the marches, but were repulſed by the garriſon of Hereford: again, in 1055, they came in a more formidable body, headed by Gryffyth, a ſovereign of Wales, and Algar, earl of Cheſter. The forces of Hereford gave them battle near the city, but were defeated, and on retreating to their fortifications, were cloſely purſued by the Welſh. Both armies entered the city, and the place became a ſcene of plunder, ſlaughter, and havoc. The cathedral and ſeveral houſes were conſumed by fire. This ſavage occurrence is particularly deſcribed in Powell's Chronicle of Wales. Harold, ſon of earl Godwin, collected an army and marched againſt the Welſh, whom he compelled to ſue for peace. Returning to Hereford, he rebuilt or repaired the fortifications, and erected a caſtle, on the eaſt ſide of the cathedral, cloſe to the banks of the river

The Domeſday book contains many intereſting particulars relative to the cuſtoms and tenures of this city and its ſuburbs; whence may be deduced the conſequence which Hereford had then attained: though its inhabitants, both within and without the walls, are, in the ſame record, ſtated to have been only 103 in the time of Edward the Confeſſor. The whole town paid to the Conqueror 60*l.* in ſilver coin, which, together with the emoluments ariſing from eighteen manors, accounted for in Hereford, amounted to 335*l.* 18*s.* beſides the mulcts, and other profits, ariſing from the hundred and county courts. After the Norman ſubjugation, the caſtle, &c. were granted to and governed by the earls of Hereford. At the time of the barons' confederacy againſt Henry III., one of the firſt acts of hoſtility was committed at Hereford in 1262, where the biſhop, Peter de Aqua-Blanca, was arreſted and expelled the kingdom: in the following year the king, in a letter dated Hereford June 5, commanded him to repair forthwith to his church, on pain of confiſcation of his temporalities: he obeyed, but was ſeized in his cathedral by the barons, and his wealth was diſtributed to the ſoldiers. Hereford, from its vicinity to the Welſh frontiers, was ſubjected to continual alarm from the contending parties: and when the caſtle was beſieged and taken by the earl of Leiceſter, the city was partly deſtroyed by fire. In the reign of Edward III., when an unſucceſsful attempt was made by ſome of the chieftains of Wales to regain independence, Mael Gwyn Vychan and two of his aſſociates were impriſoned, and afterwards hanged in this city. The great council of the realm, which depoſed Edward II. was aſſembled in Hereford; and here his favourite, the younger Spencer, was executed on a gallows 50 feet high, by the queen's order. The earl of Arundel, and three others of Spencer's friends, were alſo put to death in this city. Nothing of hiſtorical importance is recorded in the annals of Hereford afterwards, till the commencement of hoſtilities betweeen Charles I. and his parliament, when this city is deſcribed by lord Clarendon, as "a town very well affected, and reaſonably well fortified, having a ſtrong ſtone wall about it, and ſome cannon; and there being in it ſome ſoldiers of good reputation, many gentlemen of honour and quality, and three or four hundred ſoldiers, beſides the inhabitants well armed." Yet with all theſe advantages, it was ſurrendered to ſir William Waller without the loſs of a man on either ſide. It was ſoon afterwards re-occupied by the royaliſts; and in 1645, ſuſtained a cloſe but ineffectual ſiege for a month from the Scotch auxiliaries under the earl of Leven. The entrenchments thrown up by the Scots are ſtill viſible on different ſides of the city.

Among the public buildings of Hereford, the cathedral, though deprived of much of its venerable appearance by the fall of the weſtern front in 1786, ſtill ſtands pre-eminently conſpicuous. This ſtructure, as already mentioned, owes its origin to the murder of Ethelbert, king of the Eaſt Angles, by the Mercian king, Offa, whoſe many valuable donations to the church which previouſly occupied the ſame ſcite, and had been dedicated to St. Mary, have occaſioned him to be ſometimes conſidered as the founder of the new cathedral (in the conſtruction of which thoſe gifts were applied) erected by Milfrid, a viceroy or provincial governor under Egbert, about the year 825. In leſs than 200 years this fabric appears to have fallen in ruins, and biſhop Athelſtan, or Ethelſtan, rebuilt it during his prelacy, which continued from 1012 to 1055. This building was again deſtroyed by fire, and continued in ruins till the year 1079, when Robert de Lozinga, who was appointed biſhop by king William I., commenced a new edifice. This was completed by the biſhop Raynelm, who was inducted to the ſee in 1107. In the calendar of obits this biſhop is recorded to be founder of the church. About a century after the deceaſe of Raynelm, the great central tower was built by biſhop Bruce, who ſat here from 1200 to 1216.

Further additions and alterations were progreſſively made by different prelates: among which the fine northern porch was built by biſhop Booth between the years 1516 and 1535, and the choir was fitted up and decorated by dean Tyler, about the year 1720. A very memorable epoch in the hiſtory, and architectural character of this grand eccleſiaſtical ſtructure, may be referred to the year 1786, when the great weſtern tower fell, and buried beneath its ruins part of the nave, and nearly the whole of the weſt front. The latter has been rebuilt, in an incongruous ſtyle of architecture, by James Wyatt, eſq., architect: the expences attending which amounted to nearly 18,000*l*. At the ſame time 2000*l*. more were expended in repairing the central tower and other parts of the building. The plan of this cathedral is that of a croſs, with a ſmall tranſept towards the eaſt, and a St. Mary chapel. At the interſection of the chief tranſept with the nave and choir, riſes a large ſquare tower. The exterior diſplays ſeveral diſſimilar parts, of various dates, and various ſtyles: but the interior is more in uniſon, and preſents ſome intereſting features. The nave is divided from the aiſles by two rows of maſſive columns, ſuſtaining ſemicircular arches. Over theſe is a row of arcades on each ſide, having pointed arches. At the north end of the great tranſept, is a part divided from the aiſle, and appropriated as the pariſh church of St. John the Baptiſt. The choir is lofty, and contains 50 ſtalls with fine ornamented canopies. Eaſt of this is the Lady chapel, now uſed as a library-room, and ſtored with a valuable collection of books. Beneath this is a crypt, which, from containing a maſs of human bones, is called Golgotha. The dimenſions of the cathedral are as follows: extreme length 325 feet; 130 of which are occupied by the nave; 96 by the choir, and the library, &c. the remainder. Great tranſept 100 feet from north to ſouth. Breadth of the nave and ſide aiſles 74 feet: height from pavement to the vaulting 70 feet. This edifice contains ſeveral intereſting monuments; though many were deſpoiled and pilfered at the reformation, and during the civil wars. Among the remaining the following are entitled to particular notice: one to Thomas Cantilupe, biſhop, who died in 1282, and was canonized in 1310; an altar tomb to biſhop Aqua-Blanca, who died in 1268; in the north wall of the library are two ancient monuments, ſaid to commemorate Humphry de Bohun, earl of Hereford, and his counteſs: ſeveral other biſhops, deans, &c. were interred within the walls of this cathedral, among whom the following names and dates of their reſpective deaths occur: biſhop Biſe, 1721; biſhop Braoſe, 1215; ſir Richard Pembruge, or Brydges, 1375; biſhop Booth, 1535; Robert de Lozinga, 1095; Raynelm, 1115; Galfrid de Clive, 1119; Robert de Betun, 1148; Robert de Melun, 1167; John Phillips, poet, 1708.

Connected with the cathedral are ſeveral buildings: ſome of which are entitled to the notice of the antiquary; particularly the biſhop's palace, the biſhop's cloiſters, the deanery and prebendal houſes, the college, &c.

Previous to the civil war Hereford contained five pariſh churches, beſides the cathedral, reſpectively dedicated to St. Peter, All-Saints, St. Nicholas, St Martin, and St. Owen. Of theſe only the three former remain. In the city are chapels for each of the following ſects: Methodiſts, Diſſenters, Roman Catholics, and Quakers. Previous to the reformation Hereford abounded with monaſtic eſtabliſhments, but moſt of the buildings belonging to them have fallen to ruin, or been taken down. On the north ſide of the city are ſome remains of a monaſtery of Black-friars, and near them is the greater part of a *preaching-croſs*, or ſtone pulpit. Beſides ancient alms-houſes, hoſpitals, &c. here is a modern building, called a General Infirmary, for the reception and accommodation of 70 patients, a lunatic aſylum, a county gaol, a ſhire hall, &c. Since the year 1774 very conſiderable improvements have been made in this city. An act of parliament having been then obtained for the purpoſe of regulating the "lighting, paving, pitching, and repairing the ſtreets, lanes, and paſſages," of Hereford and its ſuburbs. This city was firſt incorporated by Henry III., and has received ſeveral renewed and enlarged charters by other ſucceeding monarchs. It returned members to parliament in the 23d year of Edward I. The right of election is wholly veſted in the freemen, amounting to about 1200. The chief manufacture of the place is gloves; ſome flannel and hat manufactories have been alſo eſtabliſhed here. The theatre of Hereford claims ſome notice from having been the nurſery of a Clive, a Siddons, and a Kemble. In the year 1800 the city was officially declared to contain 1460 houſes and 6828 inhabitants. Many perſons of eminence have been born here, as is evinced by a liſt of the following names: Roger of Hereford, biſhop Miles Smith, John Gwillim, John Davies, Richard Gerthinge, Eleanor, or Nell Gwynn, general Stringer Lawrence, Capt. James Cornwall, and David Garrick. The charitable eſtabliſhments of this city are numerous, and of conſiderable utility: they are known under the names of hoſpitals, alms-houſes, charity-ſchools, &c. St. Ethelbert's hoſpital, or alms-houſe, was originally built and endowed in the reign of Henry III., for the maintenance, &c. of ten poor perſons, who were to be nominated and governed by a maſter. The latter is uſually united with the office of treaſurer of the cathedral. St. Giles' hoſpital was founded in the year 1290: but the preſent building was erected in 1720; and is appropriated to the uſe of five poor men. Williams' hoſpital was erected in 1601, and endowed by Richard Williams, to accommodate ſix poor men. The two latter hoſpitals are governed by the mayor and corporation. Trinity hoſpital was eſtabliſhed in the year 1601, by Thomas Kerry, for the ſuppert and reſidence of a corporal, two other unmarried men, and 12 poor widows. Coningſby's hoſpital is a large building, of rather unuſual appropriation. It was erected, and a revenue provided for its ſupport, by ſir Thomas Coningſby, knight, in the year 1614. The building is quadrangular, and comprifes twelve ſuits of apartments, a chapel, a hall, and ſuitable appurtenances. The eſtabliſhment conſiſts, according to the articles of the founder, of eleven military men in neceſſitous circumſtances, and a chaplain. The maſter is ſtyled corporal Coningſby, and the other members are called ſervitors. This eſtabliſhment is chiefly ſupported from the Hampton court eſtate in this county. Weaver's hoſpital was founded in the year 1641, by Richard Weaver, for the reception of five poor perſons. Three other hoſpitals in the city are known by the names of Lazarus's, or the Sick-man's, for ſix widows. Shellay, for the ſame number and claſs of perſons: and Price's, for 12 poor men, and a chaplain. The Hereford charity-ſchools provide for the cloathing, education, &c. of 50 boys and 30 girls. In the vicinity of this city are ſeveral ſeats, and objects of antiquity, &c. worthy the examination of a traveller. About one mile to the weſt is the baſe and ſeven ſteps of a ſtone ſtructure called the White-Croſs, of a ſimilar deſign to the beautiful ſtone croſſes erected by king Edward I. in memory of his queen. (A view and particular deſcription of it is given in Britton's Architectural Antiquities.) The Wear, a ſeat of William Parry, eſq. is pleaſantly ſituated on the bank of the Wye, five miles W. of Hereford. Garnon's, about ſeven miles from the city, is the ſeat of ſir John Geers Cotterell, bart. At the diſtance of two miles N.E. of the latter is Foxley, the ſeat of Uvedale Price, eſq. the learned and eloquent author of

of "Eſſays on the Picturesque." The houſe, a plain brick building, contains ſeveral fine and intereſting pictures by Claude, Pouſſin, Salvator Roſa, Rembrandt, Vandervelde, &c. from a contemplation of which, and the highly picturesque ſcenery in the vicinity of the houſe, Mr. Price appears to have derived many of the maxims and opinions which are contained in his volumes. Two miles from the houſe is a lofty knoll, or mountain, called Lady-liſt, which commands proſpects of an extenſive, diverſified, and highly intereſting tract of ſcenery. On another eminence, called Credenhill, three and a half miles S.E. of Foxley, are the traces of an encampment, which comprehended an area of nearly 40 acres. The view from this hill is ſaid to be the moſt extenſive of any in the county. A mile and a half S.W. of this, and five miles W. from Hereford, is Kencheſter, where the Romans had a grand military ſtation. Traces of walls and embankments are ſtill remaining, and various relics of the arts and cuſtoms of the Romans have been found here. At Sutton's Walls, five miles N. of Hereford, is an encampment, which is traditionally ſaid to have been the ſcite of Offa's palace. Seven miles from Hereford is Burghope houſe, an ancient manſion, which formerly belonged to the families of Goodyere and Dineley, and is now the property of lord Selſey. Longworth, the ſeat of Robert Phillipps, eſq. about four miles E. of Hereford, is a handſome modern building, ſurrounded by pleaſure-grounds and fine plantations. At Stoke, or Stoke-Edith, is a modern church, built at the ſole expence of Thomas Foley, eſq. in 1740; and a large, handſome manſion belonging to Edward Thomas Foley, eſq. Sufton, a modern houſe built of Bath-ſtone, is the ſeat of James Hereford, eſq. This place has belonged to his anceſtors from the reign of Henry III. At Rotherwas, about three miles S.E. of Hereford, is a ſpacious and reſpectable houſe, the ſeat of Charles Bodenham, eſq. On Dynedor-hill, near Rotherwas, are veſtiges of an ancient encampment, traditionally ſaid to have been occupied by Oſtorius Scapula. Aconbury-hill, five miles S. of Hereford, is a bold, commanding eminence, and has the traces of a large ſquare encampment on its ſummit. Eaton camp, about five miles W. of this city, is deſcribed as a Britiſh fortification, comprehending an area of nearly 40 acres of land. About two miles W. of Hereford is Belmont, the delightful ſeat of J. Matthews, eſq. late M.P. for this county. Duncomb's "Collection towards the Hiſtory and Antiquities of the County of Hereford," 4to. 1804.—"The Hereford Guide," &c. 12mo. 1806; a very uſeful and judicious topographical vade mecum.

HEREFORD *and Glouceſter Canal*, is an inland navigation in theſe counties, made in purſuance of acts of parliament paſſed in the years 1791 and and 1793, of which an account is given in our article CANAL; to which it may be proper to add, that the S.E. end of this canal, acroſs Alney iſle, is now abandoned, on account of the damage to which it is liable from the floods of the Severn.

HEREFORDSHIRE, one of the inland counties of England, is bounded on the W. by part of Wales, and from being a border county, was, previous to the final annexation of Wales to England, the ſcene of almoſt perpetual warfare. Hence we find that moſt of its eminences have been fortified, and many of its chief towns and manors have veſtiges of caſtellated ſtructures. At the period of the Roman invaſion this diſtrict was inhabited by the Silures, who alſo occupied the adjacent counties of Radnor, Monmouth, and Glamorgan, together with that part of Glouceſterſhire which lies weſtward of the Severn. The Silures were a brave and hardy people, and for a conſiderable period retarded the progreſs of the Roman arms; but being overpowered by the military talents of Julius Frontinus, they retired into the faſtneſſes of Wales, offering no farther reſiſtance to Roman domination; and the complete and undiſturbed poſſeſſion of South Britain was by this ſucceſs inſured to the conquerors, who included Herefordſhire in the diſtrict named Britannia Secunda. Two of the principal ſtations of the Itinerary of Antoninus, namely, Magna, now Kencheſter, and Ariconium, near Roſs, together with the ſmaller port of Bravinium, or Brandon, are ſituated within the limits of this county. The Watling Street enters it on the north from Shropſhire, near Leintwardine, where it paſſes the river Teme, and conducts to the camp of Brandon. A ſecond Roman road, ultimately joining with the former at Uſk, enters Herefordſhire on the ſouth-eaſt from Glouceſterſhire; and appears to have connected the ſtations of Glevum or Glouceſter, Aricomium, Bleſtium or Monmouth, and Burium or Uſk. A third Roman road enters this county from Worceſterſhire, and paſſing Frome Hill, Stretton Granſham or Grandiſon, Lugg-bridge, Holmer, and Stretton-Sugwas, extends to Kencheſter. A fourth ancient road, called the Ridge-way, is met with to the ſouth of the Herefordſhire beacon, extending ſeveral miles towards Eaſtnor, in a circular direction.

On the decline of the Roman power, the Silures were the foremoſt in endeavouring to regain their independence, and to ſtem the torrent of Saxon uſurpation: but reſiſtance being unavailing, the Britons were driven back to Wales, and Offa incorporated Herefordſhire with the Saxon kingdom of Mercia. The original line of demarcation, which had been the river Severn, was now violated, and the famous dyke, called Clawdd Offa, or Offa's Dyke, was made by that prince to ſecure his conqueſts, which comprehended nearly the whole of this county, together with conſiderable portions of Radnorſhire, Monmouthſhire, and Shropſhire. Still further to repreſs the repeated incurſions of the Britons, Offa removed his court to South-town, now Sutton, about three miles north-weſt from Hereford, where he erected a palace, on an eminence, defended by ſtrong entrenchments. About the end of the eighth century the Danes obtained a temporary poſſeſſion of Mercia, but were expelled by Burthred the lawful heir, who, after a reign of twenty years, was defeated by theſe invaders and deprived of his kingdom; which was ſoon afterwards ſubdued by Alured, king of the Weſt Saxons, who united it to his own.

Herefordſhire is bounded on the north by Shropſhire; on the north-eaſt, and eaſt, by Worceſterſhire; on the ſouth-eaſt, by Glouceſterſhire; on the ſouth-weſt, by Monmouthſhire; on the weſt, by Brecknockſhire; and on the north-weſt, by Radnorſhire. Its form is nearly an ellipſis; but ſome detached parithes are ſituated beyond the general outline: of theſe, Farlow is ſurrounded by Shropſhire; Rochford is included in the county of Worceſter; and Lytton-hill in that of Radnor: a conſiderable tract of land, called the Futhog, with a few acres on the Devaudin-hill, is inſulated by Monmouthſhire. Its greateſt extent, from Ludford on the north, to the oppoſite border, near Monmouth on the ſouth, is thirty-eight miles: its greateſt width, from Clifford on the weſt, to Cradley on the eaſt, is thirty-five miles. It includes about 800,000 acres; and is divided into eleven hundreds, containing 221 pariſhes, one city, and ſix market towns: the number of houſes, as enumerated under the act of 1801, was 19,763; that of inhabitants 89,191: its boundaries are moſtly artificial.

The general aſpect of the county is extremely picturesque and intereſting to the traveller: its ſurface is finely diverſified, and broken by ſwelling heights, ſo as greatly to reſemble the more central parts of Kent. The ſoil is chiefly a mix-

a mixture of marle and clay, containing a large proportion of calcareous earth. The ſubſtrata are moſtly lime-ſtone of different qualities; in ſome parts, particularly near Snod-hill-caſtle, it aſſumes the properties of marble, and becomes beautifully variegated with red and white veins. Towards the weſtern borders the ſoil is cold and retentive of moiſture; but ſtill argillaceous, with a baſe of ſoft crumbling ſtone, which decompoſes on expoſure to the atmoſphere; or of nodules of impure lime-ſtone. The eaſtern ſide of the county is principally a ſtiff clay, of great tenacity and ſtrength, and in many places of a red colour: a great proportion of the hundred of Wormelow, on the ſouth, is a light ſand. Deep beds of gravel are occaſionally found in the vicinity of Hereford; and the ſub-ſoil of ſeveral of the hills are of ſiliceous grit. Fuller's earth is ſometimes dug near Stoke; and in different parts of the county are ſmall quantities of red and yellow ochres, with tobacco-pipe clay. Iron ore has been met with in the parts bordering on Glouceſterſhire, but none has been dug lately; though, from the conſiderable quantities that have been diſcovered, imperfectly ſmelted, and from the remains of hand-blomaries that have alſo been found, it has been thought that ſome iron-works were eſtabliſhed here as early as the time of the Romans.

Herefordſhire is particularly famous as a cyder country; yet this, though a favourite object of its huſbandry and commerce, is by no means the only one: cattle, ſheep, ſwine, corn, hops, &c. have equally ſtrong claims on the attention of the farmer. Plantations of fruit-trees are found in every aſpect, and on ſoils of every quality, and under every ſpecies of culture. The moſt approved ſcite is that which is opened to the ſouth-eaſt, and ſheltered in other points, but particularly in the oppoſite direction; for though Virgil and other Roman poets celebrate the weſt wind as the moſt genial in Italy; and Philips, in his poem on cyder, recommends the ſame aſpect; yet it is an unqueſtionable fact, that the weſterly winds, and therefore a weſterly expoſure, are particularly unfavourable to the fruit-trees of Herefordſhire: theſe winds are more cold, as blowing over a conſiderable tract of the Welſh mountains, which are often covered with ſnow even late in the ſpring; and they are more unkind, becauſe from that point proceeds a much more than equal proportion of thoſe fogs and blue miſts, which Dr. Beale calls "the diſguſts of the Black Mountain." The period at which the cultivation of orchards became a pre-eminent branch of the rural economy of England, appears to have been early in the reign of Henry VIII., when the example of a perſon named Harris, the king's fruiterer, who had occaſioned the fields and environs of about thirty towns and villages, in Kent, to be planted with fruit-trees, extended this ſpecies of culture to ſeveral parts of the kingdom. The particular era, however, when the plantations of Herefordſhire acquired the peculiar eminence which they yet retain, was the reign of Charles I., when, by the ſpirited exertions of lord Scudamore, of Holm-Lacy, and other gentlemen of the county, Herefordſhire became, in a manner, one entire orchard. For a particular deſcription of the various kinds of apples cultivated in this county, ſee Marſhall's Obſervations on the Management of Orchards and Fruit Liquor in Herefordſhire, annexed to his ſecond volume of "The Rural Economy of Glouceſterſhire."

The Herefordſhire cattle are regarded, by the beſt informed judges, as the moſt ſuperior breed in the kingdom. The other breeds, which nearly reſemble them, are thoſe of Devonſhire and Suſſex, and of the Vale of Pickering in Yorkſhire. They are of the middle-horned kind; of a large and athletic form; and unuſually ſleek in appearance, from the bright and ſilky nature of the coating. The prevailing colour is a reddiſh-brown, with white and bald faces. The rearing of oxen for agricultural purpoſes is a very general practice; nearly half the ploughing of the whole county is performed by them, and they are equally employed in the labours of the harveſt. The breed of ſheep in this county is almoſt equally as celebrated as that of its cattle: the name by which they are diſtinguiſhed is the Ryeland, from a diſtrict in the ſouthern part of the county, where the moſt ſuperior varieties are fed.

The cultivation of hops forms a very conſiderable branch of the rural economy of Herefordſhire, and is ſtill increaſing, particularly in the parts bordering on Worceſterſhire. They appear to have been introduced into this county ſoon after they were imported into England about the commencement of the ſixteenth century; and by the middle of the following century, the cultivators had greatly extended their plantations, and become conſiderably more numerous. The hops of this county are of two kinds, white and red; but each of theſe has ſeveral varieties: the white hops are the moſt delicate, and have the preference with the buyers; though the red kinds are more hardy, and impart a ſtronger quality in brewing.

Herefordſhire may, with propriety, be termed a woodland county; many ſpecies of trees growing up ſpontaneouſly, and becoming ſtrong and vigorous in a very ſhort period. The oak, elm, poplar, and willow are particularly flouriſhing; but are ſeldom ſuffered to attain full maturity, unleſs on the eſtates of the nobility, and moſt wealthy landed proprietors. Coppice-wood is extremely abundant; the ſides and ſummits of many of the hills and upland grounds being covered with extenſive plantations. The aſh coppices are very valuable and numerous; thoſe of alder are alſo plentiful in low and marſhy ſituations: the former are regulated under a general ſyſtem, and are cut about once in eight, ten, or twelve years, according to the uſes for which the wood is deſigned. The principal part of the county is incloſed; and as moſt of the incloſures are bounded by hedge-rows, it has a very woody appearance.

The principal rivers and ſtreams of Herefordſhire are the Wye, the Lugg, the Munnow, the Arrow, the Frome, the Team or Teme, and the Leddon. The Wye has been often celebrated for the extremely picturеſque and diverſified ſcenery which adorns its meandering channel. This river is navigable to Hereford for barges of from eighteen to forty tons; but either a large or a ſmall ſupply of water is equally fatal to the navigation. The Lugg has its ſource in Radnorſhire, but enters Herefordſhire on the north-weſt ſide, near Stapelton-caſtle: thence flowing in a ſouth-eaſt direction, it receives the Pinſley near Leominſter; and afterwards inclining to the ſouth, is increaſed by the waters of the Arrow and the Frome. Soon after its junction with the latter, it falls into the Wye, near Mordisford. The Munnow riſes on the Herefordſhire ſide of the Hatterell mountains, and in its courſe through the county is increaſed by the ſtreams called Eſele, Olchron, Hothny, Dore, and Werme; it forms the boundary between Herefordſhire and Monmouthſhire, till it quits the former at Llanrothal, and flowing towards Monmouth, is received by the Wye immediately below that town. The Team enters this county from the confines of Radnorſhire and Shropſhire, a ſhort diſtance north-weſt from Brampton Bryan, and flowing eaſtward runs into Shropſhire near Ludlow. In the muſcle-ſhells of the river, pearls have occaſionally been found. The Leddon riſes above Boſbury on the eaſt ſide of the county, and running ſouthward gives name to the town of Ledbury; thence flowing into Glouceſterſhire, it

unites

unites with the Severn. The inland navigation of Herefordſhire is very imperfect; though ſcarcely any county, poſſeſſing neither iron-works, nor any principal manufacture, can have greater occaſion for its aids.

Herefordſhire returns eight members to parliament: *viz.* two for the county, two for the city, two for Leominſter, and two for Weobly. Ledbury, Roſs, and Bromyard, were formerly privileged to ſend repreſentatives, but were excuſed on a petition of inability to ſupport them. This county is included in the dioceſe of Hereford. Duncumb's "Collections towards the Hiſtory and Antiquities of the County of Hereford," 4to. 1804. "General View of the Agriculture of Herefordſhire," by John Duncumbe, M. A. 8vo.

HEREGELD, in our *Old Writers*, a tribute or tax levied for the maintenance of an army. See SUBSIDY.

HEREN. See HARAN.

HERENTHALS, in *Geography*, a town of France, in the department of the Two Nethes, and chief place of a canton, in the diſtrict of Tarnhout; 16 miles E. of Antwerp. The place contains 2541, and the canton 13,305 inhabitants, on a territory of 267½ kiliometres, in 13 communes.

HERESIARCH, *Arch-heretic*, the founder or inventor of a hereſy, or a chief and ring-leader of a ſect of heretics. The word is Greek, αἱρεσιαρχης, compounded of αἱρεσις, *hereſis*, *hereſy*, and αρχος, *princeps*, *prince*, *chief*.

Thus Arius and Socinus are called hereſiarchs, as being the founders and patriarchs of the Arians and Socinians. Simon Magus is recorded as the firſt hereſiarch under the new law.

HERESY, an error in ſome eſſential point of Chriſtian faith, maintained with obſtinacy, and diſingenuity.

It is properly the obſtinacy that conſtitutes the character of hereſy, not the error. When a man is humble and ingenuous, ready and deſirous to receive farther light and inſtruction, and when he gives every thing urged againſt him its due weight, he is not guilty of hereſy. "Errare poſſum, hæreticus eſſe nolo," is a celebrated maxim of St. Auguſtine.

Tertullian, in his treatiſe Of Preſcriptions, defines hereſy by *choice*, agreeably to the etymology of the word. A heretic, in this ſenſe, is one who, knowingly and of his own choice, propoſes, or even embraces, any new dogma or article of faith.

The word is formed of the Greek αἱρεσις, from αἱρεω, *I chuſe*, which, among the ancients, had nothing of that odious ſignification attached to it by eccleſiaſtical writers of later times. It only ſignified a peculiar opinion, dogma, or ſect, without conveying any reproach; ſince it was indifferently uſed, either of a party approved or of one diſapproved, by the writer.

In this ſenſe they ſaid, the hereſy of the Stoics, of the Peripatetics, &c. meaning their ſect, their ſyſtem, &c.

Thus alſo in the New Teſtament, we read of the ſect or hereſy of the Sadducees, of the Phariſees, of the Nazarenes, &c. See Acts, v. 17. ch. xv 5. ch. xxiv. 5. ch. xxvi. 5. ch. xxviii. 22.

In the two former of the paſſages above cited, the term is adopted by the hiſtorian, merely for diſtinction's ſake, without the leaſt appearance of intention to convey either praiſe or blame. In Acts, xxvi. 4, 5, Paul, in his ſelf-defence before king Agrippa, uſes the term, when it was manifeſtly his deſign to exalt the party to which he had belonged, and to give their ſyſtem the preference to every other ſyſtem of Judaiſm, both in ſoundneſs of doctrine, and purity of morals. In Acts, xxiv. 5, there is an appearance that ſomething reproachful is meant to be conveyed under the term αἱρεσις. But we ſhould have had no reaſon for imagining, that any part of the obloquy lay in the application of the word laſt mentioned, if it had not been for the notice which the apoſtle takes of it in his anſwer; Acts, xxiv. 14. In the Engliſh tranſlation, however, which follows the Vulgate, there is an obvious impropriety; becauſe the ſame word is rendered one way in the charge brought againſt the priſoner, and another way in his anſwer for himſelf. The conſequence is, that though nothing can be more appoſite than his reply, in this inſtance, as it ſtands in the original, yet nothing can appear more foreign than this paſſage, in the two verſions above-mentioned. The apoſtle ſeems to defend himſelf againſt crimes, of which he is not accuſed. In both places, therefore, the word ought to have been tranſlated in the ſame manner, whether "hereſy" or "ſect." The laſt term ſeems to be the only proper one; for the word "hereſy," in the modern acceptation, never ſuits the import of the original word, as uſed in ſcripture. But, if we attend to the peculiar circumſtances of the apoſtle at this time, the difficulty in his having conſidered it as a reproach to be denominated of a "ſect," diſclaimed by the whole nation, inſtantly vaniſhes. Let it be remembered, firſt, that ſince the Jews had fallen under the power of the Romans, their ancient national religion had not only received the ſanction of the civil powers for the continuance of its eſtabliſhment in Judea, but had obtained a toleration in other parts of the empire; ſecondly, that Paul is now pleading before a Roman governor, a Pagan, who could not well be ſuppoſed to know much of the Jewiſh doctrine, worſhip, or controverſies; and that he had been arraigned by the rulers of his own nation, as belonging to a turbulent and upſtart ſect; for in this way they conſidered the Chriſtians, whom they reproachfully named Nazarenes. The natural conſequence of this charge, with one who underſtood ſo little of their affairs as Felix, was, to make him look upon the priſoner as an apoſtate from Judaiſm, and, therefore, as not entitled to be protected, or even tolerated, on the ſcore of religion. Againſt a danger of this kind, it was of the utmoſt importance to our apoſtle to defend himſelf. Accordingly, the apoſtle, with great addreſs, refutes the charge of having revolted from the religious inſtitutions of Moſes, and, at the ſame time, is ſo far from diſclaiming, that he glories in the name of a follower of Chriſt.

Upon the whole, in the hiſtorical part of the New Teſtament, we find the word αἱρεσις employed to denote "ſect" or "party," indiſcriminately, whether good or bad. The word "ſect," however, among the Jews, was not, in its application, entirely coincident with the ſame term as applied by Chriſtians to the ſub-diviſions ſubſiſting among themſelves. We ſeem invariably to uſe it of thoſe who form ſeparate communions, and who do not aſſociate with one another in religious worſhip and ceremonies. Thus we call Papiſts, Lutherans, Calviniſts, different ſects, not ſo much on account of their difference in opinion, as becauſe they have eſtabliſhed for themſelves different fraternities, to which, in what regards public worſhip, they confine themſelves; the ſeveral denominations above-mentioned having no intercommunity with one another in ſacred matters. High church and low church we call only parties, becauſe they have not formed ſeparate communions.

In the Jewiſh ſects (if we except the Samaritans) there were no ſeparate communities erected. The ſame temple, and the ſame ſynagogues, were attended alike by Phariſees and by Sadducees. Nay, there were often of both denominations in the Sanhedrim, and even in the prieſthood.

Another

Another difference was, that the name of the ſect was not applied to all the people who adopted the ſame opinions, but ſolely to the men of eminence among them, who were conſidered as the leaders and inſtructors of the party. This is exemplified in the uſe of the appellation Phariſees, which was uſed in ſcripture and alſo by Joſephus, to denote, not the followers, but the leaders of the Phariſees. The caſe was ſomewhat otherwiſe with regard to the Eſſenes; for they entered into a ſolemn engagement, by which they confined themſelves to a peculiar mode of life, that ſecluded them from the reſt of mankind; and they may therefore be conſidered almoſt in the ſame manner as we do the Benedictines or Dominicans, or any order of monks or friars among the Romaniſts.

It has been ſuggeſted, that the acceptation of the word αἵρεσις in the Epiſtles, is different from what it has been obſerved to be in the hiſtorical books of the New Teſtament. In order to account for this difference, we may obſerve, that the word "ſect" has always ſomething relative in it; and therefore, in different applications, though the general import of the term be the ſame, it will convey a favourable or an unfavourable idea, according to the particular relation it bears. When the word "ſect" is uſed along with the proper name, by way of diſtinguiſhing one party from another, it conveys neither praiſe nor blame. Thus we read of the ſect of the Phariſees, the ſect of the Sadducees, the ſect of the Nazarenes; and thus we may ſpeak of a ſtrict ſect, or a lax ſect, or even of a good ſect, or a bad ſect. If any thing reprehenſible or commendable be ſuggeſted, it is ſuggeſted, not by the word αἵρεσις, but by the words conſtrued with it. Again, it may be applied to a formed party in a community, conſidered in reference to the whole. If the community, of which the ſect is a party, be of ſuch a nature as not to admit this ſub-diviſion, without impairing and corrupting its conſtitution, to charge them with ſplitting into ſects or forming parties, is to charge them with corruption, in what is moſt eſſential to them as a ſociety. Hence ariſes the whole difference in the word, as it is uſed in the hiſtory, and as it is uſed in the epiſtles of Peter and Paul; for theſe are the only apoſtles who employ it. In the hiſtory, the reference is always of the firſt kind; in the epiſtles, always of the ſecond. In theſe the apoſtles addreſs themſelves only to Chriſtians, and are not ſpeaking of ſects without the church, but either reprehending men for, or warning them againſt, forming ſects among themſelves, to the prejudice of charity, to the production of much miſchief within their community, and of great ſcandal to the unconverted world without. So St. Paul's words to the Corinthians (1 Cor. xi. 19.) were underſtood by Chryſoſtom, and other ancient expoſitors. In both applications, however, the radical import of the word is the ſame; but even here, it has no neceſſary reference to doctrine, true or falſe. Campbell's Preliminary Diſſertations to the "Four Goſpels, &c." Saicer's Theſ. vol. i. p. 120. 124. Lardner's Works, vol. ix. p. 223, &c. For the difference between *hereſy* and *ſchiſm*, ſee the latter article. See alſo Heretic.

It ſeems difficult in the law of England, preciſely to determine what errors amount to hereſy, and what not. Sir Matthew Hale, (1 Hal. P. C. 384) defines it to be "Sententia rerum divinarum humano ſenſu excogitata, palam docta et pertinaciter defenſa." But, ſays judge Blackſtone, here it muſt be acknowledged, that particular modes of belief or unbelief, not tending to overturn Chriſtianity itſelf, or to ſap the foundations of morality, are by no means the object of coercion by the civil magiſtrate. Others, however, contend for a greater latitude on this ſubject than the learned judge allows; and they conceive, that opinions relating to religion, and more particularly the tendency of ſuch opinions, do not lie within the province of the civil magiſtrate, whoſe buſineſs it is to guard againſt the pernicious influence of overt acts, that diſturb the peace and undermine the ſecurity and exiſtence of the ſtate over which he preſides. Indeed, what doctrines ſhould be adjudged hereſy, was left, by our old conſtitution, to the determination of the eccleſiaſtical judge, who had, in this reſpect, a moſt arbitrary latitude allowed him. For the general definition of an heretic given by Lyndewode (cap. de hæreticis) extends to the ſmalleſt deviations from the doctrines of holy church: "hæreticus eſt qui dubitat de fide Catholica, et qui negligit ſervare ea, quæ Romana eccleſia ſtatuit, ſeu ſervare decreverat." Or, as the ſtatute 2 Hen. IV. c. 15. expreſſes it in Engliſh, "teachers of erroneous opinions, contrary to the faith and bleſſed determinations of the holy church." Very contrary this, to the uſage of the firſt general councils, which defined all heretical doctrines with the utmoſt preciſion and exactneſs. And what ought to have alleviated the puniſhment, the uncertainty of the crime, ſeems to have enhanced it in thoſe days of blind zeal and pious cruelty. The ſanctimonious hypocriſy of the canoniſts at firſt, indeed, went no farther than enjoining penance, excommunication, and eccleſiaſtical deprivation for hereſy; though afterwards they proceeded boldly to impriſonment by the ordinary, and confiſcation of goods in *pios uſus*. But in the mean time they had prevailed upon the weakneſs of bigotted princes to make the civil power ſubſervient to their purpoſes, by making hereſy not only a temporal, but even a capital, offence; the Romiſh eccleſiaſtics determining, without appeal, whatever they pleaſed to be hereſy, and ſhifting off to the ſecular arm the odium and drudgery of executions; with which they themſelves were too tender and delicate to intermeddle. Nay, they pretended to intercede and pray on behalf of the convicted heretic, "ut citra mortis periculum ſententia circa eam moderatur;" well knowing, at the ſame time, that they were delivering the unhappy victim to certain death. Hence the capital puniſhments on the ancient Donatiſts and Manichæans by the emperors Theodoſius and Juſtinian (Cod. l. i. tit. 5.); hence alſo the conſtitution of the emperor Frederic, mentioned by Lyndewode, adjudging all perſons, without diſtinction, to be burnt with fire, who were convicted of hereſy by the eccleſiaſtical judge. The ſame emperor, in another conſtitution, ordained, that if any temporal lord, when admoniſhed by the church, ſhould neglect to clear his territories of heretics, within a year, it ſhould be lawful for good Catholics to ſeize and occupy the lands, and utterly to exterminate the heretical poſſeſſors. And upon this foundation was built that arbitrary power, ſo long claimed and ſo fatally exerted by the pope, of diſpoſing even of the kingdoms of refractory princes to more dutiful ſons of the church. Whilſt Chriſtianity was thus deformed by the dæmon of perſecution on the continent, it was not likely that our own iſland ſhould altogether eſcape the ſame ſcourge. We therefore find among our ancient precedents (F. N. B. 269.) a writ "de hæretico comburendo," which is thought by ſome to be as ancient as the common law itſelf. The conviction of hereſy, however, by the common law, was not in any petty eccleſiaſtical court, but before the archbiſhop himſelf in a provincial ſynod, and the delinquent was delivered over to the king to do as he ſhould pleaſe with him; ſo that the crown had a controul over the ſpiritual power, and might pardon the convict by iſſuing no proceſs againſt him; the writ "de hæretico comburendo" being not a writ

a writ of courſe, but iſſuing only by the ſpecial direction of the king in council. (1 Hal. P. C. 395.) But in the reign of Henry IV., the clergy, availing themſelves of the king's dubious title for an increaſe of their own power, obtained an act of parliament, 2 Hen. IV. c. 15. by virtue of which the dioceſan alone, without the intervention of a ſynod, might convict of heretical tenets; and unleſs the convict abjured his opinions, or if, after abjuration, he relapſed, the ſheriff was bound, "ex officio," if required by the biſhop, to commit the unhappy victim to the flames, without waiting for the conſent of the crown. Afterwards, when the final reformation of religion began to advance, the power of the eccleſiaſtics was ſomewhat moderated; for though what hereſy *is*, was not then preciſely defined, yet we are told in ſome points what it is *not*; thus the ſtatute 25 Hen. VIII. cap. 14. declared, that offences againſt the ſee of Rome are not hereſy, and the ordinary is reſtrained from proceeding upon mere ſuſpicion, *i. e.* unleſs the party be accuſed by two credible witneſſes, or an indictment of hereſy be firſt previouſly found in the king's courts of common law; yet in ſix years afterwards, the ſtat. 31 Hen. VIII. cap. 14. eſtabliſhed the ſix moſt contested points of popery, *viz.* tranſubſtantiation, communion in one kind, the celibacy of the clergy, monaſtic vows, the ſacrifice of the maſs, and auricular confeſſion; and farther enacted and declared all oppugners of the firſt to be heretics, and to be burnt with fire; and of the five laſt to be felons, and to ſuffer death. By ſtat. 1 Eliz. cap. 1. all former ſtatutes relating to hereſy are repealed, which leaves the juriſdiction of hereſy as it ſtood at common law, *viz.* as to the inflictions of common cenſures in the eccleſiaſtical courts; and, in caſe of burning the heretic, in the provincial ſynod only (5 Rep. 23. 12 Rep. 56. 92.); or, according to ſir Matthew Hale, in the dioceſan alſo; but in either caſe the writ is not demandable of common right, but grantable or otherwiſe, merely at the king's diſcretion. 1 Hal. P. C. 405. (See *De* HÆRETICO *Comburendo.*) By this ſtatute the term hereſy is reſtrained to ſuch tenets as are either determinable by the words of the canonical ſcripture, or by one of the four firſt general councils, or by ſome other council which has only uſed the expreſs words of ſcripture, or by parliament, with the aſſent of the convocation.

It is agreed that the convocation may, and always might, declare what opinions are heretical, and that a conviction before them was anciently a good foundation for the writ *De Hæretico Comburendo*; but it is doubted whether they can, at this day, convene and convict a heretic. A biſhop, but no other ſpiritual judge, may puniſh a heretic by church cenſures; and a conviction before him was, as ſome ſay, anciently a good foundation for the writ *De Hæretico Comburendo.* But the temporal courts cannot puniſh a heretic, as ſuch, but only as a diſturber of the public peace; yet ſuch courts may incidentally take knowledge whether a tenet be heretical or not; as anciently, where biſhops grounded their commitment of a man as an heretic on 2 Hen. IV. which empowered them to impriſon for hereſy; or even at this day, where a biſhop pleads to a *quare impedit*, that he refuſed the clerk for hereſy; in both which caſes the temporal courts will relieve the party, unleſs the particular point charged againſt him be ſet forth, and ſuch point appear to be heretical. But regularly, the temporal courts cannot determine what is hereſy; and therefore if a man thinks himſelf aggrieved by a ſuit in the ſpiritual court *pro ſalute animæ*, for hereſy, his moſt proper remedy is by appeal, not prohibition. Anciently, an heretic convict, refuſing to abjure, or relapſing after abjuration, might be burnt by force of the writ *De Hæretico Comburendo*; but he forfeited neither lands nor goods: but though this writ is now aboliſhed, and all the old ſtatutes which gave a power to arreſt or impriſon perſons for hereſy, or introduced any forfeiture on that account, are repealed; yet by the common law, ſtill in force, an obſtinate heretic may be impriſoned by force of the writ *De Excommunicato Capiendo*, till he make ſatisfaction to the church. The civil magiſtrate has ſtill a power of interpoſing with regard to one ſpecies of hereſy; for, by ſtat. 9 and 10 Will. III. cap. 32. if any perſon, educated in the Chriſtian religion, and having made profeſſion of the ſame, ſhall by writing, printing, teaching, or adviſed ſpeaking, deny the Chriſtian religion to be true, or the holy ſcriptures to be of divine authority, or deny any one of the perſons in the holy Trinity to be God, or maintain that there are more Gods than one, he ſhall for the firſt offence be rendered incapable of holding any office or place of truſt; and for the ſecond, be rendered incapable of bringing any action, being guardian, executor, legatee, or purchaſer of lands, and ſhall ſuffer three years impriſonment without bail. But if, within four months after the firſt conviction, the delinquent will, in open court, publicly renounce his error, he is diſcharged at once from all diſabilities. It is the wiſh of many, however, that in an age of unreſtricted inquiry, and in a country that may juſtly boaſt of the prevalence of knowledge, and liberality of ſentiment, our ſtatute books may be reſcued from the opprobrium of penal laws in the province of religion.

HERESY is ſometimes alſo uſed, by extenſion, for a propoſition that is notoriouſly falſe in ſome other ſcience.

Thus it is a hereſy in morals to ſay, that a man muſt be ungrateful. It is a hereſy in geometry to ſay, that two triangles, whoſe angles are equal, are not ſimilar.

HERETIC, in a general ſenſe, is one that ſets up to be the head, or chuſes to join himſelf to a particular religious ſect.

Heretic, in a bad ſenſe, according to the opinion of Whitby, Foſter, and many others, is one who knowingly eſpouſes a falſe doctrine, is inſincere in his profeſſion, and aſſerts and defends what he is convinced is contrary to Chriſtianity, and conſequently ſupports the intereſt of a faction, in order to ſerve ſome bad deſigns. According to this opinion, a heretic not only entertains wrong ſentiments of Chriſtianity, but doth this wilfully, and with an ill intention; ſo that no mere error of the judgment can be hereſy, and no honeſt man, who is not condemned of himſelf, can poſſibly be a heretic. Thoſe who are of this opinion, and particularly Dr. Foſter, in his controverſy with Dr Stebbing, infers from the above ſtatement of the apoſtle's ſenſe of the term heretic (Tit. iii. 10, 11.), who is ſaid to be *ſelf-condemned* (αὐτοκατάκριτος), that as none can ordinarily tell who is *ſelf-condemned* without the gift of diſcerning ſpirits, the uſe of this rule was peculiar to the apoſtle's time. The chief argument in ſupport of this interpretation is, not ſo much that ſuch a perſon is ſaid to *ſin*, but that he is ſaid to be αὐτοκατάκριτος, which is ſuppoſed to ſignify *condemned by his own conſcience.* But Dr. Stebbing thinks the meaning is, that ſuch a perſon does not, like many other offenders, ſtudy to conceal his crime, and thereby oblige others to prove it, but that, openly declaring and maintaining his ſentiments, he is accuſed and condemned out of his own mouth: compare Heb. xi. 7. Matt. xii. 41, 42. Acts, xiii. 46 where perſons are ſaid to be condemned by thoſe who furniſh out matter for their condemnation: compare Job, xv. 6. Luke, xix. 22.

Againſt Dr. Foſter's explanation of the term heretic, Dr. Campbell has urged ſeveral objections, which he con-

ceives

ceives to be insuperable. It is not, he says, agreeable to the rules of criticism to assign, without any evidence from use, a meaning to a concrete term which does not suit the sense of the abstract. Αἵρεσις is the abstract, αἱρετικος the concrete. If αἵρεσις could be shewn, in any instance, to mean the profession and propagation of opinions not believed by him who professes and propagates them, it might be admitted that αἱρετικος might denote the professor or propagator of such opinions. But it is not pretended that αἵρεσις, in any case, scriptural, classical, or ecclesiastical, ever bore that meaning; there is, therefore, a very strong probability against the sense given by Foster, &c. to the word αἱρετικος. Besides, this word, though it occurs but once in scripture, is very common in ancient Christian writers, but has never been said, in any one of them, to bear the meaning which Dr. Foster has affixed to it. Moreover, the apostolical precept explained in this way is of little or no use. Who can know whether a man's belief in the opinions which he professes be sincere or hypocritical? Titus, it may be said, had the gift of discerning spirits, and, therefore, might know. Was the precept, after his life-time, to be of no service in the church? This seems to be incredible, especially as there is no other direction in the chapter, or even in the Epistle, which requires a supernatural gift to enable men to follow it. To what purpose enjoin us to "avoid a heretic," if it be impossible without a miracle to know him? Although we cannot affirm, that such a species of hypocrisy as Foster makes essential to the character has never appeared, it may be presumed, that it very rarely appears. It is the natural tendency of vanity and ambition to make a man exert himself in gaining proselytes to his own notions, however trifling, and however rashly adopted. But it is not a natural effect of this passion to be zealous in promoting opinions which the promoter does not believe, and to the propagation of which he has no previous inducement from interest. It is sufficient to vindicate the application of the term αὐτοκαταχριτος, or *self-condemned*, that a factious or turbulent temper, like any other vicious disposition, can never be attended with peace of mind, but, in spite of all the influence of self-deceit, which is not greater in regard to this than in regard to other vices, must, on account of the mortal wounds it gives to peace and love, often be disquieted by the stings of conscience. In short, the αἱρετικος, when that term is applied to a person professing Christianity, is the man who, either from pride, or from motives of ambition or interest, is led to violate the important precepts of our Lord, recorded Matt. xxiii. 8. 10. We may here observe further, that, in the early ages of the church, after the completion of the canon, the word αἱρετικος was not always limited (as the word *heretic* is in modern use) to those who, under some form or other, profess Christianity. At present, we invariably distinguish the *heretic* from the *infidel*. The first is a corruptor of the Christian doctrine, of which he professes to be a believer and a friend; the second, a declared unbeliever of that doctrine, and, consequently, an enemy; whereas, in the times above referred to, the head of a faction in religion, or in ethics (for the term seems not to have been applied at first to the inferior members), the founder, or at least a principal promoter of a sect or party, whether within or without the church; that is, whether of those who called themselves the disciples of Christ, or of those who openly denied him, was indiscriminately termed *heretic*. For want of duly attending to this difference in the ancient application of the word, it has been confusedly and inconsistently used by ecclesiastical historians. Thus Dositheus, Simon Magus, Menander, and some others, are commonly ranked among the ancient heretics; whereas, they were deniers of Jesus Christ in every sense, and avowed opposers of the gospel. Nevertheless, the primitive writers called them *heretics*; and, therefore, their sense of the word αἱρετικος did not coincide with ours. Upon the whole, we observe, that the heretics, whom, in the New Testament, we are directed to avoid, were not the humble, modest, and peaceable, though erroneous Christians, who adhered to the authority of Christ, and desired to know and do his will; but the proud, pragmatical, turbulent party-men, who disturbed and divided the church by their impositions and innovations, on the terms of brotherly affection and Christian communion, and by assuming an authority over their fellow Christians. Heresy, in the sense of scripture, doth not consist in simple errors; nor were those heretics who were anathematized and persecuted; but only those who anathematized and persecuted others, refusing to acknowledge them for true Christians, on account of their supposed or real mistakes; agreeably to this sense of the appellation, it is observed by Mr. Hallet, that all heretics are sectaries; that no doctrine alone can constitute a person a heretic; and that the pope is the greatest heretic in the world. See Hallet's Notes, &c. vol. iii. disc. ix. p. 390. Furneaux's Letters to Judge Blackstone, p. 30.

A real heretic is properly he who maintains a false opinion, out of a spirit of obstinacy, faction, or hypocrisy. A heretic makes profession of Christianity, by which he is distinguished from an Infidel, Jew, and Idolater.

A man does not become an heretic by doing a thing condemned or forbidden by the Gospel, and of consequence repugnant to the Christian faith; but by a stiff, disingenuous, wilful, turbulent adherence to an opinion opposite to some article of the Christian faith, whether it regard speculation or practice.

Others, however, both in the early ages of the church and in modern times, have extended the odious appellation of heretics to those that have been mistaken in judgment, who have erred in fundamentals, or doctrines reckoned of the greatest importance. See Heresy.

The sects of heretics, who have, at different times, disturbed the church, are innumerable.

The emperor Maximus, who usurped the throne from Gratian, was the first that decreed the pains of death to heretics.

By our own law, heretics were anciently to be burnt; and there was a writ, *De Hæretico Comburendo*, which lay for that purpose.

HERETOCHS, among our *Saxon Ancestors*, signified the same with dukes or *duces*, denoting the commanders or leaders of their armies. See Duke.

It appears, from Edward the Confessor's laws, that the military force of this kingdom was in the hands of the dukes or heretochs, who were constituted through every province and county in the kingdom, being selected out of the principal nobility, and such as were most remarkable for being *sapientes, fideles, & animosi*. Their duty was to lead and regulate the English armies, with a very unlimited power; and because of their great power they were elected by the people in their full assembly, or folkmote, in the same manner as sheriffs were elected.

HERICOURT, Louis de, in *Biography*, a lawyer and man of learning, was born at Soissons in 1687. He applied himself most diligently to the study of the civil law, and in 1712 was appointed advocate in the parliament of Paris. In 1713 he was associated with the writers in the "Journal des Savans," in which his labours were much approved. In 1719 he published a very valuable, and as it proved, a popular

pular work, entitled "Les Loix Eccleſiaſtiques de France, miſes dans leur Ordre Naturel." He was author, likewiſe, of a "Treatiſe on the Sale of Immoveables by decree," an "Abridgment of the Diſcipline of the Church, by P. Thomaſſin," and other pieces. He died in 1753, leaving behind him a high character of the moſt unblemiſhed integrity. His poſthumous works were publiſhed in four volumes, 4to. Moreri.

HERISSON, in *Fortification*, a beam armed with iron ſpikes, the points whereof are turned outward, ſupported in the middle by a ſtake, wherein is a pivot on which it turns; it ſerves as a barrier to block up a paſſage.

Heriſſons are frequently placed before gates, eſpecially the poſterns of a town or fortreſs, to ſecure thoſe paſſages which muſt of neceſſity be frequently opened and ſhut.

HERITAGE. See INHERITANCE.

HERITIER, CHARLES LOUIS L', DE BRUTELLE, in *Biography*, an eminent French botaniſt, one of the moſt diſtinguiſhed ſtudents and promoters of the Linnæan principles and accuracy in his own country, was born, of an opulent mercantile family, at Paris in 1746. In 1772 he was appointed ſuperintendant of the waters and foreſts of the *Generalité* of Paris, and his active mind being turned to fulfil the duties of his office, he began to apply to botany, with a particular view to the knowledge of foreſt-trees. He ſoon extended his enquiries; ſtudied the works of Linnæus; and became one of the moſt zealous diſciples of the illuſtrious Swede, among people who, prepoſſeſſed with French ſyſtems and French importance, could ſcarcely conceive that botany could make any progreſs but at the beck of a Tournefort or a Juſſieu; great names, worthy of better diſciples! No wonder if l'Heritier yielded to a contrary bias. A new path lay open before him, and he purſued it with the ardour natural to his character. His countrymen had ſat down under the fading laurels of Tournefort, and the ſcarcely expanding ones of Bernard de Juſſieu. He directed their attention, if not their homage, to another quarter. If they could not adopt his prejudices, they were aſhamed not to defend their own. The ſtimulus of ambition, the calls of filial piety and patriotiſm, raiſed up another Juſſieu, and the world ſaw, in 1789, the *Genera Plantarum ſecundum Ordines Naturales diſpoſitæ*; a work whoſe publication marks an epocha in philoſophical and ſyſtematic botany, and whoſe merits are the more wonderful, when we conſider that the author had but for a few years paid any deep or conſiderable attention to the ſcience, and, but for the above-mentioned cauſes, might never have cultivated it at all.

When the writer of the preſent article knew theſe able men at Paris in 1786 and 1787, each formed, as it were, the head of a ſchool. Brouſſonet, who had ſtudied with ſir Joſeph Banks, and was an ardent Linnæan, was the intimate friend of l'Héritier, and contributed in no ſmall degree to urge him forward in his career. The firſt fruit of his labours was a ſplendid book, with finely engraved plates, entitled *Stirpes Novæ*, of which the firſt faſciculus, containing eleven plates with their deſcriptions, appeared in 1784. Some copies were coloured for thoſe who choſe to have them, but the author himſelf had a prepoſſeſſion in favour of uncoloured botanical works, from an opinion that painted ones were ſeldom ſufficiently correct to anſwer any good purpoſe. In this we can trace the influence of his friend Brouſſonet, and of the Bankſian ſchool. Contrary ſentiments have ſince prevailed, and it is curious to obſerve how the popular taſte for coloured books in natural hiſtory, has extended the ſame faſhion to the baby library; though, from a compariſon of merits in the execution, ſome future antiquarian critic may be not a little puzzled to decide which were the prototypes, and which the copies. (See *Figures of* PLANTS.) Five more faſciculi of the *Stirpes Novæ* followed, amounting to eighty-four plates and their deſcriptions all together. They were all dated either 1784 or 1785, though many of them not actually publiſhed till ſeveral years afterwards. By this the author gave great offence to the abbé Cavanilles at Madrid, who was at the ſame period publiſhing upon the Monadelphous or Mallow tribe, which fills one of l'Heritier's laſt faſciculi. Some of the labours of the worthy Spaniard ſeemed foreſtalled, and the priority of his names infringed upon. A paper war enſued, in which we cannot but think juſtice was on his ſide, though we are equally certain l'Heritier never borrowed, nor could want to borrow, any thing from him, whoſe knowledge and whoſe performances could, at that period, bear no compariſon with his own, however eſtimable the character and the ſubſequent labours of the indefatigable Cavanilles.

To ſecure to himſelf ſome of his own diſcoveries, and eſpecially the eſtabliſhment of certain new genera and their names, l'Heritier contrived a method of publiſhing ſuch in the form of monographs, with one or two plates; but the purpoſe ſeems imperfectly anſwered, theſe publications not being dated at all. The ſubjects were *Louichea*, *Buchozia*, *Michauxia*, *Hymenopappus*, and *Virgilia*. We have always underſtood that twelve of each were printed. His biographer, the celebrated Cuvier, ſays, there were only five, and that, "in order to give them the value of rarity," by which only ſome collectors judge of books, "he diſtributed the copies gratuitouſly to different people, ſo that no individual might be poſſeſſed of the entire collection." We are however indebted to his favour for the whole ſet complete, which may alſo be ſeen in the rich library of ſir Joſeph Banks. A ſixth diſſertation of the ſame kind on *Kakile* was preparing, but never finiſhed, ſo that one proof copy only was in exiſtence, which was ſold with his library in 1802. The catalogue of this library amounts to 2957 articles. Its poſſeſſor ſpared no pains nor expence to enrich it, and he allowed his friends, and all who had a taſte for the ſame ſtudy, to conſult his collection without reſerve. He even propoſed at one time to dedicate it freely to public uſe, in order to ſhame the government of the day, who were about to render venal all acceſs to the public libraries and collections; and his example had in ſome meaſure the effect of defeating ſo ſcandalous a project.

The neighbourhood and the gardens of Paris were, in his time at leaſt, by far too confined a field for the aſpiring genius of l'Heritier. Prevented by inſurmountable obſtacles from botanizing in remote regions himſelf, he expreſſed, in the preface to his *Stirpes*, a wiſh that ſome traveller might entruſt him with the publication of his diſcoveries. His deſire was not entirely fruitleſs. Dombey returned to Paris in 1786 with the wreck of his vaſt collections made in Chili and Peru, and in vain ſolicited from M. de Calonne the requiſite aſſiſtance to render his diſcoveries of uſe to the public. The miniſter and the government had other things to think of. The horrors of impending bankruptcy, the juſt fear of reformation and revolution, all alike inevitable, left them neither attention nor money to beſtow on ſcience. They allowed their amiable king to fancy he was doing good by patronizing agriculture, and a medal was ſtruck on his giving away milch cows in the neighbourhood of Paris, whilſt a blood-ſucking hydra was draining the vitals of his people, under the maſk of his authority and even of his virtues. We have already related (ſee DOMBEY) how l'Heritier obtained the herbarium of this unfortunate botaniſt, and how his aim was diſappointed. Cuvier ſays, he brought back from England the manuſcript of his Peruvian Flora complete, and that ſixty drawings were finiſhed, and many engraved.

engraved. On this ſubject the writer of the preſent article can give no information, having returned from the continent but a ſhort time before the departure of l'Heritier. He knows, however, that the latter had laboured very aſſiduouſly, and very ſecretly, always in dread of ſome interruption from his government; and that the few ſpecimens he ventured to give his friends here, out of Dombey's collection, were all marked as given by M. de Buffon. He found leiſure, during his ſtay, to collect from the Engliſh gardens the materials of his *Sertum Anglicum*, a work conſiſting of ſeveral faſciculi, on a ſimilar plan to his *Stirpes Novæ*, but it remains unfiniſhed. He alſo publiſhed a monograph on the genus *Cornus*, and the plates of another on the natural family of *Geranía*; ſee that article and ERODIUM. The letter preſs of the latter, though reported to be printed, never appeared. He augmented his library greatly during his viſit to England, and after his return, and for a while lived happy in the boſom of his family, dividing his attention between his ſcientific purſuits, and thoſe public duties of which we are now to ſpeak.

The ſubject of our narrative became a *Conſeiller a la Cour des Aides*, in 1775, and was for a long time the dean of that court, being perſonally attached by various ties to its chief, M. de Maleſherbes, the illuſtrious victim to its duty in the cloſing ſcene of Louis XVI. L'Heritier loved and emulated the auſtere public virtue, the private amiableneſs, and the univerſal benevolence of this great man, while they agreed even in their taſte for botanical amuſements. No wonder that ſuch characters anticipated good from the promiſing dawn of the French revolution! L'Heritier accepted the office of a judge in the civil tribunals of the department of the Seine, and is recorded to have fulfilled its duties with the moſt exemplary rectitude and incorruptibility. He alſo ſat from time to time as a member of the repreſentative body. His views were always thoſe of a true patriot, the correction of abuſes, the maintenance of the laws in their genuine force and purity; and the darling object of his emulation was the uncorrupted Britiſh conſtitution. "In a ſhort time," ſaid he, in 1787 to the writer of this, "we may poſſibly hope to be governed as you are." A few years afterwards he wrote "our elections are now formed on the Engliſh mode; happy if in practice they do not hereafter become too much ſo!"

It is with pain that we advance towards the dreadful catadrophe of his life. He had married, in 1775, an eſtimable woman of the name of Doré, with whom he paſſed 19 years in domeſtic happineſs. She died in 1794, leaving him five children. He devoted himſelf to their education, but with reſpect to one of them, a ſon, his parental ſolicitude was attended with little ſucceſs, and his hopes were blaſted in a cruel manner, by the moſt refractory and unprincipled conduct. The parent returning very late one evening in Auguſt, we believe of the year 1800, from a meeting of the National Inſtitute, never again reached his own domeſtic circle. His children expected him all night long in the greateſt anxiety and uncertainty. Some ſavage cries of inſult or exultation were overheard in the ſilence of the night, but their object was not diſcovered till the dawn of morning, when the murdered body of the father of the family was found near his own threſhold, with the money and other valuables which he carried about him untouched. Nothing certain was ever diſcovered, or at leaſt publiſhed, by the police or government, though the moſt horrible ſuſpicions aroſe, which even in thoſe days of murder and atrocity excited curioſity, if not feeling, in the mind of the Pariſians. "Vague and contradictory conjectures," ſays Cuvier, "aroſe." He declined to repeat them, nor can we throw any freſh light on this diſaſtrous hiſtory. The wretched ſon is now no more. S.

HERITIERA, in *Botany*, ſo named by the late Mr. Dryander, in honour of the able French botaniſt, Charles Louis l'Heritier de Brutelle, whoſe hiſtory is given in the preceding article. As he was, to our knowledge, conſulted about the orthography of the name, and directed that the l' ſhould be dropped, we have thought it beſt to arrange his own biographical article in the ſame part of the alphabet. —Ait. Hort. Kew. v. 3. 546. Schreb. 812. Mart. Mill. Dict. v. 2. (Samadera; Gærtn. t. 156.)—Claſs and order, *Monoecia Monadelphia*. Nat. Ord. *Malvaceæ*, Juſſ.

Gen. Ch. Male flowers ſmaller than the female.—*Cal.* Perianth of one leaf, bell-ſhaped, five-toothed. *Cor.* none. *Stam.* Filament in the centre of the calyx, columnar, conic-awl-ſhaped, encircled below the ſummit with from five to ten minute anthers, united into a cylinder.

Female flowers in the ſame plant, larger.

Cal. as in the male. *Cor.* none. *Stam.* Filament none; anthers ten, ſeated on the receptacle at the baſe of the germens, two between each, didymous, minute, probably barren. *Piſt.* Germens five, half-ovate, compreſſed, ſmooth; ſtyles conical, ſhort, cohering during impregnation; ſtigmas club-ſhaped. *Peric.* Drupas five, widely ſpreading, oval, of one cell; flattiſh above; convex beneath; their keel extended into a wing. *Seeds* ſolitary, large, nearly globular.

Eſſ. Ch. Male, Calyx five-toothed. Corolla none. Filament columnar. Anthers from five to ten, below the top.

Female, Calyx five-toothed. Corolla none. Germens five, ſeſſile, with five pair of barren anthers between them. Drupas five, dry, of one cell. Seeds ſolitary.

1. H. *littoralis*. (Samandara; Herm. Muſ. Zeyl. 5. Linn. Zeyl. 202. Nagám; Rheede Hort. Mal. v. 6. 37. t. 21.)—Native of Ceylon and other iſlands of the Eaſt Indies, in a wet ſandy ſoil, flowering from Auguſt to November, and bearing fruit in March and April. Sir Joſeph Banks procured it for the Kew garden in 1780, where it became known by the name of the Looking-glaſs plant, on account of the ſilvery under ſide of its leaves, ſuggeſting ſome idea of the back of a looking-glaſs. Rheede deſcribes it as a *tree*, of the thickneſs of a man's body, and four times the human height, with a grey bark, and white wood, with reddiſh pith. The *leaves* are evergreen, coriaceous, alternate, ſtalked, a ſpan long, ſomewhat ovate, bluntiſh, and entire; ſmooth and green on the upper ſide; of a ſilvery grey, ſomething like *Hippophäe*, or *Elæagnus*, beneath. *Flowers* ſmall, reddiſh, numerous, in axillary panicles, reſembling thoſe of a *Sterculia*, nor are the fruits of theſe genera diſſimilar in appearance, but the preſent conſiſts, not of burſting follicles, but of a dry cloſe drupa, with one ſeed. The cavity, however, is rather larger than the ſeed, which raiſes a doubt reſpecting the propriety of its denomination.

HERMÆA, Ἑρμαια, in *Antiquity*, a feſtival obſerved in honour of Mercury: yet there were ſeveral ſolemnities of this kind, ſome celebrated in Peloponneſus, others in Bœotia, Crete, &c. See Pott. Archæol. Græc. lib. ii. cap. 20. tom. i. p. 896.

In Crete, during the celebration of the hermæa, the maſters ſerved their ſlaves at table. This cuſtom obtained likewiſe among the Athenians and Babylonians, as alſo among the Romans: witneſs the *Saturnalia*, which ſee.

HERMANN, JAMES, in *Biography*, a Swiſs profeſſor of moral and natural law, who flouriſhed in the 17th and 18th centuries, was born at Baſil in 1678, at the univerſity of which place he ſtudied, and took his degrees. He went through a courſe of divinity, and was admitted into the Chriſtian miniſtry in 1701. He was chiefly attached to mathematical ſtudies, and was one of the moſt diſtinguiſhed

pupils of James Bernouilli. He publiſhed, in 1700, a defence of the principles of the "Differential Calculus," againſt the objections of the famous Nieuwentyt. After he had been admitted to the miniſtry he travelled for improvement through Germany, Holland, France, and England: and on his return to Baſil devoted himſelf with renewed ardour to the mathematical ſciences. In 1707, by the recommendation of Leibnitz, he was appointed profeſſor of mathematics at the univerſity of Padua, the duties of which office he diſcharged, with great reputation, for about ſix years. He next obtained from the king of Pruſſia the mathematical profeſſorſhip at Frankfort on the Oder. In 1724, Peter the Great appointed him mathematical profeſſor at St. Peterſburg, and, in conjunction with M. De Liſle, he was commiſſioned to draw up "An Abridgment of the Mathematics," which was publiſhed in the French language. The departments executed by M. Hermann were thoſe on arithmetic, geometry, trigonometry, and fortification. In 1731 he returned to Baſil, where he was choſen profeſſor of natural and moral law. Upon his quitting St. Peterſburg, the empreſs Anne ſettled on him a conſiderable penſion, upon the condition of his tranſmitting, from time to time, mathematical diſſertations to Peterſburg, for inſertion in the "Memoirs of the Imperial Academy." He lived but a ſhort time to enjoy the favours and honours liberally beſtowed on him, being carried off by a fever in 1733, at the age of fifty-five. His works are very numerous, chiefly on ſubjects connected with mathematics and natural philoſophy. He was elected a foreign member of the Royal Academy of Sciences at Paris. Moreri.

Hermann, Paul, a celebrated botaniſt, was born at Halle, in Saxony, towards the middle of the 17th century. Having reſided ſome time in the Eaſt Indies, and eſpecially at Ceylon, where he practiſed as a phyſician, he was induced to re-viſit Europe in 1679, when an opportunity occurred for him to fill the botanical profeſſorſhip at Leyden, and at the ſame time to undertake the care of the botanical garden eſtabliſhed in that univerſity. Having entered upon his charge, he proſecuted the duties of it with ſo much zeal, that he ſoon more than doubled the number of plants which had been introduced by his predeceſſors during 150 years. Hermann had the honour of being the firſt in Holland who adopted a ſyſtem of botany founded on the fructification, partly following the arrangement of Moriſon, and partly that of Ray. His works are remarkable for the excellence and neatneſs of his figures, containing deſcriptions of many new plants found in various parts of the world. He died on the 29th of January, 1695.—Linnæus, in his *Claſſes Plantarum*, has given a ſketch of the Hermannian ſyſtem, which is founded upon the *Fruit*.—He divided plants, in the firſt place, either from their having naked ſeeds, or ſeeds incloſed in a capſule; he ſub-divided the former according to the number of ſeeds, and the latter according to the number of cells. Having thus begun upon the principle of arranging plants by their fruit, he adhered to the ſyſtem with more pertinacity than either Ray or Moriſon themſelves.—The firſt work he publiſhed was a "Catalogue of the Leyden Garden," in the year 1687, from which it appears, that during the ſeven years of his curatorſhip, he had ſo improved the garden by treaſures, brought both from the Eaſt and Weſt Indies, as well as by the conſtructing of ſtoves, greenhouſes, &c., that it was regarded as the firſt in Holland. Many of theſe new plants were deſcribed and figured by him, particularly ſeveral new and rare Geraniums. This work was reprinted at Leyden in 8vo. in 1720, under the title of "Index Plantarum quæ in horto Leidenſi aluntur," to which Boerhaave added a hiſtory of the garden. To Hermann may be aſcribed, on the authority of Sherard, the following work, *Floræ Lugdunobatavæ flores*, though publiſhed under the name of Zumbach. In this was developed his whole method of claſſification, which Boerhaave nearly followed.—In the year 1695, a work, entitled *Flora Lugdunobatava*, was begun to be printed, but after a few ſheets were taken off, its author's death put a ſtop to any further continuation of it.—At this time the *Paradiſus Batavus* was in a ſtate of forwardneſs, and it was publiſhed in 8vo., as a poſthumous work, about three years afterwards.—It was, however, reprinted in quarto in the year 1705, having been edited by William Sherard, at the expence of Hermann's widow, who is nevertheleſs deſcribed by ſome as an unprincipled woman, unworthy of ſo celebrated a huſband.—Many of the plants are ſcarce ones, or altogether new; ſome are merely named, others beautifully delineated and engraved. A catalogue is ſubjoined, ſhewing what plants the author intended to have given in the following volumes, had he lived to go on with the work.—This indefatigable man left a conſiderable number of papers and dried plants, the latter of which came into the poſſeſſion of J. Burmann, (ſee the article Burmann, J.) and formed the corner-ſtone of his *Theſaurus Zeylanicus*, publiſhed at Amſterdam in 1737. Theſe ſame plants came afterwards into the hands of Linnæus for a time, and from them his *Flora Zeylanica* was compoſed. They are now finally the property of ſir Joſeph Banks.—The ſubject of our memoir paid much attention to the medical qualities of plants, as many of his tracts indicate. Beſides the books above alluded to, he was the author of the following works.

Muſæi Indici catalogus, continens varia exotica animalia, inſecta, vegetabilia, mineralia, quæ collegerat, 1711, 8vo.

Lapis Lydius Materiæ Medicæ, 1704, 8vo.

Muſæum Zeylanicum (unfiniſhed).

Catalogus Plantarum Capitis Bonæ Spei (unedited).

Beſides this liſt, he wrote various botanical and medical tracts which are of leſs moment, and ſome of which are ſuperſeded by the former. Haller's Bibl. Bot. Linnæi Claſſes Plantarum. Moreri Dict.

HERMANNIA, in *Botany*, ſo named by Tournefort, in honour of his learned contemporary and correſpondent, Paul Hermann, M D. who ſent him the original ſpecies, Linnæus's *H. hyſſopifolia*.—Tourn. Inſt. 656. t. 432. Linn. Gen. 348. Schreb. 453. Willd. Sp. Pl. v. 3. 589. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 411. Thunb. Prodr. 110. Juſſ. 289. Lamarck. Illuſtr. t. 570. Cavan. Diſſ. 327. Gærtn. t. 112.—Claſs and order, *Monadelphia Pentandria*. Nat. Ord. *Columniferæ*, Linn. *Tiliaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, inferior, permanent, roundiſh, inflated, five-cleft, its ſegments inflexed. *Cor.* of five petals, rolled ſpirally contrary to the ſun; their claws the length of the calyx, bordered at each ſide with a little membrane, whole edge meets with the oppoſite one of the ſame claw, ſo as to form a nectariferous tube; limb ſpreading, broadiſh, obtuſe. *Stam.* Filaments five, broadiſh, very ſlightly united together in their lower part; anthers erect, pointed, cohering. *Piſt.* Germen ſuperior, roundiſh, with five ſides and five angles; ſtyles five, thread-ſhaped, cloſe together, tapering, longer than the ſtamens; ſtigmas ſimple. *Peric.* Capſule roundiſh, five-ſided, of five cells, opening at the top. *Seeds* numerous, ſmall.

Eſſ. Ch. Calyx ſimple, five-cleft. Petals five, oblique, partly tubular at their baſe. Filaments lanceolate. Styles five. Capſule of five cells, with many ſeeds.

Linnæus, who, to the original one, adds five ſpecies, in his *Hortus Cliffortianus*, the laſt of which indeed is now *Mahernia pinnata*, juſtly notices the great propriety of dedicating a genus, peculiar to the Cape of Good Hope, to a man,

man, who, by the fine African plants with which he enriched the gardens of Holland, revived a taſte for botany in that country, that has ever ſince been continued. Numerous ſpecies of *Hermannia* have ſubſequently been diſcovered, all from the ſame prolific region. The laſt edition of the Linnæan Syſtemata, by Murray, comprehends 17; Willdenow has 30. There is a perpetual ambiguity betwixt this genus and *Mahernia*, of which latter Willdenow reckons up eight ſpecies.—Thunberg, who unites the two genera, has but 27 in all.

We ſhall ſubjoin a few examples of *Hermanniæ*.

H. *althæifolia*. Linn. Sp. Pl. 941. Curt. Mag. t. 307. Cavan. Diſſ. t. 179. f. 2. (H. aurea; Jacq. Hort. Schonbr. v. 2. 46. t. 214. Ketmia africana fruteſcens, foliis mollibus et incanis, flore ſpirali ſulphureo; Commel. Hort. v. 2. 157. t. 79.)—Leaves ovate, crenate, plaited, downy. Lower ſtipulas ovate; upper elongated. Calyx bell-ſhaped, angular. —This, like all the reſt, as we have ſaid, is a native of the Cape, and is very common in green-houſes, where it is remarkable for the velvet ſoftneſs of its *leaves*, like that of the Marſh-mallow, and its numerous drooping *flowers*, whoſe orange petals are contraſted with their rough yellowiſh calyx.

H. *plicata*. Ait. Hort. Kew. n. 2. (H. althæifolia; Jacq. Hort. Schonbr. v. 2. 46. t. 213.)—Leaves ovate, ſomewhat heart-ſhaped, toothed, plaited, rugged, rough. Stipulas ovate, acute, three-ribbed.—Often confounded with the firſt, but its *leaves* are larger, greener, and rather hairy than downy. The *ſtipulas* are broad, often three-cleft. Mr. Maſſon ſent it to Kew, among other things collected by him at the Cape, in 1774.

H. *alnifolia*. Linn. Sp. Pl. 942. Curt. Mag. t. 299. Jacq. Hort. Schonbr. v. 3. 22. t. 291. Mill. Illuſtr. t. 56. —Leaves obovate, ſomewhat wedge-ſhaped, abrupt, emarginate, toothed. Cluſters terminal, compound; their ſtalks about three-flowered.—One of the moſt common and oldeſt of our cultivated ſpecies, often miſtaken, as Mr. Curtis juſtly remarked, for the *groſſularifolia* of Linnæus. It differs from the two former in its ſmaller, paler, and more cluſtered *flowers*. The *leaves* are nearly naked above; white and downy beneath.

H. *flammea*. Jacq. Hort. Schonbr. v. 1. 69. t. 129. Willd. n. 17.—Leaves wedge-ſhaped, abrupt, ſmooth; toothed at the extremity. Cluſters terminal; their ſtalks two-flowered. Calyx widely-ſpreading.—This is happily named from the flame-coloured *flowers*, whoſe petals are ſtriped with deep orange and yellow. We have not ſeen it in England.

H. *lavandulifolia*. Linn. Sp. Pl. 942. Curt. Mag. t. 304. Cavan. Diſſ. t. 180. f. 1. Jacq. Hort. Schonbr. v. 2. 46. t. 215.—Leaves elliptic-lanceolate, obtuſe, entire, downy. Stipulas linear. Calyx angular.—This was in the Eltham garden before 1732, and is now very common. The *leaves* are pale and very ſoft. *Flowers* pendulous, orange-coloured, produced frequently, and in conſiderable plenty.

H. *argentea*.—Leaves doubly pinnatifid, clothed with ſilvery ſtarry ſcales; their ſegments decurrent. Flower-ſtalks ſomewhat racemoſe, elongated, ſingle-flowered.—We know this merely by an indifferent ſpecimen, given us, from the Leyden garden in 1776, by profeſſor David Van Royen, nor can we meet with any account of it. The *leaves* convey ſome idea of *Lavandula multifida*, but are ſmaller, clothed with moſt beautiful ſilvery ſtarry hairs or ſcales. The *flowers* are large, and variegated with orange and yellow. Their *calyx* is ſhort and bell-ſhaped.

HERMANNUS CONTRACTUS, in *Biography*, a learned and pious count and monk of Suabia, to whom are aſcribed the two celebrated hymns in the Romiſh church, "Salve Regina," and "Alma Redemptoris." He had the reputation of great learning, and knowledge of hiſtory, and of the arts and ſciences. He left behind him a Chronicle, a treatiſe on Muſic, in two parts, and a tract on the Monochord. He died at Aleſhuſen in 1054. He was a monk of St. Gal, and had the cognomen of *Contractus*, from a general contraction in all his limbs.

HERMAPHRODITE, Ἑρμαφρόδιτος, a perſon who has both the ſexes, or the genital parts both of male and female.

The word is formed of the Greek Ἑρμαφρόδιτος, a compound of Ἑρμῆς, *Mercury*, and Ἀφροδίτη, *Venus*; *q. d.* a mixture of Mercury and Venus, *i. e.* of male and female. For it is to be obſerved, Hermaphroditus was originally a proper name, applied by the heathen mythologiſts to a fabulous deity, whom ſome repreſent as a ſon of *Hermes*, *Mercury*, and *Aphrodite*, *Venus*; and who, being deſperately in love with the nymph Salmacis, obtained of the gods to have his body and her's united into one. Others ſuggeſt, that the god Hermaphroditus was a compoſition of Mercury and Venus, thus exhibiting the union of eloquence or of commerce, repreſented by Mercury, with Pleaſure or Venus. Others think this junction intended to ſhew, that Venus, Pleaſure, was of both ſexes; as, in effect, the poet Calvus calls Venus a god.

M. Spon obſerves, Heſychius calls Venus *Aphroditos*: and Theophraſtus affirms, that Aphroditos, or Venus, is Hermaphroditus; and that, in the iſland of Cyprus, ſhe has a ſtatue, which repreſents her with a beard like a man. The Greeks alſo call *hermaphrodites* ἀνδρόγυνοι, *androgyni*, *q. d. men-women*.

Mr. Hunter, in his account of the free martin, has lately obſerved, that, in many of the inferior tribes of animals, the male and female parts of generation are found to be united in the ſame animal, which, from poſſeſſing both parts, are called hermaphrodite. Theſe hermaphrodites he divides into the natural and unnatural, or monſtrous. The natural kind belongs to the inferior and more ſimple order of animals; but as animals become more complicated, and each part is more confined to its particular uſe, a ſeparation of the two neceſſary powers for generation takes place in them: and he apprehends that the unnatural kind may be occaſionally found among every tribe of animals having diſtinct ſexes, but that it is more common in ſome than in others. The human ſpecies has the feweſt; but in the horſe, aſs, ſheep, and cattle, they are very frequent. Phil. Tranſ. vol. lxix. part i. p. 279, &c. See *Free* MARTIN. On the ſubject of hermaphrodites, ſee *Hermaphroditiſm* under the article GENERATION.

Divers of the inſect and reptile kind are truly hermaphrodites; particularly worms, ſnails, &c.

In the Memoirs of the French Academy, we have an account of this very extraordinary kind of hermaphrodites, which not only have both ſexes, but do the office of both at the ſame time. Such are earth-worms, round-tailed worms found in the inteſtines of men and horſes, land-ſnails, and thoſe of freſh waters, and all the ſorts of leeches. And as all theſe are reptiles, and without bones, M. Poupart concludes it probable, that all other inſects, which have theſe two characters, are alſo hermaphrodites.

The method of coupling, practiſed in this claſs of hermaphrodites, may be illuſtrated in the inſtance of earth-worms. (Ray's Hiſt. Inſect. p. 2.) Theſe little creatures creep, two by two, out of holes proper to receive them, where they diſpoſe their bodies in ſuch a manner, as that the head of the one is turned to the tail of the other. Being thus ſtretched lengthwiſe, a little conical button or papilla is thruſt forth by each, and received into an aperture of the other.

Theſe

Theſe animals, being male in one part of the body and female in another, and the body flexible withal, M. Homberg does not think it impoſſible but that an earth-worm may couple with itſelf, and be both father and mother of its young; an obſervation which, to ſome, appears highly extravagant!

Among the inſects of the ſoft or boneleſs kind, there are great numbers indeed which are ſo far from being hermaphrodites, that they are of no ſex at all. Of this kind are all the caterpillars, maggots, and worms, produced of the eggs of flies of all kinds; but the reaſon of this is plain; theſe are not animals in a perfect ſtate, but diſguiſes under which animals lurk. They have no buſineſs with the propagating of their ſpecies, but are to be transformed into animals of another kind, by the putting off their ſeveral coverings, and then only they are in their perfect ſtate, and therefore then only ſhew the differences of ſex, which are always in the diſtinct animals, each being only male or female. Theſe copulate, and their eggs produce theſe creatures, which ſhew no ſex till they arrive at that perfect ſtate again. Mem. Acad. Par. 1707.

Hermaphrodite, a term frequently applied to a large ſort of waggon in ſome diſtricts, which is capable of being divided, ſo as to conſtitute two carts. See Waggon.

HERMAPOLLON, in *Antiquity*, a ſtatue or figure compoſed of Mercury and Apollo, repreſenting a young man with the ſymbols of both divinities, *viz.* the petaſus and caduceus, with the bow and lyre.

HERMAS, in *Biography*, the author of an ancient book, called the "Shepherd or Paſtor," quoted by Irenæus, Clement of Alexandria, Origen, Tertullian, and others. It was written in Greek at or near Rome, probably about the year 92, a little before Domitian's perſecution. We have only a Latin verſion in three books; containing four viſions, twelve commands, and ten ſimilitudes. In this book, which was held in high eſtimation by the ancient fathers, there are many alluſions to our genuine books of the New Teſtament, though they are not expreſsly cited; but there are none to any apocryphal goſpels or other apocryphal books of the New Teſtament. The beſt edition of the Latin verſion is that of 1698, among the apoſtolical fathers, illuſtrated with the notes and corrections of Cotelerius and Le Clerc, tranſlated by archbiſhop Wake. The beſt edition is that of 1710. Lardner's Works, vol. ii.

Hermas, in *Botany*, a name of whoſe meaning its author Linnæus has left no account. The plant can have nothing to do with Ἑρμῆς, *Mercury*. Profeſſor Martyn ſuggeſts that the word may be derived from ἕρμα, *a prop*, or *foundation*; but its application here is not evident.—Linn. Mant. 163. Schreb. 734. Mart. Mill. Dict. v. 2. Juſſ. 225. Lamarck. Illuſtr. t. 851. Gærtn. t. 85. Claſs and order, *Polygamia Monoecia*, Linn. (rather *Pentandria Digynia*.) Nat. Ord. *Umbelliferæ*.

Gen. Ch. *General umbel* of numerous rays, hemiſpherical; partial of numerous rays, the central one only bearing a flower, the reſt nearly or entirely ſterile. *General involucrum* of numerous, lanceolate, ſhort, permanent leaves; *partial* of about two lanceolate ones, as long as the umbel. *Perianth* obſolete, of five teeth. *Cor. Univerſal* uniform; *partial* of five oblong-ovate, erect, flat, undivided, equal petals. *Stam.* Filaments five, thread-ſhaped, ſhorter than the petals; anthers oblong, ſaid by Linnæus to be empty and ineffectual. *Piſt.* Germen inferior, compreſſed, larger than the corolla; ſtyles two, thread-ſhaped, erect, longer than the corolla; ſtigmas obtuſe. *Peric.* Fruit orbicular, emarginate at the baſe, ſeparating at the angles. *Seeds* two, orbicular, ſomewhat heart-ſhaped, compreſſed nearly flat, bordered, marked with one longitudinal elevated line.

Such are the terminal umbels. The lateral ones are ſmaller and later, entirely male; their partial rays all bearing flowers, whoſe involucrum, perianth, and corolla are like the former. *Stam.* Filaments five, thread-ſhaped, the length of the petals; anthers oval, ſomewhat didymous, perfect. The umbelliferous tribe being, in various inſtances, liable to partial imperfection of the ſexual organs, we conceive there is no more propriety in removing this genus from the bulk of that order in the *Pentandria Digynia*, than there would be in taking away ſome other genera or ſpecies. We ſhall therefore give its eſſential character with a view to its place there, near *Aſtrantia*. The younger Linnæus thought it ſcarcely diſtinct from *Bupleurum*, and Thunberg has united the two.

Eſſ. Ch. Partial involucrum of about two narrow leaves. Terminal umbels fertile; lateral ones male only.

1. H. *depauperata*. Linn. Mant. 299. (Bupleurum villoſum; Linn. Sp. Pl. 343. Thunb. Prodr. 50. Perfoliata foliis oblongis ſinuoſis ſubtùs incanis; Burm. Afric. 196. t. 71. f. 2.)—Leaves nearly ſeſſile, heart-ſhaped-oblong, toothed; ſmooth and ſhining above; downy beneath.—Native of the Cape of Good Hope, as are all the following ſpecies. The *ſtem* is thick and ſomewhat woody, though, as far as we can judge, ſhort and not much elevated. *Leaves* crowded, rigid, two or three inches long and one broad, ovate or oblong, heart-ſhaped at the baſe, with very ſhort broad footſtalks; their margin ſharply toothed, reflexed between the teeth; their upper ſurface ſmooth and ſhining, reticulated with depreſſed veins; the under white and denſely cottony, with prominent veins and rib. Flowering *branches* central, ſolitary, a foot or more in length, round, furrowed, bearing a few ſcattered, ſometimes leafy, ſmall *braſteas*, and one large terminal *umbel*, with two or three alternate, ſmaller, ſtalked lateral ones. The *flowers* are white or yellowiſh. The habit is ſufficiently peculiar, added to the ſhape of the petals, fruit, and other characters recorded in the above generic deſcription, to keep this ſpecies, and ſtill more the ſubſequent ones, diſtinct from *Bupleurum*.

2. H. *gigantea*. Linn. Suppl. 435.—Leaves ſtalked, elliptic-oblong, woolly on both ſides, nearly entire.—Native of the higheſt mountains at the Cape. Much larger than the firſt ſpecies, the *leaves* being above a foot long, not unlike thoſe of the Norfolk Mullein, *Verbaſcum pulverulentum*; their wool when ſcraped off ſerving for tinder. Their edges are ſlightly crenate or wavy. Flowering *branch* two or three feet high, ſmooth, with a large terminal *umbel*, and four or five lateral ones.

3. H. *capitata*. Linn. Suppl. 435.—Leaves radical, ovate, deeply crenate, woolly beneath, longer than their footſtalks. Stalk woolly, leafleſs.—A ſmall herbaceous ſpecies, with the habit of an *Aſtrantia*. *Leaves* all radical, ſcarcely an inch long, not very unlike thoſe of *Dryas octopetala*, their upper ſurface green and quite naked, except a woolline's at the bottom part of the mid-rib; the under is clothed with denſe white down; the edge deeply and acutely crenate. *Footſtalks* woolly, longer than the leaves. *Flower-ſtalk* about a foot high, ſolitary, ſlender, woolly; its terminal fertile *umbel* ſcarcely an inch broad; the one or two lateral ones not much ſmaller. The *leaves* of the general involucrum are elliptical, purpliſh, ribbed, with a very blunt point.

4. H. *quinquedentata*. Linn. Suppl. 436.—Stalk ſmooth. Leaves ovate, five-toothed, downy beneath.—Said in the *Supplementum* to be very diſtinct, on account of its ſmall *leaves*, which have exactly five deep ſerratures each. The *umbel* is there ſaid to be ſolitary, but this muſt be preſumed a miſtake, eſpecially as Thunberg does not repeat the circumſtance in his *Prodromus*.

5. H.

5. H. *ciliata*. Linn. Suppl. 436.—Stalk ſmooth. Leaves ovate, ciliated, downy beneath.—The *umbels* of this are ſaid to be ſeveral, but it is manifeſt that this is only the common character of the genus. We know neither of theſe two laſt, but by the above characters, communicated to the younger Linnæus by their finder Thunberg.

HERMATHENA, Ἑρμαθηνα, in *Antiquity*, a ſtatue repreſenting Mercury and Minerva both in one.

The word is compound of *Hermes*, *Mercury*, and *Athena*, a Greek name for *Minerva*.

M. Spon gives divers figures of Hermathenæ, in his Rech. Cur. de l'Antiquité, p. 98. They are a ſort of ſtatues raiſed on ſquare pedeſtals, after the manner of Hermæ, only that the attributes of Minerva are added thereto. See HERMES below.

HERMATHIAS, a dactylic air. (See HARMATIAN AIR.) Dactylic is a name given, in *Ancient Muſic*, to that kind of air or nome of which the rhythm or meaſure conſiſts of two equal notes. See RHYTHM.

They alſo called a nome dactylic in which this rhythm was frequently uſed, as the Harmathian, and the Orthian nome.

Julius Pollux doubts whether dactylic implied the ſort of inſtrument, or the form of melody; a doubt which is ſolved by what Ariſtides Quintilianus ſays in his ſecond book, and which can only be underſtood, by ſuppoſing that the term *dactylic* ſignifies at once the inſtrument and the air; as with us, ſays Rouſſeau, the words *muſette* and *tambourine*.

HERMAUT, in *Geography*, a town of France, in the department of the Puy-de-Dôme, and chief place of a canton, in the diſtrict of Riom; 8 miles W. S.W. of Riom. The place contains 542, and the canton 3825 inhabitants, on a territory of 147⅓ kiliometres, in ſix communes.

HERMENSDORF, a town of Pruſſia, in the province of Oberland; 10 miles E. of Holland.

HERMENSTADT, or SZEBENY, the capital of Tranſylvania, fortified with a double wall and deep moat, and ſituated on the ſide of the Szeben, which ſoon after runs into the Aluta; 147 miles N. E. of Belgrade. N. lat. 46°. E. long. 23° 50′.

HERMERACLES, in *Antiquity*, a ſtatue compounded of the figures of Mercury and Hercules.

M. Spon gives us a type of an Hermeracles, Rech. Cur. de l'Antiq. p. 96. fig. 13. The name, he obſerves, was given to a divinity repreſented after the manner of Hermes, with the additional attributes of Hercules, *viz.* a lion's ſkin and a club. This he aſcribes to the cuſtom among the Greeks of placing the ſtatues of Mercury and Hercules in the academy and gymnaſia, as both one and the other preſided over the exerciſes of the youth.

HERMEROS, compoſed of Ἑρμης, *Mercury*, and Ἐρως, *Cupid*, a ſtatue formed of Mercury and Cupid.

HERMES, or HERMA, among *Antiquaries*, a ſort of ſquare or cubical figure of the god Mercury, uſually made of marble, though ſometimes of braſs or other materials, without arms or legs, and planted by the Greeks and Romans in their croſs-ways.

Servius gives us the original thereof, in his Comment on the eighth book of the Æneid. Some ſhepherds, ſays he, having one day caught Mercury, called by the Greeks Hermes, (ſee INTERPRETER,) aſleep on a mountain, cut off his hands; from which he, as well as the mountain where the action was done, became denominated Cyllenius, from κυλλος, *maimed:* and thence, adds Servius, it is, that certain ſtatues without arms are denominated Hermeſes or Hermæ. But this etymology of the epithet of Cyllenius contradicts moſt of the other ancient authors; who derive it hence, that Mercury was born at Cyllene, a city of Elis, or even on the mountain Cyllene itſelf, which had been thus called before him.

Suidas gives a moral explication of this cuſtom of making ſtatues of Mercury without arms. The Hermeſes, ſays he, were ſtatues of ſtone placed at the veſtibules or porches of the doors and temples at Athens; for this reaſon, that, as Mercury was held the god of ſpeech and of truth, ſquare and cubical ſtatues were particularly proper; having this in common with truth, that, on what ſide ſoever they are viewed, they always appear the ſame.

It muſt be obſerved, that Athens abounded more than any other place in Hermeſes; there were abundance of very ſignal ones in divers parts of the city, and they were indeed one of the principal ornaments of the place. They were alſo placed in the high-roads and croſs-ways, becauſe Mercury, who was the courier of the gods, preſided over the high-ways; whence he had his ſurname of Trivius, from *trivium;* and that of Viacus, from *via*.

From Suidas's account, above cited, it appears that the terms, *termini*, uſed among us in the door-caſes, balconies, &c. of our buildings, take their origin from theſe Athenian Hermeſes; and that it was more proper to call them *hermetes* than *termini*, becauſe, though the Roman termini were ſquare ſtones, on which a head was frequently placed, yet they were rather uſed as land-marks and mere-ſtones than as ornaments of building.

Hermes, in the Egyptian mythology, like Mercury in the Grecian, was the inventor of the lyre, to which he gave three ſtrings, producing three different ſounds, the grave, the mean, and the acute: the grave anſwered to winter, the mean to ſpring, and the acute to ſummer.

Among the various opinions of the ſeveral ancient writers who have mentioned the invention of the lyre, and confined it to the Egyptian Mercury, that of Apollodorus is the moſt intelligible and probable. "The Nile," ſays this writer, "after having overflowed the whole country of Egypt, when it returned within its natural bounds, left on the ſhore a great number of dead animals of various kinds, and, among the reſt, a tortoiſe, the fleſh of which being dried and waſted by the ſun, nothing was left within the ſhell but nerves and cartilages, and theſe being braced and contracted by deſiccation, were rendered ſonorous; Mercury, in walking along the banks of the Nile, happening to ſtrike his foot againſt the ſhell of this tortoiſe, was ſo pleaſed with the ſound it produced, that it ſuggeſted to him the firſt idea of a lyre, which he afterwards conſtructed in the form of a tortoiſe, and ſtrung it with the dried ſinews of dead animals."

HERMESIA, a name given by ſome authors to hermetic chemiſtry.

HERMESIAS, in *Botany*, a name given by Lœfling to the genus called *Brownæa* by Jacquin and Linnæus. See BROWNÆA.

HERMESKEIL, in *Geography*, a town of France, in the department of the Sarre, and chief place of a canton, in the diſtrict of Birkenfeld. The place contains 1061, and the canton 15,892 inhabitants, in 38 communes.

HERMETIC, or HERMETICAL *Art*, a name given to chemiſtry, on a ſuppoſition that Hermes Triſmegiſtus was the inventor of it, or that he excelled in it. See ALCHYMY and CHEMISTRY.

We know but little of this Hermes; only that he was an ancient king of Egypt, a thouſand years prior to Æſculapius. Zozimus Panopolity mentions him as having wrote of natural things; and there are ſeveral pieces ſtill extant under his name, but they are all ſuppoſititious.

The numerous books upon theology, aſtronomy, and medicine, are aſcribed by Marſham (in Chron. ſac. 1.) to the ſecond Mercury, the ſon of Vulcan, who, according to Euſebius,

bius, (in Chron.) lived a little after Moſes, that is, about 50 years after the Exodus of the Iſraelites; and this learned author, relying upon the authority of Manetho, cited by Syncellus, reckons that this ſecond Mercury is he who was ſurnamed "Triſmegiſtus," or thrice-great. According to Manetho, this ſecond Hermes or Mercury tranſlated from engraved tables of ſtone, that had been hidden in the earth, the ſacred characters written by the firſt Hermes or Mercury, called Thaut or Thoth, and wrote the explanation in books which were depoſited in the Egyptian temples; and thus eſtabliſhed his authority, obtained a high degree of reſpect among the people, and was long revered as the reſtorer of learning. From the tables of the firſt Hermes he is ſaid to have written, as commentaries and explanations, an incredible number of books. Theſe books, according to Clemens Alexandrinus (Strom. l. 6.) amounted in number to 42; and it was impoſſible for the Egyptians to carry their veneration for them higher than they did. They were borne in their proceſſions with great ceremony and reſpect. Firſt of all appeared the "Chanter," who had two of them in his hands, one containing the hymns in honour of the gods, and the other rules according to which the kings were to govern. Next came the "Horoſcopus," or that miniſter, as Clemens informs us, who carried the four books of aſtronomy, one treating of the fixed ſtars, another of the eclipſes of the ſun and moon, and the two laſt of the riſing of theſe two luminaries. Then appeared the ſacred "Scribe," with 10 books that treated of coſmography, geography, the deſcription of the Nile, &c.: then followed the "Stoliſt" with other 10 books on the ſubject of religion, *viz.* ſacrifices, prayers, feſtival days, &c. The "Prophet" came next, with 10 books, which were named ſacerdotal, and treated of the laws of the gods, and of eccleſiaſtical diſcipline. Thus, ſays the author now cited, there were 42 books in all, of which 36 comprehended all that belonged to the Egyptian philoſophy; and the other ſix regarded medicine, and treated of anatomy, medicaments, diſeaſes of the eyes, of women, &c. Theſe books, long ago loſt, if any ſuch ever exiſted, furniſhed Sanchoniathon with his theogony. (See MERCURY.) Many ſubjects, on which theſe writings are ſaid to have treated, were unknown in the early period of the Egyptian philoſophy. There can be little doubt, therefore, that they were the forgeries of a later age, when it became one of the common artifices of impoſture to give the ſanction of antiquity to fiction.

HERMETICAL PHILOSOPHY, is that which undertakes to ſolve and explain all the phenomena of nature from the three chemical principles, ſalt, ſulphur, and mercury.

A conſiderable augmentation was made to the ancient hermetical philoſophy, by the modern doctrine of alkali and acid.

HERMETICAL *Phyſic* or *Medicine*, is that ſyſtem or hypotheſis in the art of healing, which explains the cauſes of diſeaſes, and the operations of medicine, on the principles of the hermetical philoſophy, and particularly on the ſyſtem of alkali and acid.

HERMETICAL *Seal*, a method of ſtopping or cloſing glaſs tubes or veſſels, for chemical or other operations, ſo very accurately, that nothing can exhale or eſcape, not even the moſt ſubtle ſpirits.

It is performed by heating the neck of the tube or veſſel in the flame of a lamp till it be ready to melt, and then with a pair of pincers twiſting it cloſe together. This they call putting on *Hermes's ſeal*.

There are alſo other ways of ſealing veſſels hermetically; *viz.* by ſtopping them with a plug or ſtopple of glaſs, well luted into the neck of the veſſel; or, by turning another ovum philoſophicum upon that wherein the matter is contained.

For ſealing a ſmall tube hermetically, it is ſufficient to hold it in the flame of the lamp for a little time, ſlowly turning it round, when the end will melt, and falling in, will cloſe the cavity with a neat button. This operation may be aided by puſhing the ſoftened ends in towards the common centre with an iron needle. But if the tube be large, the quantity of glaſs forming the button at the end muſt be diminiſhed, by ſoftening the end of the tube in the flame, and applying to it a piece of another tube nearly of the ſame ſize, which will firmly adhere to it. Then let the tube which is to be ſealed be ſoftened a little higher up than the point of juncture, and pull the two ſlowly in contrary directions, till they ſeparate. The tube will then draw out at the heated part into two ſhort thin funnels, and a little turning and management of the flame will readily ſeal that which is wanted, leaving the joined ends, and about an inch of the lower part of the tube, on the waſte-piece. See LAMP *Blowing*.

HERMETRA, in *Geography*, one of the ſmaller weſtern iſlands of Scotland, N.E. of North Uiſt. N. lat. 57° 38'. W. long. 7° 3'.

HERMHARPOCRATES, or HERMARPOCRATES, in *Antiquity*, a deity, or figure of a deity, compoſed of Mercury and Harpocrates, the god of ſilence.

M. Spon gives us a Hermharpocrates in his Rech. Cur. de l'Antiquité, p. 98. fig. 15. having wings on his feet like Mercury, and laying his finger on his mouth like Harpocrates. It is probable they might mean, by this combination, that ſilence is ſometimes eloquent.

HERMIANI, or HERMIATITÆ, in *Eccleſiaſtical Hiſtory*, a ſect of heretics in the ſecond century, thus called from their leader Hermias. They are alſo denominated Seleuciani.

One of their diſtinguiſhing tenets was, that God is corporeal: another, that Jeſus Chriſt did not aſcend into heaven with his body, but left it in the ſun.

HERMIAS, in *Biography*, a writer towards the cloſe of the ſecond century, according to Cave and Lardner, who has left us a ſhort but elegant diſcourſe, entitled "A Deriſion, or Banter, of the Gentile Philoſophers." The work ſhews that, in the time of the writer, Gentiliſm prevailed, and that it muſt have been written before the fall of Paganiſm. The author quotes 1 Cor. iii. 19.

HERMINE, in *Ancient Geography*, a town ſituated on the northern part of the Elide, near Cyllene, and ſaid by Pauſanias to have been founded by Actor, ſon of Phœbas and Herminia, who gave it his mother's name. A promontory preſerved its name.

HERMINE, L', in *Geography*, a town of France, in the department of Vendée, and chief place of a canton, in the diſtrict of Fontenay-le-Comte. The place contains 406, and the canton 10,594 inhabitants, on a territory of 327½ kiliometres, in 19 communes.

HERMINIUS MONS, in *Ancient Geography*, a chain of mountains of Spain, in Luſitania, towards the ſouth of Maidobriga.

HERMIONE, CASTRI, a town of the Argolide, at the extremity of the peninſula, which is extended to the ſouth-eaſt. According to Pauſanias the ancient town was in ruins in his time, but the new one appeared to be in a very flouriſhing ſtate. It belonged to the Dryopes, and was founded by Hermion, the ſon of Europus. In proceſs of time the Dorians of Argos eſtabliſhed themſelves in this place. It was particularly conſecrated to Ceres and Proſerpine, and the temples of theſe deities ſerved as an aſylum. From Plutarch we learn that it was burnt

burnt by pirates, who defolated the Roman empire in the time of Pompey, and who were deſtroyed by him in the year 67 B. C. This town had ſeveral ancient monuments; *e. g.* a temple of Venus, ſurnamed Pontia and Limenia, *i. e.* the protectreſs of ſeas and ports; a temple of Bacchus Menalegis, in which were celebrated every year muſical combats, and here alſo were diſtributed prizes to the beſt navigators and ſwimmers; and a temple of Diana Iphigenia, in which was a bronze figure of Neptune ſeated on a dolphin. Near this town was a gulf of Peloponneſus, named "Hermionicus Sinus."

HERMISIUM, a town of the Tauric Cherſoneſus, ſituated near the Cimmerian Boſphorus, N. of Boſphorus.

HERMIT, EREMIT, or EREMITA, a devout perſon retired into ſolitude, to be more at leiſure for prayer and contemplation, and to diſencumber himſelf from the affairs of the world.

The word is formed from the Greek ἔρημος, *eremus*, *wilderneſs*; and according to the etymology ſhould rather be written *eremit*, the ſpirit being ſoft.

An hermit is not reputed a religious, unleſs he have made the vows.

Paul, ſurnamed the *Hermit*, *Paulus Eremitanus*, towards the cloſe of the ſecond century, is uſually reckoned the firſt hermit; though St. Jerom, at the beginning of the life of that ſaint, ſays, it is not known who was the firſt. Some go back to John the Baptiſt, and others to Elias.

Others make St. Anthony the founder of the hermitical life; but others take him to have only rekindled and heightened the fervour of it; and hold, that the diſciples of the ſaint owned Paul for the firſt perſon that practiſed it, who fled into the moſt ſolitary deſerts of Thebais, where he led, during the ſpace of ninety years, a life more worthy of a ſavage animal, than of a rational being. Nevertheleſs this unſociable manner of life was very common in Egypt, Syria, India, and Meſopotamia, not only long before his time, but even before the coming of Chriſt; and it is ſtill practiſed among the Mahometans as well as Chriſtians, in thoſe dry and burning climates: for the glowing atmoſphere that ſurrounds theſe countries is a natural cauſe of that love of ſolitude and repoſe, of that indolent and melancholy diſpoſition, that are very common among their languid inhabitants. The perſecutions of Decius and Valerian are ſuppoſed to have been the occaſion; though the fanatical ſyſtem of theology, derived from the Platonic ſchool, and adopted by Origen and his diſciples, that prevailed at this period, contributed to form the taſte and temper of the firſt hermits.

Several of the ancient hermits, as St. Anthony, &c. though they lived in deſerts, had yet numbers of religious accompanying them.

There are alſo divers orders and congregations of religious, diſtinguiſhed by the title of hermits; as, hermits of St. Auguſtine, of St. John Baptiſt, of St. Jerom, of St. Paul, &c.

HERMITS *of St. Auguſtine*, is a religious order, more frequently called Auguſtins, or Auſtin-friars. See AUGUSTINS.

HERMITS *of Brittini*, was a congregation formed under pope Gregory IX. who gave them the rule of St. Auguſtine.

Their firſt hermitage or abode was in a ſolitary place, called Brittini, in the marquiſate of Ancona: whence the name. They led a very auſtere life: they never eat any meat, and faſted much.

HERMITS *of Camaldulia*. See CAMALDULIANS.

HERMITS *of St. Jerom*. See JERONYMITES.

HERMITS *of St. John Baptiſt*, was a religious order in Navarre, whoſe principal convent, or hermitage, was ſeven leagues from Pampelona.

Till the time of Gregory XIII. they lived under the obedience of the biſhop of that city; but the pope confirmed them a religious order, approved their conſtitutions, and admitted them to make the vows. Their way of living was exceeding auſtere; they went bare-footed, wore no linen, lay on boards, with a large ſtone for their pillow, and bore a large wooden croſs on their breaſts.

Their houſe was a kind of laura, rather than a convent, cantoned out into cells, in which they lived ſolitary in the middle of a wood.

HERMITS *of St. Paul*, the firſt hermit, is an order formed in the 13th century, by the union of two bodies of hermits in Hungary, *viz.* thoſe of St. James de Patach, and thoſe of Piſilia near Zante.

Upon being incorporated, they choſe St. Paul, the firſt hermit, for the common patron and protector of their order, and aſſumed his name. They multiplied very conſiderably in Hungary, Germany, Poland, and other provinces; and, at length, came to have ſeventy monaſteries in Hungary alone; but the revolutions and wars in that kingdom reduced them again.

HERMITAGE properly ſignifies a little hut, or habitation, in ſome deſart place, where a hermit dwells.

HERMITAGE is alſo popularly attributed to any religious cell, built and endowed in a private and recluſe place, and thus annexed to ſome large abbey, of which the ſuperior was called *hermita*.

HERMITAGE, in *Geography*, a town of Weſt Florida, on the S.W. ſide of the river Miſſiſſippi; 7 miles S.W. of New Orleans.

HERMIT'S BAY, a bay on the iſland of St. Chriſtopher, on the N. coaſt, a little S. of Madan's point.

HERMITE'S ISLANDS, a group of iſlands of unequal extent, ſituated before Naſſau bay, at the ſouthern extremity of Terra del Fuego. This name is derived from Mynheer Hermite, admiral of the Dutch fleet, in the year 1624. See *Cape* HORN.

HERMO, or BERAM, a town of Iſtria; 28 miles S. of Trieſte.

HERMODACTYL, or *Snake-headed Iris*, in *Botany*. See IRIS.

HERMODACTYLS, in the *Materia Medica*, a drug uſed as a gentle purgative, &c.

The hermodactyl is a root about the ſize of a little cheſnut, in figure reſembling a heart; ruddy without, very white within; of a light fungous ſubſtance, without fibres; eaſily broken, and reducible into a powder like flower; of a ſweetiſh taſte, but ſomewhat viſcid. It is brought to us dried, from Egypt, Syria, and Turkey.

Theſe have been too generally ſuppoſed a fruit, but they are unqueſtionably a root, and ſeem to be the roots of that ſpecies of meadow-ſaffron, called by authors *colchicum Chinenſe floribus fritillariæ inſtar variegatis, foliis undulatis*, or the Chineſe meadow-ſaffron, with undulated leaves, and with flowers chequered like thoſe of the fritillary. They were in great uſe among the ancients as a purge; but their operation is very ſlow, tedious, and fatiguing, and therefore they have been commonly quickened with aloes and other cathartics. They are beſt corrected by being joined with aromatics, and are now ſometimes uſed, mixed with jalap, in rheumatiſms. The women of Egypt eat the freſh roots roaſted, to make them grow fat.

Hermodactyls were chiefly uſed to purge pituitous humours of the brain and joints. They were deemed ſo efficacious

cacious in ſcouring the mucilaginous glands, and preſerving them from the lodgments of gritty matters, which occaſion the gout and arthritic complaints, that they were denominated, by ſome writers, *anima articulorum*. They alſo promote ſweat. They are now expunged by the colleges both of London and Edinburgh from their catalogues of officinals.

HERMODE, in *Mythology*, the name of a divinity worſhipped by the ancient inhabitants of the North, or Goths; he was reputed to be the ſon of Odin, the firſt of their gods.

HERMOGENEAN Code, in *Law*. See Code.

HERMOGENES, Tigellius, in *Biography*, cited by Horace, ſat. iii. l. 1.

"Ut, quamvis tacet Hermogenes, cantor tamen, atque
Optimus ut modulator."

"Though Hermogenes ſings no more, he is nevertheleſs an excellent muſician."

He was probably the ſon or brother of Tigellius, a famous muſician in the time of Cæſar and Auguſtus; who muſt have been an exquiſite ſinger; for Horace makes his obtruſive companion ſay:

"Invideat quod et Hermogenes, ego canto."

"I ſing till I throw Hermogenes into deſpair."

St. Hermogenes's *Iſland*, in *Geography*, an iſland on the N.W. coaſt of America, about ſix leagues in circuit, ſeparated from the adjacent coaſt by a channel one league broad. This was thought by the famous navigator Beering to be a cape, ſituated in N. lat. 58° 15′. E. long. 207° 45′. In a later account of his voyage publiſhed by Mr. Stæhlin, cape St. Hermogenes, and all the land diſcovered by Beering to the S.W. of it, are made to be a cluſter of iſlands; and St. Hermogenes is placed among thoſe which are deſtitute of wood. This account was fully confirmed in Cook's Third Voyage, ſee vol. ii. p. 384.

HERMOGENIANS, a ſect of ancient heretics, denominated from their leader Hermogenes, who lived towards the cloſe of the eleventh century.

Tillemont, with whom Dr. Lardner agrees, places him before the end of the reign of Marcus Antoninus, who died in the year 180. He is ſuppoſed to have been a native of Africa; and from Tertullian we learn, that he was ſkilled in the art of painting; and he ſeems to have been originally a Chriſtian, and not only learned and ingenious, but likewiſe virtuous; for though Tertullian, who wrote againſt him, intimates that of a Chriſtian he became a philoſopher and ſtoic, he does not charge him with any vice. Hermogenes, though denominated a heretic, does not ſeem to have formed a party, or ſet up a ſeparate communion. He was willing to communicate with Catholic Chriſtians, if they would admit him; though he indulged himſelf in ſpeculations that deviated from the ſentiments that were generally adopted. It is undeniable that he received and reſpected the ſcriptures of the Old and New Teſtament, as other Chriſtians of his time did. If he was an author, which is not improbable, we have no account of any of his writings; and that none of them remain, if any ever exiſted, furniſhes occaſion of indecent and illiberal triumph to Cave.

Hermogenes eſtabliſhed matter as his firſt principle, and co-eternal with the Deity; and regarding matter as the fountain of all evil, he maintained that the world, and every thing contained in it, as alſo the ſouls of men and other ſpirits, were formed by the Deity from an uncreated and eternal maſs of corrupt matter.

If the world had been made out of nothing, he feared

that the evil ſubſiſting in it muſt have been aſcribed to the will of God, which, in his opinion, would have been a reflection on his goodneſs. But matter, out of which the world was made, being inherently evil, he ſuppoſed that he thus vindicated the Supreme Being. Hermogenes aſſerted one God ſupreme over all, maker of the world, unchangeably good, with whom no other being could be compared. He admitted no Æons, nor any creator different from the one God the father; but he ſaid that matter was eternal, and God made the world out of it. To this matter he aſcribed all the evil and all the defects which exiſt in any creatures. Matter had always a confuſed and irregular turbulent motion, but God wrought order and beauty, and proportion, out of that confuſed and indigeſted matter. It does not appear what were his conceptions concerning the perſon of Jeſus Chriſt. Theodoret ſays, he thought the body of Jeſus was lodged in the ſun. Although he taught that God made the ſoul out of matter, he does not ſeem to have denied human liberty. Theodoret informs us, that Hermogenes believed that the devil and dæmons would be again reſolved into matter; from which they had ariſen; nor is it improbable that he might conceive the confluence of matter, or ſome part of it, to be the abyſs and place of torment aſſigned to the devil and his angels at their final condemnation. Hence he appears to have believed a future judgment, and probably all the other great articles of religion.

The opinions of Hermogenes, with regard to the origin of the world and the nature of the ſoul, were warmly oppoſed by Tertullian.

The Hermogenians were divided into ſeveral branches, under their reſpective chieftains, *viz.* Hermiani, Seleucians, Materiari, &c.

Some will have the Manichees alſo to have ſprung from the Hermogenians. Lardner's Works, vol. ix.

HERMOGENIANUS, in *Biography*, an eminent juriſt, flouriſhed in the fourth century, publiſhed an "Abridgment of Law," in ſix books, in Latin, in which he follows the order of the Perpetual edict. It commences with the reign of Adrian, and is highly ſpoken of by writers on the Roman law. Moreri.

HERMON, in *Ancient Geography*, a mountain, or rather chain of mountains, of Paleſtine, in the tribe of Iſſachar, on this ſide of Jordan, S. of mount Tabor. It was noted for its height, and for being, like Lebanon, capped with ſnow. It was once famous for an ancient temple held in great veneration, and much reſorted to by the ſuperſtitious heathens from all the neighbouring countries, and in the book of Pſalms (Pſ. cxxxiii. 3.) for its refreſhing dews, which deſcended on the adjoining mount of Sion. St. Jerom tells us, that it was above the Panias; that its ſnow was carried to Tyre and Sidon, to be uſed in cooling liquors; and the Chaldees and Samaritans ſtyle it the "Mount of Snow."

HERMONASSA, a town of the Cimmerian Boſphorus, and one of the four which Pomponius Mela places in this peninſula.—Alſo, a town of Aſia, in the Pontus Polemoniacus, and on the ſame gulf with Ceraſunte.

HERMONAX, a town which belonged to the Tyrians, ſituated on the ſea-coaſt, and at the mouth of the river Tyras.

HERMONIUS Sinus, a gulf of Aſia Minor, in the Boſphorus of Thrace, N.E. of the promontory of Boſphorus.

HERMONTHIS, a town of Egypt, and capital of the "Nomos Hermonthites," bounded by the nome of

Memnon to the N., that of Thebes and the Nile to the E., the Dodæcaſchænes to the S., and the mountains of Libya to the W. Ptolemy places Hermonthis, which he writes Hermunthis, between Thebes and the town of the Crocodiles. This city had two temples, conſecrated to the honour and worſhip of Apollo and Jupiter. They may be ſtill ſeen in ſome degree of preſervation at the village called *Aumant*, built near the ſcite of Hermonthis. The temple of Apollo is ſmall; its walls are formed of granite, and round it runs a freeze covered with ſparrow-hawks, conſecrated to the god. All its aſpects are decorated with hieroglyphics: four rows of human figures are carved without, and three within. The building is divided into ſeveral halls: five falcons, with their wings ſpread, adorn the cieling of the firſt; golden ſtars ſhine upon the roof of the ſecond. Here are two rams which look at each other, with hieroglyphics; and two marble oxen occupy the extremity of this apartment. Around it are ſeen women ſuckling their children. Before this temple was a large building, of which the foundations only remain. Beyond is a large baſon, deſtined to receive the waters of the Nile. At a farther diſtance, on the bank of the river, is another edifice, probably the temple of Jupiter, which the Chriſtians have converted into a church, and over the Egyptian hieroglyphics and inſcriptions they have painted croſſes.

HERMOPAN, in *Ancient Mythology*, a figure compoſed of Mercury and Pan.

HERMOPOLIS, in *Ancient Geography*, or the town of Hermes, the name of three towns in Egypt; the *firſt* was in the Delta, below Sebennytus, and nearer the ſea, E. of Buto; the *ſecond* in the nome of Alexandria, without the Delta, W. of the weſtern branch of the Nile; and the *third*, or "Hermopolis Magna," in the Heptanomis or Hermopolite nome, W. of the Nile and at ſome diſtance from it, and 59 miles from Lycopolis. Pliny calls it, by a tranſlation of the Greek name into Latin, "Mercurii Oppidum." According to Ammianus Marcellinus, this was a celebrated city.

Hermopolis, an epiſcopal city of Aſia, in Iſauria.—Alſo, a town of Aſia, in Carmania.

HERMOPOLITUS Nomos, a country of Egypt, in Heptanomis, bounded N. by the Cynopolite nome, E. by the Nile; S. by the Nycopolite nome; and W. by the mountains of Libya. Its metropolis was Hermopolis Magna.

HERMOSELLO, in *Geography*, a town of Spain, in the province of Leon, at the conflux of the Duero and the Tormes; 9 miles below Miranda de Duero.

HERMOSIRIS, is a ſtatue of Mercury and Oſiris, with the diſtinct attributes of thoſe divinities united; *viz.* the caduceus for Mercury, and the head of an hawk with an eagle for Oſiris.

HERMOSMENON, in the *Greek Muſic*, a term which implied morals, propriety, and fitneſs. It conſiſted in knowing how to chuſe, upon all occaſions, what belonged to the mode or key, to the ſubject, the rhythm, the melody, the voice of the ſinger; and promiſcuouſly to uſe every thing belonging to a key or movement alike on all occaſions. The *moral* part of compoſition is ſelection and rejection, that all may naturally ariſe out of the ſubject, and ſeem to belong to no other theme or occaſion.

HERMULES were two ſmall ſtatues of Mercury placed in the Circus at Rome.

HERMUNDURI, in *Ancient Geography*, a people who inhabited the eaſtern extremity of Germany, and who worſhipped Mars and Mercury. In a war with the Catti for the poſſeſſion of a ſalt-pit, they devoted the hoſtile army to theſe deities. Tacitus ſays, that in proceſs of time they became allies to the Romans, who diſtinguiſhed them above other Germans by peculiar privileges.

HERMUPOA, in *Botany*, the name of an hexandrous plant in Lœfling's *Iter Hiſpanicum*, which he deſcribes as naturally akin to *Breynia*, (meaning that of Plumier, which Linnæus makes a *Capparis*,) but with a double perianth. The flowers are ſcarlet. We do not find his deſcription or name cited by Linnæus.

HERMUS, in *Geography*, a conſiderable river of Aſia Minor, which flowed from a mountain ſacred to Cybele, and diſcharged itſelf in the ſea near Phocea. It received, beſides other rivers, the Pactolus and Hyllus. This river watered plains, which were on this account called "Hermi Campi." Theſe plains were thoſe of Sardis and Smyrna. The gulf into which it diſcharged itſelf was anciently called the "Hermæan Gulf;" but when Theſeus, a perſon of diſtinction in Theſſaly, founded on this gulf a town, which he called Smyrna, after the name of his wife, the gulf was denominated "Smyrnæus Sinus," or the gulf of Smyrna, a name which it ſtill retains. The river, as D'Anville ſays, is called "Saravat," but according to M. Peyſſonnel, "Bouroun."

HERN, in *Ornithology*. See Heron.

Hern *Iſland*, in *Geography*, a ſmall iſland on the W. coaſt of Africa, at the mouth of the Rio del Oro. N. lat. 23° 35.

HERNANDEZ, Francis, in *Biography*, a naturaliſt and phyſician, who was ſent out by Philip II. king of Spain, to make obſervations on, and to deſcribe, the natural productions of Spaniſh America. His pecuniary allowance for this purpoſe appears to have been ample, and he ſpared no expence to make himſelf acquainted with ſuch objects as he was in ſearch of. He wrote an account of their nature and properties, but it does not appear that he lived to ſuperintend the publication of his labours, for in 1651 the reſult of his enquiries was edited at Rome under the care of the Lyncæan academy, eſtabliſhed in that city; the papers of Hernandez having been purchaſed by Frederic Ceſi, a young nobleman who founded, and was perpetual preſident of the Lyncæi. This work had originally been publiſhed in the Spaniſh language at Mexico, under the name and care of Francis Ximenes, but the Roman edition, in ſmall folio, came out in Latin, having the following title, "Nova Plantarum, Animalium et Mineralium Mexicanorum Hiſtoria, a Franciſco Hernandez, Medico, in Indiis præſtantiſſimo primum compilata. Dein a Nardo Antonio Recchio in volumen digeſta, a Johanno Terentio, Johanno Fabro, et Fabio Columna, Lyncæis, notis et additionibus longe doctiſſimis illuſtrata." The original drawings of this work were procured by Hernandez, who paid the immenſe ſum of ſixty thouſand ducats for them; they had been drawn at the time when Joſeph a Coſta was in America, but the numerous wooden cuts which accompany this volume are by no means equal to what might have been expected from the account we have of the drawings, and this called forth an obſervation of regret from Linnæus, that the work did not anſwer the trouble and expence which had been beſtowed upon it. It muſt, however, be remarked, that no blame ſhould attach to the memory of Hernandez, but to his editors on this account. What became of him is not recorded, but his drawings were conſumed by a fire in the Eſcurial. Among the figures are ſome curious animals, but the plants compoſe the chief bulk of the work. Some of his repreſentations are ſo extraordinary, that their truth has been doubted

doubted, for inſtance his *Macpalxochiquahvitl*, the form of which is ſo ſtrange, that ſome error was reaſonably expected. His accuracy, however, has lately been verified, even in this inſtance. The plant, whoſe large united ſtamens exactly reſemble a bird's foot, is of the malvaceous order, and is recently figured in a ſplendid French work. We have ſeen a ſpecimen preſerved in ſpirits at ſir Joſeph Banks's. No doubt his *Lyncea*, 266, which ſeems to be a moſt magnificent ſpecies of *Dendrobium*, is equally faithful. This plant occurs perpetually as an embelliſhment in various parts of his book. His *Flos Tigridis*, 276, for a long time no leſs a problem to botaniſts, is now well known in our gardens, and one of their moſt ſplendid ornaments; ſee Curt. Mag. t. 532. Some intereſting matter, furniſhed by Fabius Columna, occurs at the end of the volume, where the gum Arabic, *Mimoſa*, the *Lobelia Cardinalis*, and the Paſſion-flower, *Paſſiflora incarnata*, are well repreſented. A curious phytoſcopic table, by Frederic Ceſi, by far too profound to be epitomized or explained, is ſubjoined. Hernandez does not appear to have publiſhed any other works on natural hiſtory, but this will entitle him to our gratitude for having firſt unfolded to European botaniſts, the treaſures of that then little known quarter of the world. The Mexican names are always given, and his medical obſervations are general and good. A hiſtory of the church at Mexico has been aſcribed to our author, but without certainty. Hall. Bibl. Bot. Moreri. Linn. Crit. Bot. Hernand. Hiſt.

HERNANDIA, in *Botany*, a genus named by Plumier in honour of Francis Hernandez, phyſician to Philip II. who firſt explored the natural productions of the new world. See HERNANDEZ. Linn. Gen. 484. Schreb. 627. Willd. Sp. Pl. v. 4 327. Plum. Gen. 6. t. 40. Jacq. Amer. 245. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 3. 333. Juſſ. 81. Lamarck. Dict. v. 3. 122. Illuſtr. t. 755. Gærtn. t. 40. Claſs and order, *Monœcia Triandria*. Nat. Ord. *Tricoccæ*, Linn. *Lauri*, Juſſ.

Gen. Ch. Male, *Cal.* a partial involucrum, three-flowered, with four, ovate, obtuſe, much ſpreading leaflets; perianth none. *Cor.* Petals ſix, ſomewhat ovate, ſpreading; the three interior ones narrower; nectary of ſix round, capitate glands, ſituated about the filaments. *Stam.* Filaments three, ſhorter than the petals, inſerted into the receptacle; anthers erect, oblong, large.

Female, *Cal.* an involucrum common with the males; perianth inferior, of one campanulate, entire, perſiſtent leaf. *Cor.* Petals eight, the four interior ones narrower, all placed upon the germen; nectary of four obovate glands. *Piſt.* Germen roundiſh; ſtyle thread-ſhaped; ſtigma oblique, ſomewhat funnel-ſhaped, large. *Peric.* a dry, ovate, eight-furrowed, ſingle-celled drupa, incloſed in the greatly enlarged, inflated, roundiſh perianth. *Seed* a globoſe, lightly depreſſed nut.

Eſſ. Ch. Male, Calyx deeply three-cleft. Corolla of three petals.

Female, Calyx truncated, entire. Corolla of ſix petals. Drupa hollow, open at the mouth, its coat unconnected with the nut.

1. *H. ſonora*. Jack-in-a-Box. Linn. Sp. Pl. 1391. Hort. Cliff. 485. t. 33.—"Leaves peltate."—A native of the Weſt Indies, and firſt cultivated in the ſtoves of our own country by the ducheſs of Beaufort, in the year 1714. It is very curious that the plant in queſtion ſhould be found in Ceylon, as well as in the Weſt India iſlands. This lofty *tree* has a very rugged *trunk*, but the ſmaller branches are ſmooth and green. *Leaves* ovate, pointed, ſmooth, and ſhining; their footſtalk inſerted into the back an inch or more above the baſe, ſo that they are, as it were, pendent; red, radiating veſſels mark the place of inſertion on the upper ſide. Linnæus juſtly extols the beauty of the foliage of this tree. The *flowers* are ſmall and yellowiſh, in panicled cluſters. The *fruit* when ripe rattles in the permanent calyx, whoſe orifice is too ſmall to admit of its falling out.

2. *H. ovigera*. Linn. Sp. Pl. 1392; (Arbor ovigera; Rumph. Amboin. v. 3. 193. t. 123.)—"Leaves heart-ſhaped, ovate, pointed, flat."—A native of the Eaſt Indies, growing in woods by the ſhore of large rivers.

A *tree* with *leaves* ſix inches long, diſtinguiſhed from the former by having their footſtalks inſerted as uſual, and not in a peltate manner. This ſpecies is taken up from Rumphius, whoſe figure is leſs than the natural ſize, the *fruit* of the plant being as large as an egg, and ſimilar in ſtructure to the nut of *H. ſonora*.

3. *H. guianenſis*. Willd. Sp. Pl. v. 4. 328. Aubl. Guian. v. 2. 849. t. 329.—"Leaves heart-ſhaped, oblong, pointed, folded, bracteas whorled."—Native of woods in Guiana. This tree riſes to the height of 60 feet, and has a light aromatic *wood*. *Leaves* longer in proportion than the laſt. The *panicle* is accompanied by ſeveral whorls of ovate acute bracteas. The *calyx* of the fruit is elliptical, obtuſe, ſpotted with red, ſcarcely a fifth part the ſize of the laſt. The *flowers* appear in February, and being very numerous, of a greyiſh colour, render the tree very conſpicuous in that ſtate. The inhabitants of Cayenne uſe the kernel as a purgative medicine.

HERNANDIA, in *Gardening*, compriſes plants of the exotic evergreen kind, of which the ſpecies principally cultivated is the whiſtling hernandia (H. ſonora), which in the Weſt Indies is frequently denominated the Jack-in-a-box tree.

Method of Culture.—The plants in this caſe are to be raiſed by ſowing the well ripened ſeeds upon a hot-bed in the ſpring ſeaſon. As ſoon as the young plants are about two inches in height, they ſhould be tranſplanted ſeparately into pots filled with freſh rich earth, and replunged into the hot-bed, care being taken to water and ſhade them until they have taken new root, after which air ſhould be admitted by elevating the glaſs-frames, in proportion to the ſtate of the atmoſphere, in reſpect to warmth, and the degree of heat thrown up by the bed; the plants being frequently watered. As the plants advance in growth they muſt be removed into larger pots, great care being taken not to break or injure the root, but to preſerve a good ball of earth about them. If their leaves ſhould droop, they ſhould be well protected from the heat of the ſun, until they have ſtricken new root. The beſt period of ſhifting them is about July, as by that means there will be good time for their becoming firmly rooted before the approach of the cold ſeaſon. It is neceſſary to preſerve them conſtantly in the bark ſtove, affording them during the winter a moderate ſhare of heat, and in the ſummer, when the weather is hot, letting them have a full ſupply of air.

Theſe plants have a fine and curious effect among others of the ſame nature.

HERNGRUND, in *Geography*, a town of Hungary, ſituated among the mountains, in the midſt of extenſive mines of copper, which furniſh the chief employment of the inhabitants; four miles N.N.W. of Neuſol.

HERNIA, in the language of *Surgery*, commonly implies a protruſion of ſome of the viſcera, out of the cavity of the belly, into a preternatural bag, conſiſting of the portion of peritonæum which is puſhed before them. The diſeaſe is better known, among perſons who are not of the medical profeſſion, by the name of a *rupture*.

Although ſuch is the ordinary meaning of the term *hernia*, it ought to be underſtood, that the occaſional ſignifications of the word is much more extenſive, comprehending indeed ſeveral diſeaſes, which bear no ſimilitude or analogy whatſoever to one another. Thus, a collection of water in the tunica vaginalis teſtis is ſometimes named *hernia aquoſa*; an inflammation of the teſticle is diſtinguiſhed by the appellation of *hernia humoralis*; and a certain tumour of the brain is frequently denominated *hernia cerebri*. (See FUNGUS *Cerebri*.) But not to digreſs from the ſubject which we now propoſe to treat of, it will be ſeen in the courſe of the following pages, that the definition with which we have ſet out, cannot be applied to ſome forms of diſeaſe, always ranking as herniæ of the abdomen, either becauſe the diſplaced parts undergo no protruſion at all, or are not contained in any bag or pouch, formed by the peritoneum.

As the common expreſſion, *rupture*, tends to convey an erroneous notion, that the diſorder is eſſentially connected with a ſudden burſting, or laceration of ſome part of the ſides of the abdomen, it is undoubtedly objectionable. But ſince long cuſtom ſanctions its employment, while the term hernia is little underſtood out of the profeſſion, and has had aſſigned it no etymological ſenſe, in the leaſt expreſſive of any character of the diſeaſe, which it uſually denotes, we merely prefer it inaſmuch as it cannot communicate any falſe idea reſpecting the nature of the complaint.

The manner in which, of late years, our knowledge of herniæ has been amplified by the diligent inveſtigations of ſeveral able and diſtinguiſhed ſurgeons, is ſuch as cannot fail to raiſe the admiration of every one, at all converſant with the ſubject. At the ſame time, it is ſuch as ought to awaken the ſpirit of emulation and induſtry throughout all the departments of ſurgery, by making us diſtruſt the preſent attainment of any thing like perfection in a ſingle branch of it. When we conſider the vaſt number of heads and pens which have been engaged, at different periods, upon the ſubject before us; when we reflect that there is ſcarcely a great ſurgeon of any age, who has not devoted ſome of his time and attention to the ſtudy of hernia, and a part of his writings to the explanation of it; and finally, when we call to mind the great frequency of the diſeaſe, which muſt have afforded at all times every opportunity of examination; we have ſome reaſon for ſurprize at finding errors of conſiderable conſequence prevailing, even up to the commencement of the preſent century. Our aſtoniſhment, however, muſt immediately ceaſe, when we find that the cauſe of theſe errors has proceeded from a groſs neglect of morbid anatomy, and conſequent ignorance of the real condition of the parts relating to the formation of herniæ in general. With this kind of inattention, it was in vain for ſurgeons to attempt clear and accurate deſcriptions of a diſeaſe, the internal circumſtances of which they did not take the trouble of properly examining by diſſection. The great Percival Pott, ſo renowned for talents and accuracy of obſervation, fell into ſome material miſtakes in his anatomical conception of this diſeaſe, and of courſe his treatiſe on ruptures is, in this reſpect, faulty and imperfect. Camper, a Spaniſh ſurgeon of the name of Gimbernat, and particularly our countrymen Mr. Aſtley Cooper, Mr. William Lawrence, and Mr. Hey, ſeem entitled to the chief ſhare of honour for having introduced more correct opinions concerning many particulars of the diſeaſe.

The importance of ſtudying the ſubject of hernia ſhould be deeply impreſſed upon the mind of every man who is deſirous of practiſing ſurgery, with reputation to himſelf, and benefit to the afflicted. The great frequency of the diſeaſe, the various ſituations and forms in which it preſents itſelf; the different ſtates in which the contents of herniæ are in different caſes; the variety of treatment depending upon this circumſtance; the knowledge of anatomy required in operating; and the danger of miſtaking hernial tumours for others of a totally different kind; are circumſtances which ought to infuſe fear into the heart, and agitation into the conſciences of all, who preſume to call themſelves qualified ſurgeons, without having firſt duly conſidered every thing relating to ſo important a branch of their profeſſion.

The calculations which have been made, of the proportion which men and women afflicted with ruptures, bear to the reſt of the human race, comprehend a very high number. Some ſurgeons, as Arnaud, Gimbernat, and Turnbull, have eſtimated that one-eighth or one-ſixteenth of mankind have ruptures. Knowing, however, that theſe ſtatements are vaſt exaggerations, we only mention them to ſhew that the diſeaſe is one of a moſt common kind. From an inſtructive note, inſerted in Mr. Lawrence's treatiſe on ruptures, edition ii. page 2, it appears that the preceding eſtimate is conſiderably over-rated. Among other things, it is obſerved that "M. Louis aſcertained the number of patients with herniæ in the different hoſpitals of Paris. We ſhould expect to find a greater proportion here, than in mankind at large, ſince theſe very diſorders compel many to ſeek relief at ſuch inſtitutions; yet it will be ſeen that the proportion is not ſo high, &c. Of 7027 perſons in the Salpêtriere, 220 were ruptured; at the Bicêtre, 212 out of 3800; at the Invalides, 142 out of 2500 or 2600; and of the children at the Hôpital de la Pitié, 21 in 1037." Mémoires de l'Acad. de Chir. tom. v. ſupplement, p. 885.

Hernia is a diſeaſe from which no age, ſex, nor condition, is exempt; the youngeſt children, the moſt aged perſons, the rich man, and the poor one, the induſtrious and the indolent, being all liable to be afflicted with it.

Many reaſons, ſays Mr. Aſtley Cooper, may be aſſigned for the very frequent occurrence of protruſions from the abdomen.

Firſt, the viſcera of this cavity are numerous, many of them very moveable, and only looſely connected by peritoneal attachments, with the ſurrounding parts; and they are habitually expoſed to changes of ſize and relative ſituation, from ſudden or gradual diſtention.

Secondly, the parietes of the abdomen are compoſed of muſcles, the action of which is to contract the dimenſions of this cavity, to compreſs the bowels, and thus to force them from their natural ſituation.

Thirdly, for the paſſage of veſſels and nerves, theſe muſcles and their tendons have various apertures, which, though naturally only wide enough for this purpoſe, often become ſo much relaxed as to allow the viſcera themſelves to protrude.

Laſtly, the muſcles are ſometimes themſelves imperfectly formed, and the viſcera eſcape through unnatural apertures. See Anatomy, &c. of Inguinal and Congenital Hernia, chap. i.

The various herniæ receive different appellations, according to their ſituation, and the nature of their contents.

In the male ſex, the moſt frequent caſe is that in which the parts are protruded at the abdominal ring, deſcending in the ſame direction as the ſpermatic cord. Women are alſo ſubject to the ſame ſpecies of rupture, with this difference, that they do not have it nearly ſo often as the other ſex, and when they do, the round ligament of the uterus bears the ſame relation to the hernia, as the ſpermatic cord does to it in males. When the protruded parts deſcend no lower than the groin, the diſeaſe is called a *bubonocele*, or *inguinal hernia*; but

but when they reach down into the ſcrotum, it is commonly named an *oſcheocele*, or *ſcrotal rupture*.

The hernia to which women are moſt liable, is the *crural* or *femoral*, in which the parts are protruded, under Poupart's ligament at the upper part of the thigh, through a ſmall opening in a tendon deſtined for the paſſage of the femoral veſſels. The technical name of *merocele* is ſometimes given to this particular caſe.

In the linea alba, upon the front of the abdomen, there is a round opening, through which, in the fœtal ſtate, the blood-veſſels uſed to paſs from and to the placenta. When the viſcera are protruded through this aperture, the hernia is named *umbilical*, or *exomphalos*, *omphalocel*, &c.

The epithet of *ventral* is given to all protruſions of the viſcera which occur at any part of the belly, except the navel and abdominal ring. Herniæ of this kind are moſt frequent in the courſe of the linea alba.

The *congenital hernia* is ſo named from its generally coming on ſhortly after birth, before the communication between the cavity of the belly, and that of the tunica vaginalis, has been cloſed. The peculiarity of the caſe conſiſts in the protruded parts being lodged in the tunica vaginalis, in contact with the teſticle, and in their having no common hernial ſac. One leſs frequent ſort of congenital hernia, in which the protruded viſcera puſh before them a production of the peritoneum into the tunica vaginalis, will be hereafter deſcribed.

The inguinal, crural, umbilical, ventral, and congenital herniæ, particularly the three former, are thoſe moſtly met with in practice. There are, however, ſome leſs frequent ſorts of hernia, which muſt not be omitted in the preſent work.

Sometimes the viſcera are protruded at the foramen ovale of the pelvis, when the diſeaſe is called a *hernia of the foramen ovale*.

On other occaſions the viſcera are forced between the bladder and rectum in men, and between the uterus and rectum in women, ſo as to be protruded in the perineum. Such a caſe is diſtinguiſhed by the appellation of a *hernia of the perineum*.

A tumour may be produced in the vagina by the diſplaced bowels, when the caſe is named a *vaginal hernia*.

A rare kind of rupture ſometimes occurs at the iſchiatic notch. In this inſtance, the viſcera are protruded by the ſide of the ſciatic nerve under the glutei muſcles, and the diſeaſe is called an *iſchiatocele*, or *hernia of the iſchiatic foramen*.

Diaphragmatic herniæ have alſo been noticed, the viſcera protruding either by the ſide of the œſophagus, the ſide of the vena cava, or leſs commonly by the ſide of the aorta. Herniæ of the diaphragm, however, generally happen through unnatural openings in the muſcle.

Mr. Aſtley Cooper has ſeen a hernia protruding into the labium pudendi, under the ramus of the iſchium, and extending up into the pelvis by the ſide of the vagina.

The ſame eminent ſurgeon has in his poſſeſſion, preparations, exhibiting caſes in which herniæ were formed between the layers of the meſocolon and meſentery. On Inguinal Hernia, p. 2.

Beſides theſe many different ſpecies of herniæ, the bowels ſometimes become ſtrangulated by various kinds of adheſions, by ſlipping through unnatural holes in the meſentery, &c.

The names of herniæ are frequently derived from the nature of their contents. Thus, when the hernia contains nothing but omentum, it is called an *epiplocele*, or *omental rupture*. When it includes inteſtine alone, it is named an *enterocele*, or *inteſtinal hernia*. But when the contents conſiſt both of omentum and inteſtine, it is often denominated an *entero-epiplocele*.

When the bladder is protruded, the hernia receives the name of *cyſtocele*. Alſo, the terms *ſplenocele*, *gaſtrocele*, *hyſterocele*, &c. are occaſionally employed, when the ſpleen, ſtomach, or uterus is contained in the hernia.

When the prolapſed viſcera admit of being returned into the abdomen, without any difficulty, or when they are accuſtomed to aſcend and deſcend ſpontaneouſly, according as the patient is in a recumbent or erect poſture, the caſe is denominated a *reducible hernia*.

When the return of the contents of the tumour, however, is prevented either by adheſions to each other, or to the hernial ſac, or by the increaſed bulk which they have acquired in their unnatural ſituation, the hernia is termed *irreducible*.

Laſtly, when the reduction is rendered impracticable by the conſtriction, which the viſcera ſuffer in the opening through which they have paſſed, the caſe is named a *ſtrangulated*, or *incarcerated hernia*.

This latter ſtate of the diſeaſe proves a frequent cauſe of death, and always demands prompt ſurgical aſſiſtance.

The parts, which moſt commonly form the contents of herniæ, are the omentum and inteſtines. The ilium, in conſequence of its nearneſs to the ring, is moſt frequently protruded. The next, in order of frequency, is the colon; then the cæcum, and often the jejunum. But though theſe are the parts contained in ordinary herniæ, all the reſt of the abdominal viſcera have been known to be protruded in rarer inſtances, with the exception of the pancreas and duodenum, which, owing to the intimate connection they have with the ſpine, hardly admit of being ſufficiently diſplaced.

Only a part of the circle of an inteſtine, or a mere fold, may make the contents of a hernia; but nearly the whole alimentary canal has been been contained in ſome enormous herniæ.

Protruſions of the large inteſtines generally conſiſt, either of the cæcum, or ſigmoid flexure of the colon, theſe being the parts leaſt fixed. The cæcum is uſually protruded on the right ſide; the ſigmoid flexure on the left. Yet the cæcum and vermiform appendix have ſometimes been found in herniæ on the left ſide. (Sandifort Tab. Anat. Expl. of plates 5 and 6. Camper Demonſtrat. Anat. Pathol. part ii. p. 17.) "When we conſider," (ſays an excellent modern writer,) "that the inteſtines may deſcend to the knees, dragging even the ſtomach to the pubes, we ſhall be convinced, that the natural poſition of an organ cannot, of itſelf, enable us to determine at which opening it may be protruded." Lawrence on Ruptures, p. 11. ed. ii.

From the few obſervations already made, it muſt be ſeen, that there is ſcarcely a point of the whole circumference of the abdomen (except where the bones form an inſuperable obſtacle), at which herniæ have not been ſeen. They may occur at any part of the front and ſides of the belly; when the muſcles are imperfect, they may happen in the loins, where the kidnies have actually been protruded (Cooper on Inguinal Hernia, &c. p. 2.); hernial tumours may take place through the diaphragm into the cheſt; or they may exiſt in various ſituations about the pelvis.

The cavity of the abdomen is every where lined by a ſmooth elaſtic membrane, named the peritoneum, which may be regarded as a kind of bag including all the viſcera, and having internal productions, which ſerve to keep the various organs in their reſpective ſituations. Therefore, when a hernia happens, the protruded viſcera neceſſarily carry before them the part of the peritoneum, which happens to be

imme-

immediately between them and the opening, at which the protruſion occurs. The membrane, in fact, becomes elongated into a ſort of pouch, in which the prolapſed parts lie, and to which the appellation of the *hernial ſac* is given. The opening by which the cavity of the ſac communicates with that of the abdomen is comparatively ſmall, and is named its *mouth*; the contracted part, juſt below this, is called its *neck*, while the broadeſt and moſt diſtant portion from the abdomen is denominated its *fundus*. In ſmall recent herniæ the ſac is uſually of the ſame thin texture, as the peritoneum in its natural ſtate. But in large old ruptures, the hernial ſac is ſometimes found to be of an extraordinary thickneſs. It deſerves notice, however, that the thick appearance of the peritoneal ſac is rather owing to the thickened ſtate of ſome membrane-like coverings which it has, conſiſting of faſciæ and condenſed cellular ſubſtance.

It was anciently ſuppoſed that herniæ originated from a laceration of the peritoneum and abdominal muſcles, and hence aroſe the uſe of the term *rupture*. Diſſections have now repeatedly proved, that a laceration of this deſcription is exceedingly uncommon, and that the hernial ſac is produced by an elongation of the peritoneum. By reaſon of the continual diſtenſion and preſſure which the ſac ſuſtains from its contents, it often undergoes a gradual enlargement, particularly when the maſs of the protruded viſcera is from time to time receiving additions. In this manner immenſe hernial ſacs are ſometimes formed, extending to various diſtances down the thigh, and, in ſome inſtances, even to the knee.

It is remarked by Mr. Aſtley Cooper, that a long continued preſſure of moderate force will produce an elongation and thickening of fibre; but that a greater degree will bring about an entire abſorption of parts. This, he ſays, is proved, in the firſt caſe, by the vaſt increaſe of ſize and thickneſs which the tunica vaginalis undergoes in old hydroceles; and, in the ſecond, by the entire removal of the ſternum and cartilages of the ribs in aneuriſm. It is upon the firſt of theſe principles that the hernial ſac is thickened; for in ſome very large ruptures indeed, the preſſure upon the containing parts exceeds that degree which occaſions them to become thickened, ſo that they are affected with an oppoſite change, and grow thinner and thinner. This is the reaſon why, in ſome ruptures of vaſt ſize and long duration, the convolutions and periſtaltic motions of the bowels may be diſcerned through the integuments. It alſo explains why ſome herniæ are found in part without any hernial ſac, the chief portion of it having been abſorbed, ſo that the protruded viſcera lie immediately under the ſkin and cellular ſubſtance, while the remains of the ſac are only diſtinguiſhable juſt in the neighbourhood of its mouth.

While a hernia is ſmall, and in a moſt recent ſtate, that is to ſay, immediately after its firſt occurrence, the ſac is not adherent to the ſurrounding parts, and may be puſhed back into the abdomen. At the ſame time it ought to be well underſtood by ſurgeons, that very ſoon indeed after its protruſion, it becomes ſo intimately connected by adheſions with the parts about it, that every idea of getting it back into the cavity of the belly again is vain, ſince it can ſcarcely be ſeparated from its attachments by the knife of the anatomiſt in the dead ſubject. This difficulty of detaching the hernial ſac from the ſurrounding parts, eſpecially from the ſpermatic cord, will ever forbid the practice of trying to return the ſac into the abdomen, with a view of effecting a radical cure.

It is the covering of the ſac, and not the ſac itſelf, as we have already obſerved, which is chiefly thickened in old herniæ. It appears alſo probable, from Mr. Aſtley Cooper's obſervations, that if the accounts of ſtrictures being formed by a thickening of the neck of the ſac are not always miſrepreſentations, theſe caſes are, at all events, exceedingly rare.

In ſome ſubjects ſeveral hernial ſacs exiſt at the ſame time. The foregoing author has a preparation of two hernial ſacs in each groin, and of one in an incipient ſtate on the left ſide. In theſe caſes, the viſcera do not generally protrude into all the ſacs at the ſame time. (Cooper, part i. p. 3.)

Examples are recorded of hernial ſacs being burſt by blows. (See Supplement au Traité de J. L. Petit ſur les Mal. Chir. p. 113, and Cooper, part i. p. 3.) In this circumſtance the viſcera may project immediately under the ſkin, and muſt be returned into the ſac before there is a poſſibility of getting them back into the abdomen.

Although the ſtatement, that the prolapſed bowels are contained in a hernial ſac, formed by the peritoneum, is, generally ſpeaking, perfectly correct; yet it ought to be well known that there are a few exceptions to this obſervation. Were a practitioner, from ignorance of this circumſtance, to employ his knife with incautious boldneſs, the conſequences might be of the moſt fatal nature to his patient, and of the moſt diſgraceful kind to himſelf. Thoſe herniæ which occur through unnatural holes, left by the imperfect formation of the muſcles, are ſaid to be ſometimes without any covering of peritoneum. The hernia of the bladder has no hernial ſac, neither has the common congenital hernia. Such ruptures as occur after wounds of the abdomen, or return after the operation, or after the practice of ſome method for the deſtruction of the ſac, are alleged to be without any peritoneal inveſtment. The viſcera, in ſome umbilical herniæ, are aſſerted to have been deſtitute of a hernial ſac, though we are rather inclined to believe that accounts of this laſt kind are founded in miſtake, as will be hereafter more particularly noticed.

Cauſes of Herniæ.—Theſe are divided into the *exciting* and *prediſpoſing*. The principal exciting cauſes are ſuch as operate, either by diminiſhing the cavity of the abdomen and compreſſing the viſcera, or by increaſing the volume of the contents of the belly beyond what the reſiſtance of the containing parts can bear.

The abdominal viſcera may be conſidered as occupying a place where they are expoſed to the compreſſive action of ſome exceedingly powerful organs, namely, the diaphragm and abdominal muſcles. In the indiſpenſible and continual function of reſpiration, theſe muſcles are inceſſantly employed. Their action, however, is alternate; in inſpiration, the diaphragm propelling the viſcera downward, ſo as to enlarge the capacity of the cheſt, while the abdominal muſcles yield and make no reſiſtance; in expiration, the abdominal muſcles acting, ſo as to puſh up the viſcera and diaphragm, which is then paſſive, and thus aid in diminiſhing the cavity of the thorax. In the performance of the vital function of breathing, therefore, the abdominal viſcera are ſuſtaining a certain degree of compreſſion, which muſt incline them to protrude at any point where they are not ſufficiently ſupported by the parietes of the cavity in which they naturally lie. But there are occaſions on which the diaphragm and abdominal muſcles all act at once in compreſſing the bowels and leſſening the ſpace allotted for them. This being the ſtate of things, we muſt not feel ſurpriſed, that protruſions of the viſcera are among the moſt common diſeaſes of the human race.

Violent action of the abdominal muſcles, from whatever cauſe it may ariſe, may be accounted the moſt frequent occaſion of herniæ. Hence the diſeaſe is often brought on by

by exceſſive coughing, and is particularly common among perſons who play upon wind inſtruments, or who have long been troubled with aſthma. Lifting heavy weights is a thing, above all others, conducive to the complaint, ſince the muſcles of the abdomen exert themſelves with great force at a time when the body is bent, and the openings in the groins conſequently relaxed.

Coſtive perſons are alſo reckoned particularly ſubject to herniæ, becauſe they are compelled to ſtrain, and make the muſcles act with vaſt power on the bowels, before they can void their fæces. In the caſe of ſtraining, the diaphragm is firſt put into action by a deep inſpiration, and then the abdominal muſcles. The viſcera, compreſſed by theſe two forces, eſcape wherever the reſiſtance of the ſides of the abdomen is not equal to the degree of preſſure.

Herniæ are ſaid to be very frequently the conſequence of ſtrictures in the urethra, patients, afflicted with ſtoppages in this canal, being often under the neceſſity of exerting the abdominal muſcles with peculiar force, in order to be able to expel the urine.

Carrying heavy burdens, running, jumping, vomiting, parturition, and, in ſhort, almoſt every ſort of conſiderable effort and exertion, may prove the exciting cauſe of a hernia, by throwing the muſcles, which have the power of compreſſing the viſcera, into a ſtate of ſtrong and violent action. In this laſt circumſtance, a hernia may be formed in a perſon who is no way pre-diſpoſed to the diſeaſe; and with how much greater facility a rupture may occur, when there is a pre-diſpoſition, it is needleſs to dwell upon.

The ſame principles ſerve to explain why herniæ are obſerved to be particularly frequent among the labouring claſſes of ſociety, and the inhabitants of mountainous countries. The hooping-cough and crying are, for the ſame reaſon, not an uncommon occaſion of ruptures in children. See Lawrence on Hernia, p. 18. ed. 2.

We have ſtated that ſome of the exciting cauſes of herniæ operate by increaſing the volume of the contents of the belly beyond what the reſiſtance of the containing parts can bear. Thus, protruſions of the omentum and meſentery are often the conſequence of theſe parts becoming loaded with fat. When fatneſs comes on very ſuddenly, it is particularly apt to occaſion a rupture, the abdominal muſcles not being able to accommodate themſelves to the enlargement of the contents of the belly with ſufficient quickneſs.

The ſwelling of the uterus in pregnancy ſometimes gives riſe to herniæ, eſpecially thoſe of the umbilical and femoral kinds.

Blows and kicks upon the abdomen have been obſerved to excite hernial tumours. Rough horſe exerciſe, the jolting of carriages, and the preſſure of tight clothes around the body, are alſo noticed as promoting the frequency of the diſeaſe. Cooper, part i. p. 13.

The *prediſpoſing cauſes* are generally circumſtances which have a tendency to diminiſh the reſiſtance made by the parietes of the abdomen to the protruſion of the viſcera.

Weakneſs of every kind is accounted a very principal pre-diſpoſing cauſe of herniæ, and it is ſaid to become ſo by inducing a relaxed ſtate, not only of thoſe apertures through which the bowels uſually eſcape, but alſo a relaxation of the peritoneum, and all the proceſſes of it, which ſerve to confine the various viſcera in their reſpective ſituations, and limit their moveableneſs. Hence, perſons who have been debilitated by fevers are much expoſed to the danger of herniæ, if they ſubject themſelves to great bodily exertions before they have regained their ſtrength.

Old age is likewiſe conſidered as a pre-diſpoſing cauſe, by the general relaxation which it brings into the conſtitution; and hence the great frequency of the diſeaſe among ſuch old perſons as are obliged to labour hard for their livelihood.

Taking large quantities of oil with the food, living more upon liquids than ſolids, wearing too much clothing, and reſiding in warm climates, are all ſet down by ſurgical writers among the cauſes which pre-diſpoſe people to hernia on the principle of relaxation. We cannot venture to pronounce reſpecting the accuracy of ſome of theſe alleged circumſtances; but of the greater prevalence of ruptures in warm than cold climates, not the leaſt doubt can be entertained. Juville, a celebrated truſs-maker in Paris, found that the number of ſubjects with hernia was about one-thirtieth of the population in Germany, and the north of Europe; one-fifteenth in Italy and Spain; and one-twentieth in France and England. (Traité des Band. Hern. p. 21, 22.) In Malta and Egypt, the vaſt numbers of hernial tumours ſeen among the natives, have attracted the notice of all ſurgeons who have viſited thoſe countries.

Some perſons are, in all probability, born with a predиſpoſition to herniæ, in conſequence of having abdominal rings of a wider and weaker ſtructure than thoſe of people in general. The ſame may be the caſe alſo with reſpect to the other openings through which the abdominal viſcera ſometimes protrude. The difference in the dimenſions of the abdominal ring in the two ſexes ſeems to afford a rational explanation why inguinal herniæ are common in men, and uncommon in women; while the ſpace below Poupart's ligament in the latter, being greater than what it is in the former, offers a reaſon why females are moſt ſubject to the femoral hernia. In the male ſex, alſo, the reſiſtance which the abdominal ring is capable of making to protruſions of the bowels, muſt vary conſiderably in different perſons, according to the ſtrength of the parts concerned in ſhutting up that aperture.

A change of the body, from a very fat to a lean condition, is alſo enumerated among the pre-diſpoſing cauſes of hernia, and is thought to become ſo by the abſorption of the adipous matter which had loaded the ſpermatic cord, and diſtended the ring. (Cooper, part i. p. 12.) Here, perhaps, the principle of weakneſs and relaxation may have ſome ſhare in producing the effect.

Worms, which penetrate the cavity of the belly, are always included, by ſurgical writers, among the pre-diſpoſing cauſes of this diſeaſe. After the injury is healed, it ſeems that the part is incapable of affording the requiſite degree of ſupport, and a protruſion of ſome of the viſcera is of courſe a common conſequence.

A pre-diſpoſition to hernia is obſerved ſometimes to depend upon hereditary conformation. Mr. Aſtley Cooper informs us that he has frequently been conſulted by fathers, themſelves wearing truſſes, for ſeveral of their children afflicted with the diſeaſe. In ſuch caſes he found, by attentive examination, that the abdominal ring was very imperfectly formed, extending nearly as far as the ilium, inſtead of being only about an inch and a half in length. In theſe caſes, the tranſverſe tendinous fibres, which ſhut up the ſuperior margin of the ring, were either abſent, or very imperfect. Cooper, part i. p. 12.

Beſides the foregoing circumſtances, we have to mention dropſy as pre-diſpoſing to the occurrence of umbilical herniæ, probably by diſtending and dilating the natural aperture of the navel. Repeated pregnancy is, on a ſimilar principle, conducive to the formation of hernial diſeaſes.

We ſhall finiſh this account of the cauſes of ruptures with a ſhort quotation from a late matchleſs treatiſe upon the ſubject. "Particular ſubjects manifeſt an unqueſtionable

diſpoſition

diſpoſition to the complaint. In ſuch perſons, a very ſlight occaſional cauſe, ſuch as the act of coughing or ſneezing, will bring on a rupture. The complaint indeed appears ſometimes ſpontaneouſly. I know, ſays Richter, a ſavant, who leads a ſedentary life, and in whom an inguinal hernia appeared ſuddenly ſome time ago. I applied a bandage, and, in a few weeks, a ſimilar hernia came on the oppoſite ſide; a bandage was applied to this alſo; and in a very ſhort time a crural hernia made its appearance. I have ſeen ſeveral ſimilar caſes, and have known four, or even five herniæ come in the ſame ſubject, without the leaſt occaſional cauſe. (Traité des Hernies, p. 9.) The neceſſity of admitting ſome original difference of ſtructure, favourable to the occurrence of ruptures, is apparent from this conſideration, *viz.* that the openings exiſt in all ſubjects, and the occaſional cauſes are applied in all individuals; but the effect is only partial." Lawrence on Ruptures, p. 21. ed. 2.

Of Reducible Herniæ.—Under this head are comprehended ſuch as are in a quiet ſtate, and admit of being put back into the cavity of the abdomen without difficulty, or, indeed, often return of themſelves into that ſituation when the patient is in a recumbent poſture. The protruded parts commonly go up at night upon the patient lying down in bed, and come down again in the morning upon his getting up and reſuming an erect poſition.

The uſual ſymptoms of a reducible hernia, quite free from ſtrangulation, are of the following deſcription. An indolent tumour may be ſeen or felt at ſome point of the parietes of the abdomen, moſt frequently deſcending out of the abdominal ring, or from juſt below Poupart's ligament, or elſe out of the navel, but occaſionally from various other ſituations, as we have already mentioned. The ſwelling moſtly originates ſuddenly, except when that kind of pre-diſpoſition prevails, in which the diſeaſe ſeems to ariſe almoſt ſpontaneouſly, and to conſiſt of a gradual yielding of the containing parts. The tumour is generally ſubject to a change of ſize, being ſmaller when the patient lies down on his back, and larger when he ſtands up, or holds his breath. It frequently undergoes a diminution when preſſed, and grows large again when the preſſure is removed. Its ſize and tenſion often increaſe after a meal, or when the patient is flatulent. It is free from pain, inflammation, and diſcolouration of the integuments. Its contents, if omentum, betray a ſoft doughy feel; if inteſtine, the ſenſation communicated to the fingers of an examiner is frequently ſomewhat tenſe and elaſtic. It is alſo a circumſtance, highly meriting notice, that patients, with large reducible herniæ, are apt to be troubled with colic, conſtipation, and vomiting, in conſequence of the unnatural ſituation of the bowels. Very often, however, the functions of the viſcera ſeem to ſuffer little or no interruption.

In ſome inſtances, the reduction is attended with a degree of trouble, and requires the aid of preſſure. A perſon, in the foregoing condition, lives in a conſtant ſtate of danger. Any accidental fall, violent effort, or ſlight inattention to the ſtate of the bowels, is apt to produce a ſtrangulation of the prolapſed parts, the conſequences of which change are fatal, without ſpeedy and judicious aſſiſtance.

If the caſe be an *enterocele*, and the portion of inteſtine be ſmall, the tumour is ſmall in proportion; but though ſmall, if the gut be diſtended with wind, inflamed, or have any degree of ſtricture made on it, it will be tenſe, reſiſt the impreſſion of the finger, and give pain upon being handled. On the contrary, if there be no ſtricture, (which is the caſe we are immediately conſidering,) and the inteſtine ſuffers no degree of inflammation, let the prolapſed piece be of what length it may, and the tumour of whatever ſize, yet the tenſion will be little, and no pain will attend the handling of it; upon the patient's coughing, it will feel as if it were blown into; and, in general, it will be found very eaſily returnable, a guggling noiſe being often audible, when the bowel is aſcending.

If the hernia be an *epiplocele*, or one of the omental kind, the tumour has a more flabby, and a more unequal feel; it is in general perfectly indolent, is more compreſſible, and, if in the ſcrotum, is more oblong, and leſs round, than the ſwelling occaſioned by an inteſtinal hernia in the ſame ſituation; and if the quantity be large, and the patient adult, it is, in ſome meaſure, diſtinguiſhable by its greater weight. A piece of omentum in general paſſes up very ſlowly, and never makes a guggling noiſe.

If the caſe be an *entero-epiplocele*, that is, one conſiſting of both inteſtine and omentum, the characteriſtic marks will be leſs clear than in either of the ſimple caſes; but the diſeaſe may eaſily be diſtinguiſhed from every one, by any one in the habit of making the examination. See Pott on Ruptures.

It muſt be acknowledged, however, that it is often difficult, and even impoſſible, to aſcertain what are the contents of the hernia, by merely handling the ſwelling. This is more eſpecially the caſe when the hernia is old, large, and tenſe. In ſuch inſtances the protruded viſcera undergo ſurpriſing changes in their figure and ſtructure, while the thickneſs of the hernial ſac tends materially to impede the acquirement of any accurate information, as to the nature of its contents, by the fingers of an examiner. It is often equally difficult to form a right opinion in regard to what is contained in a ſmall hernia.

In caſes of indolent reducible herniæ, a piece of inteſtine is generally found to paſs up into the abdomen with more facility than a portion of omentum. This circumſtance is ſaid to be owing to the very ſmooth and ſlippery ſurface of the inteſtine. On the other hand, the omentum, being ſoft and unequal, and having its ſurface moulded by the contiguous parts, paſſes up with more difficulty. Hence, when a portion of the contents of a hernia ſlips up quickly, and with a guggling noiſe, leaving ſome thing behind, which is leſs eaſy of reduction, it is reaſonable to infer, that the diſeaſe is, in all probability, an entero-epiplocele. See Lawrence on Ruptures, edit. 2. p. 28.

Nothing is more common, than to ſee perſons with indolent reducible herniæ walking about, and following their wonted avocations, with the tumours down, expoſed to every ſort of accident, and totally unſupported. Since no preſent pain, nor any immediate conſiderable inconvenience, is experienced, all idea of what may be the conſequences of the hernia is too often quite out of the mind; nor does, in many inſtances, a juſt ſenſe of the manner, in which ſuch patients are continually expoſed to peril, have the leaſt effect, either in making them pay due attention to the diſeaſe, or in leading them to obſerve as quiet, temperate, and regular a mode of living, as their circumſtances in life might permit.

That the protruſion of any part of the viſcera from the cavity of the abdomen renders a perſon particularly expoſed to the danger of an additional quantity of the viſcera becoming alſo protruded, and probably ſtrangulated, is an important truth, which cannot be too deeply impreſſed upon the memory of both patient and ſurgeon. While a prolapſed bowel is ſuffered to remain ſo, it keeps the mouth of the hernial ſac always open, and ready to receive any additional protruſion. Therefore, every perſon afflicted with a reducible hernia, ought to have the danger of ſuffering it to continue down properly explained to him by his ſurgeon, who ſhould alſo repreſent the prudence and neceſſity of never

ver neglecting to wear a truſs. By this a conſtant preſſure is to be applied to the part, where the hernia opens into the abdomen, ſo as to ſhut the mouth of the ſac, and thus make an effectual reſiſtance to the protruſion of its contents.

Herniæ, which are capable of eaſy and immediate reduction, and are not attended by any troubleſome, or bad ſymptoms, are often met with both in infants and adults. "In the former," ſays Mr. Pott, "as the deſcent ſeldom happens, but when the infant ſtrains to cry, and the gut is either eaſily put up, or returns *ſuâ ſponte*, as ſoon as the child becomes quiet, it is often either totally unattended to, or an attempt made to reſtrain it only by a bandage made of cloth, or dimity, and which being ineffectual for ſuch purpoſe, lays the foundation for future trouble and miſchief.

"This is, in great meaſure, owing to a common opinion, that a young infant cannot wear a ſteel truſs: a generally prevailing error, and which ought to be corrected. There is no age at which ſuch truſs may not be worn, or ought not to be applied; it is, when well made, and properly put on, not only perfectly ſafe and eaſy, but the only kind of bandage that can be depended upon: and as a radical cure depends greatly on the thinneſs of the hernial ſac, and its being capable of being ſo compreſſed as poſſibly to unite, and thereby entirely cloſe the paſſage from the belly, it muſt therefore appear to every one who will give himſelf the trouble of thinking on the ſubject, that the fewer times the parts have made a deſcent, and the ſmaller and finer the elongation of the peritoneum is, the greater the probability of ſuch cure muſt be.

"The ſame method of acting muſt, for the ſame reaſons, be good in every age in which a radical cure may reaſonably be expected; that is, the prolapſed parts cannot be too ſoon returned, nor too carefully prevented from falling down again, every new deſcent rendering a cure both more diſtant and more uncertain.

"As ſoon as the parts are returned, the truſs ſhould be immediately put on, and worn without remiſſion, care being taken, eſpecially if the patient be an infant, to keep the parts on which it preſſes conſtantly waſhed, to prevent galling.

"It can hardly be neceſſary to ſay, that the ſurgeon ſhould be careful to ſee that the truſs fits, as his ſucceſs and reputation depend on ſuch care. A truſs which does not preſs enough, is worſe than none at all, as it occaſions loſs of time, and deceives the patient, or his friends; and one which preſſes too much, or on an improper part, gives pain and trouble, by producing an inflammation and ſwelling of the ſpermatic cord, and ſometimes of the teſticle.

"In adults, whoſe ruptures are of long ſtanding, and accuſtomed to frequent deſcent, the hernial ſac is generally firm and thick, and the aperture in the tendon of the abdominal muſcle large; the freedom and eaſe with which the parts return into the belly, when the patient is in a ſupine poſture, and the little pain which attends a rupture of this kind, often render the perſons who labour under it careleſs: but all ſuch ſhould be informed, that they are in conſtant danger of ſuch alteration in their complaint, as may put them into great hazard, and perhaps deſtroy them. The paſſage from the belly being open, the quantity of inteſtine in the hernial ſac is always liable to be increaſed, and when down to be bound by a ſtricture. An inflammation of that portion of the gut which is down, or ſuch obſtruction in it as may diſtend and enlarge it, may at all times produce ſuch complaints as may put the life of the patient into imminent danger; and therefore, notwithſtanding this kind of hernia may have been borne for a great length of time, without having proved either troubleſome or hazardous, yet as it is always poſſible to become ſo, and that very ſuddenly, it can never be prudent or ſafe to neglect it.

"Even though the rupture ſhould be of the omental kind, (which conſidered abſtractedly is not ſubject to that degree or kind of danger to which the inteſtinal is liable) yet it may be ſecondarily, or by accident, the cauſe of all the ſame miſchief; for while it keeps the mouth of the hernial ſac open, it renders the deſcent of a piece of inteſtine always poſſible, and conſequently always likely to produce the miſchief which may proceed from thence.

"They who labour under a hernia thus circumſtanced, that is, whoſe ruptures have been generally down while they have been in an erect poſture, and which have either gone up of themſelves, or have been eaſily put up in a ſupine one, ſhould be particularly careful to have their truſs well made, and properly fitted; for the mouth of the ſac, and the opening of the tendon being both large and lax, and the parts having been uſed to deſcend through them, if the pad of the truſs be not placed right, and there be not a due degree of elaſticity in the ſpring, a piece of inteſtine will, in ſome poſture, ſlip down behind it, and render the truſs productive of that very kind of miſchief which it ought to prevent.

"It is ſcarcely credible how very ſmall an opening will ſerve for a portion of gut or caul to inſinuate themſelves into at ſome times. Now, though in perſons of mature age it moſt frequently proves impracticable ſo to compreſs the mouth of the hernial ſac, as abſolutely to cloſe it, yet by the conſtant uſe of a well-made truſs, it may be ſo leſſened, as to render the deſcent of a piece of inteſtine into it much more difficult: from whence we may learn the great conſequence of having the part completely reduced before the truſs is applied, and the danger that may be incurred by laying ſuch bandage aſide after it has been worn ſome time; ſince the ſame alteration which renders the deſcent of the gut leſs eaſy, will alſo make the reduction more difficult, if a piece ſhould happen to get down: and hence alſo we may learn why the bandage ſhould be long and unremittingly worn by all thoſe whoſe time of life makes the expectations of a perfect cure reaſonable, many of the ruptures of adults being owing to the negligent manner in which children at ſchool are ſuffered to wear their truſſes.

"I know a gentleman who has for ſome years had an omental rupture, which was neglected while he was young, and he having naturally a lax habit, and the abdominal opening being much dilated, he finds it extremely difficult to keep it up, even with the beſt truſs he can get, behind which it will ſometimes ſlip down: when this happens, it gives him ſuch immediate and acute pain at his ſtomach, and makes him ſo intolerably ſick, that he is obliged immediately to throw himſelf on his back, and procure the return of the piece of omentum." See Pott on Ruptures.

The preceding obſervations are truly worthy of the great and diſtinguiſhed ſurgeon who is the author of them. This, and ſeveral other parts of his treatiſe on ruptures, will always ſtand high in the eſtimation of the ſurgical profeſſion. Much we owe to ſome later writers for the manner in which they have extended and improved our information, concerning hernial diſeaſes; yet, in no book can we find more knowledge of the right practical kind, than ſtill exiſts in Pott's account of ruptures. The defect of this part of his writings principally lies in ſome anatomical points, which have ſubſequently been rendered more correct by the united obſervations of Gimbernat, Mr. Hey, Mr. Aſtley Cooper, and Mr. Lawrence.

But, to return to the ſubject of reducible herniæ, it behoves every ſurgeon to underſtand, that though theſe caſes are attended with no immediately preſſing ſymptoms, they ſometimes occaſion conſiderable trouble, eſpecially when neglected, and nothing is done to check their becoming of immenſe ſize. The degree of inconvenience, in fact, always increaſes with the ſize of the tumour. The portion of inteſtine, or omentum, which has quitted the abdomen, produces (as Mr. Lawrence deſcribes) various complaints from its connection with the parts within. From this ſource of irritation proceed nauſea and vomiting, indigeſtion and colic. As the viſcera become accuſtomed to their unnatural ſituation, theſe ſymptoms gradually wear away. Still, as the tumour conſtantly increaſes in ſize, a large part of the viſcera is deprived of that preſſure and ſupport which it naturally derives from the reſpiratory muſcles; the paſſage of the food through the alimentary canal becomes difficult and protracted; and hence large ruptures are almoſt invariably attended with flatulence and conſtipation. The patient is precluded from all active and laborious employments, and from all conſiderable exertions which neceſſarily augment the tumour, and are attended with great riſk of more immediate danger, by forcing down freſh parts, ſo as to cauſe ſtrangulation. The opening through which the viſcera paſs out, muſt ſubject them to more or leſs preſſure, which will enable us to account for that effuſion of fluid into the cavity of the ſac, generally obſerved in old ruptures, as well as for the formation of ſuch adheſions of the parts to each other, and to the hernial ſac; circumſtances changing the caſe from a reducible to an irreducible ſwelling. As the opening is rendered larger by the protruſion of the parts, and the preſſure on the viſcera, which cauſes the deſcent, is frequently renewed, additions to the tumour are eaſily made. In ſituations where poſition is favourable, and the ſurrounding parts offer no obſtacle, as in the ſcrotum, the only limit to the poſſible bulk of a rupture ariſes from the connections of the parts within. Inſtances are not uncommon where all the moveable viſcera have been contained in ſuch a ſwelling; and even thoſe which are more fixed may be gradually diſplaced by the conſtant dragging of organs connected with them. See Lawrence on Ruptures, p. 31, 32. edit. 2.

Of Truſſes.—We have endeavoured to repreſent the imprudence of ſuffering the parts, which form the contents of a hernia, to lodge in the hernial ſac, when they are capable of reduction. In this circumſtance, they ought always to be returned into the cavity of the belly with as little delay as poſſible, and conſtantly kept there by means of a truſs. A perſon may have a hernia, and allow its contents to deſcend into the ſac, perhaps without any preſent inconvenience; but the perils and diſagreeable circumſtances which may be the conſequence of ſuch temerity, ought to frighten him into a different line of conduct. The quiet harmleſs ſtate of the protruded viſcera is not at all to be depended upon, being of very uncertain continuance. Many things may lead to a change, in which the patient's life will be brought into the moſt imminent danger. Any exertion which occaſions an additional protruſion; any ſlight blow on the tumour; any intemperance in diet; may ſuddenly convert a ſimple, reducible, indolent hernia, into a caſe attended with all the alarming, and often fatal ſymptoms, which proceed from the ſtrangulation of the protruded parts. But, ſuppoſing the patient to eſcape theſe evils for a great length of time, other unpleaſant things will be the reſult of his raſh neglect. The hernia, as we have already deſcribed, will continue to grow larger and larger, until its magnitude is ſuch, as interferes with the exerciſe of any active kind of life, is accompanied with a protruſion of all the moveable viſcera of the abdomen, and brings on afflicting diſorders of the functions of the various parts. Even the pylorus of the ſtomach has been found dragged into the mouth of a hernial ſac.

The effect of every eligible truſs, or bandage for ruptures, is to produce an adequate, unremitting, equal degree of preſſure upon the part where the hernia opens into the abdomen, ſo as to ſhut up the paſſage through which the parts eſcape from the cavity in which they are naturally contained. No reaſonable expectation can be indulged, that any contrivance will operate in this manner, unleſs the preſſure which it makes is uninterrupted, and of ſufficient power, being alſo ſuch as will not induce any complaints which might oblige the patient, for a certain time, to deſiſt from wearing the apparatus.

All bandages for ruptures are either elaſtic, or inelaſtic. The laſt are uſually made of dimity or leather. They are by no means fit for common uſe. In conſequence of the continual change which is taking place in the dimenſions of the abdomen, in expiration and inſpiration, ſuch bandages are neceſſarily rendered now too ſlack, and now too tight; and ſince the viſcera are liable to be protruded, on the paſſage being left in the leaſt open, it is quite obvious that, in truſting to any inelaſtic apparatus, the patient puts his life into great danger. This peril will always be ſtill more conſiderable, in proportion as the perſon is in an active mode of living. The inefficacy of the bandage is ſoon perceived by the patient himſelf, who endeavours to make its operation more availing by tightening it. But this is not only apt to bring on pain and ſwelling of the teſticles, (ſuppoſing the caſe to be an inguinal hernia,) but the ſame affection of the external parts, to which the bandage is applied. Theſe circumſtances compel the patient to diſcontinue its employment, till the complaints which it has occaſioned have had time to ſubſide. Now, nothing is more dangerous than even leaving off any kind of contrivance deſigned to keep the contents of a reducible hernia within the abdomen. In Germany, where inelaſtic bandages are much uſed, Richter has ſeen a ſwelling of the teſticle, cirſoceles, and hydroceles, ariſe from their employment.

We have already delivered Mr. Pott's ſentiments, with reſpect to the propriety of applying ſteel truſſes to infants. Such inſtruments are as much calculated for them as for adults, and the opinion to the contrary is totally deſtitute of foundation.

All inelaſtic bandages for the ſupport of herniæ are now juſtly regarded as only affording a falſe ſecurity, more dangerous even than a total omiſſion of this kind of ſupport, ſince they encourage the patient to take violent exerciſe, without apprehenſion of the probable conſequences. Cooper, part i. p. 14.

The only way in which any apparatus of this kind may be uſeful in caſes of ruptures, is as a ſuſpenſory bandage, when the hernia does not admit of being reduced in conſequence of adheſion, &c. Here it may be very ſerviceable in ſupporting the parts, and preventing the hernia from acquiring a vaſt and dangerous magnitude. Elaſtic bandages for hernia, or (as they are commonly called) truſſes, may be ſo made as always to act with an equal unremitting force in every attitude of the body. When the abdomen riſes, they yield by reaſon of their elaſticity; and when it ſinks down, the ſame property ſtill keeps them in contact with its ſurface. The moſt important part of a common truſs conſiſts of a flat narrow piece of ſteel, termed the *ſpring*, which goes round one-half of the body, the anterior end extending to the abdominal ring, the poſterior reaching beyond the

the ſpine. To give the ſpring a proper degree of elaſticity has always been looked upon as a matter of the higheſt conſequence. It has been alleged that ſteel is too hard, and iron too ſoft for the purpoſe, and, therefore, Arnaud and Richter have recommended making the ſprings of a mixture of ſteel and malleable iron. However, this advice is now deemed objectionable, and it is univerſally acknowledged in this country, that as the ſpring cannot be made too elaſtic, the beſt ſteel is what ſhould be employed for its conſtruction. Much of the power of the ſpring muſt manifeſtly depend upon the thickneſs of the piece of ſteel. When the patient leads an active life, and has a rupture which it is difficult to keep up, as is often the caſe with omental ruptures, and large old herniæ with great dilatation of the abdominal ring, a ſtrong ſpring will be neceſſary, and, of courſe, the plate of ſteel ſhould be ſomewhat thicker than in other inſtances. In children, and perſons who lead ſedentary lives, a weaker ſpring will ſuffice.

A great deal will depend upon making the ſpring fit cloſely upon every part of the body, ſo as to leave no hollow under the ſteel, which ſhould be adapted to all prominences and depreſſions.

The anterior end of the ſpring terminates in an expanded plate of iron called its *head*, to which it is rivetted. This latter part has its poſterior ſurface furniſhed with a cuſhion, termed the *pad*, and adapted in ſize and ſhape to the opening which it is intended to cloſe. Now, if the pad of the truſs does not fit cloſely, no preſſure will be made upon the aperture through which the viſcera are ready to paſs, and, conſequently, a protruſion is liable to happen. When any other part of the truſs does not apply itſelf accurately to the ſurface of the body, the whole inſtrument will not fit with ſufficient firmneſs, and will be apt to ſlip. Beſides, when a truſs makes more preſſure in one place than another, it is likely to be productive of pain.

A truſs, properly ſuited for every particular caſe, may be obtained, either by making the patient try on ſeveral already conſtructed, and chooſing one which fits well; or by having one made from the patient's meaſure. The beſt thing for taking ſuch meaſure, is a piece of flexible wire, doubled and twiſted, which will take and retain the neceſſary curvatures. According to Richter, however, it is proper to let the meaſure by the wire be an inch longer than appears requiſite, as the ſtuff uſed for covering the ſpring makes this allowance neceſſary. Above all things, it is eſſential to give a proper degree of curvature to that part of the ſpring which forms the middle of the ſemi-circle, and which, when the truſs is put on, ſurrounds the os ilium. When the circle, which it deſcribes, is too ſmall, the head of the truſs will not fit with due cloſeneſs upon the abdominal ring, and the patient will not be in a ſtate of ſecurity. When the circle is too large, the truſs will not fit cloſely upon the hip, and will be likely to change its ſituation. The preſſure, which is made by the pad of the truſs upon the abdominal ring and neck of the hernial ſac, ſhould be in a direction obliquely upwards, eſpecially upon patients who are very fat. Hence, the lower margin of the front plate of the ſemi-circular ſpring ought to incline a little inwards, ſo as to turn its inner ſurface obliquely upwards. By this means, an equal preſſure will be made upon every point of the abdominal ring. When the plate of the truſs has a perpendicular conſtruction, and conſequently preſſes upon the ring in an horizontal way, the preſſure is greater above than below, and an opportunity is left for the bowels to be protruded through the lower part of the ring. The poſterior end of the ſpring, which is applied to the ſpine, muſt have a contrary inclination, that is to ſay, the upper edge of the back part of the ſteel muſt incline ſomewhat more forwards than the lower one, whereby the inner ſurface will be turned forwards and a little downwards. When this part of a truſs is made in a perpendicular manner, its lower edge generally makes more preſſure than the upper one, and the place which is preſſed upon is rendered ſore and painful.

Some are of opinion, that the ſpring of a truſs ſhould be no more than a ſemi-circle, the forepart of which ſhould be upon the abdominal ring, while the poſterior end lies upon the ſpine. Others have been in favour of making the ſpring of ſuch a length, that its back end may extend over the ſpine, and reach as far as the front edge of the os ilium of the ſound ſide. It is alſo alleged, that a truſs of this conſtruction fits more ſteadily, and is capable of making more effectual preſſure. (Camper, Mem. de l'Acad. de Chirurgie, t. 15, p. 57.) Richter, however, expreſſes his inability to comprehend how a long ſpring can make more preſſure than a ſhort one, and, indeed, when inelaſtic iron was uſed, it could not. The inelaſtic iron ſemi-circle had its two fixed points of action; one was upon the abdominal ring, the other upon the ſpine. Theſe two points, being oppoſite to each other, were, with ſuch a ſpring, more advantageous than any others. But there can be no doubt, that when the ſpring is made of highly tempered elaſtic ſteel, the length of this part of the truſs increaſes its power of making preſſure. We do not mean, however, to ſay, that Camper's advice upon this point ought to be adopted. A truſs, with ſo long a ſpring, might be objectionable; for when the patient lies upon the ſound ſide, he would certainly preſs the whole inſtrument towards the other ſide, ſo as to create a riſk of the pad of the truſs being puſhed away from the abdominal ring. Such a truſs muſt alſo be particularly inconvenient to the patient.

In order that a truſs may fit in a ſteady manner, it is neceſſary that it be applied round fixed immoveable points. Of this deſcription are the ſacrum and the os ilium. Were the inſtrument applied to the ſoft parts of the abdomen above the pelvis, which parts afford no fixed points, it would never continue in the ſame poſition. A truſs likewiſe ought always to be put on in ſuch a manner, that it may paſs round the os ilium. At the ſame time, it ſhould not reach ſo low as to touch the trochanter major, as it would then be ſubject to diſturbance from every motion of the thigh. When the ſpring is arranged at a proper height for avoiding the trochanter major, it is obvious, that if its anterior end were to run forward in a ſtraight horizontal direction, the pad of the truſs would be ſo high as to be incapable of covering the lower part of the abdominal ring. Hence, that part of the ſpring which is behind and next to its head, and which has been called the neck of the truſs, has ſometimes been made with an angle, which carries the head of the truſs ſomewhat lower, ſo as to apply itſelf properly to the abdominal ring. Camper has found fault with this kind of conſtruction, and aſſerts, that it makes the head of the truſs liable to be puſhed upwards too far. His advice is, let the neck of the inſtrument have a courſe ſtraight forwards. But, according to Richter, with a truſs of this kind, two defects can hardly be avoided. He obſerves, that when the truſs is put on high enough to be clear of the trochanter major, the pad will not cover the lower part of the abdominal ring. On the other hand, when it is ſo applied, as to make its pad properly cover this opening, the body of the truſs will be ſo near the trochanter as to be affected by its motions.

Notwithſtanding a truſs may be made according to the foregoing rules, and fit very cloſely, its head will ſometimes ſlip about. In fat perſons, whoſe bellies project much, it is

apt to ſlip down; in lean people, it readily gets up too high. The latter change is the worſt, as the lower part of the ring thereby becomes unguarded, the very place where a protruſion of the viſcera is moſt diſpoſed to occur. The ſlipping of the pad of the truſs upward, however, may be eaſily prevented by the application of a thigh-ſtrap, which generally paſſes from the middle of the ſpring, under the thigh of the affected ſide, and is faſtened to the head of the truſs. When, as is often the caſe, the thigh-ſtrap is found to incommode the patient exceedingly, it may at all events be diſpenſed with, provided care be taken to hinder the aſcent of the pad of the truſs by having the hook, to which the body-ſtrap is faſtened, placed at the upper part of the pad of the truſs, or upon the angle of the neck, which is ſtill higher. So, alſo, in the oppoſite caſe, in which the pad of the truſs has a tendency to ſlip too far down, the inconvenience may be obviated by placing the hook at the loweſt part of the plate of iron.

The ſpring of the truſs is commonly covered with ſoft leather, while its inner ſurface, which comes into contact with the patient's body, is lined with thick flannel, between which and the metal wool is ſometimes put, in order to prevent any chafing or painful preſſure. As leather readily imbibes perſpiration, and thereby becomes ſpoilt, a propoſal has been made to cover truſſes with hare-ſkin, with the hair outwards. This covering is ſaid to be more durable, and to be better capable of reſiſting the effect of perſpiration. This appears to us an improvement of conſequence, becauſe the employment of any covering, which ſoon wears out, obliges the patient, every now and then, to leave his truſs off, for the ſake of getting it repaired, ſo that he becomes expoſed to the danger of leaving the mouth of the hernial ſac open.

Upon the inner ſurface of the anterior plate of the truſs is placed the pad, which is to be made of ſomething ſtuffed with hair or wool. The inſide of the pad ſhould have a ſlightly excavated ſurface, and be neither too hard nor too ſoft. When it is too ſoft, the preſſure which it makes is too feeble; and when its hardneſs is beyond the proper degree, it is apt to injure the ſpermatic cord, and does not apply itſelf accurately to the ſurface of the part to which it is applied. In the Journal de Medecine, tom. 36, a propoſal has been made to uſe a bladder, ſtrongly diſtended with air, as a pad, inſtead of one made of wool. Such a contrivance, however, does not ſeem likely to continue long ſerviceable, as the bladder would, in all probability, ſoon become flaccid. When the ſurface of the pad is too convex or conical, which is a very common defect, its prominent central part makes ſtrong preſſure, while, on the other hand, the ſides lie hollow, ſo that the bowels are apt to protrude, eſpecially when the pad ſlips in the leaſt. The preſſing power of the whole apparatus operates principally at the point of the conical inner ſurface of the pad, and not properly in other places. Hence the preſſure is very likely to be productive of pain and uneaſineſs. On the contrary, when the inner ſurface of the pad is flat, the truſs, though endued with conſiderable elaſtic force, will not create any unpleaſant ſenſations, becauſe the preſſure of the pad will be made upon a ſpace of greater extent, or, in other terms, upon a greater number of points. Beſides, a conical pad preſſes inward the margins of the abdominal ring, and tends to keep this opening continually dilated, ſo as rather to facilitate the occurrence of a hernia than promote its radical cure.

The larger and older the hernia is, the wider and more open is in general the abdominal ring. In ſuch a caſe, therefore, the pad of the truſs muſt be made large, in order that it may cover and ſhut up the whole of the ring. The ſize of the pad, indeed, ſhould always, in ſome meaſure, be regulated by that of the hernia. A ſmall pad is alſo ſubject to the defect of eaſily ſlipping out of its proper place, whereby the danger of a protruſion through the ring is produced. Let it not be inferred, however, that a truſs is always better, and that the hernia muſt certainly be more ſecurely kept up, in proportion as the pad is larger. For the greater its ſize, the more numerous are the points on which its preſſure is divided, and, conſequently, the weaker ſuch preſſure muſt be. "It is eaſier," ſays Richter, "to keep up a hernia with two of our fingers, than with the whole palm of the hand." When the pad is much too large, it touches the thigh, by the motions of which it is puſhed about, ſo as not only to create a riſk of the hernia deſcending, but to fret and irritate the part of the ſkin which it rubs.

A truſs, according to Richter, ought always to be applied in ſuch a manner, that, at leaſt, the lower third of the pad ſhould lie upon the os pubis, and cloſe the neck of the hernial ſac, while the upper part ſhuts up the abdominal ring. The preſſure, which is made againſt the os pubis, is the moſt material, as it operates againſt a fixed point, and has the effect of rendering the neck of the hernial ſac impervious. Since the ſoft parts yield and give way, Richter thinks all preſſure upon them cannot be truſted. He cenſures ſuch practitioners as are in the habit of applying the truſs, ſo as to make its pad only preſs upon the abdominal ring, and merely touch the os pubis with its lower edge. He ſtates, that by the deſcent of the viſcera, from the cavity of the abdomen, into the hernial ſac, the lower angle of the abdominal ring becomes drawn down, ſo far as to be ſituated cloſe to the os pubis; and, conſequently, he maintains, that when the lower edge of the pad merely touches the upper margin of the os pubis, the abdominal ring is not ſufficiently, nor ſecurely covered, being apt to be left unguarded, whenever the pad ſlips in the leaſt upwards. In fat ſubjects, the pad would not long remain in this ſituation, as it would be forced downward by the projection of the parietes of the abdomen above it.

On perſons who are neither too fat nor too thin, and have not too prominent a pubes, when a truſs is applied according to the preceding directions, it will be found, that the pad does not make too much preſſure upon the os pubis, while it makes effectual preſſure upon the abdominal ring. However, there are ſome patients, in whom this opening lies in ſuch a depreſſion, and the os pubis is ſo prominent, that the pad of the truſs makes too little preſſure on the ring, but far too much on the bone. In this ſort of caſe, a tranſverſe furrow may be made at the lower part of the pad, by which means its preſſure upon the os pubis will be diminiſhed, while that upon the ring is rendered more powerful. Some herniæ are met with, eſpecially epiploceles, which are very difficult to be retained in the abdomen, and can only be ſo by a very ſtrong truſs, which is apt to excite pain and ſwelling of the ſpermatic cord. In this caſe a grooved ſort of pad is ſaid to prove highly ſerviceable.

When a patient is afflicted with a hernia in each groin, it is cuſtomary to direct him, either to wear two diſtinct truſſes, the pads and back ends of which are joined together with ſtraps and buckles; or to wear a truſs which is provided with two pads. (See Surgical Plates.) The double truſs is generally found to be very inconvenient, and, therefore, a ſingle one with two pads is moſtly had recourſe to. Since, in this inſtance, a double degree of preſſure is requiſite, the ſpring of the truſs ſhould always be ſtronger than that for ordinary caſes. As the pad, ſituated next to the

the ſpring, always makes more preſſure than the other one; the ſpring of the truſs ſhould invariably be put on that ſide, where the hernia, which it is moſt difficult to keep up, is ſituated. Should one hernia be an enterocele, the other an epiplocele, the ſpring ought to be applied on the ſide on which the latter rupture is ſituated, becauſe an omental hernia is generally more difficult to be retained in the abdomen, than one of the inteſti al kind. The part of the inſtrument, which unites the two pads, ought to form an angle outwards. The two rami of the oſſa pubis do not make a ſtraight line in the place of their junction, but an angle, and it is to this angle, that the one made in the truſs, between the two pads, ought to be adapted. Were this part of the apparatus ſtraight, or not ſufficiently hollow, the pad, fartheſt from the ſpring, could not touch the parts underneath as it ought to do, nor, of courſe, make effectual preſſure.

The pad of a truſs ought to lie upon the ſurface, to which it is applied, in ſuch a manner, that it will make an equal preſſure upon every point of ſuch ſurface. When the upper part of the pad makes more preſſure than the lower, a pain is produced above, and the hernia protrudes below. When its lower edge preſſes more forcibly than the upper part, the ſpermatic cord is injured below, and a protruſion of the viſcera may occur above: ſimilar evils may enſue, when one ſide of the pad preſſes much more than the other. Hence, it is an object of great importance to have a pad of a flat conſtruction, ſo that, when it is applied, and an attempt is made to puſh a finger under it, an equal reſiſtance is encountered on every ſide. Truſſes are alſo fabricated with pads, which admit of being turned in various directions by means of a ſcrew, and of being fixed in any poſition, which may be thought moſt proper, by means of a catch.

Richter ſtates, that although a truſs, made upon this principle, is not to be entirely rejected, yet the pad is only capable of one kind of motion, namely, that in which its inner ſurface is turned either more upwards or downwards. Though, by this means, the pad may be ſo arranged, that its lower part will not make more preſſure than its upper. Richter contends, that this is not enough, and that we ought alſo to be able to turn the pad, in ſuch a manner, that one ſide will not preſs more forcibly than the other. Such power, however, is not afforded, the pad not being capable of moving to either ſide. We obſerve, that this ſurgical author gives a preference to making the hoop of the truſs with iron, which will admit of being bent, ſo as to make the pad take the exact poſition which may be wiſhed. He does not appear to have a proper conception of the advantages to be derived from making the ſprings of truſſes of highly tempered ſteel, in order that they may poſſeſs more elaſtic power. Therefore, we cannot be ſurpriſed, that he ſhould betray a prejudice to truſſes, which have pads moveable by means of ſcrews, &c. He fancies, that his flexible iron hoops, which give him a certain power of altering the poſition of the pad *in almoſt any way*, remove all occaſion for moveable pads, which alſo can only be moved in the *limited* manner already mentioned. However, ſince highly elaſtic ſprings have been accounted the beſt, by all the moſt eminent ſurgeons of the preſent time; the uſe of pads, which admit of having their poſition altered with a ſcrew, ſeems to promiſe advantages in particular caſes. Thoſe truſſes, which Richter alludes to, are certainly imperfect, inaſmuch as their pads do not admit of being moved in every direction. We think, however, we have ſeen pads in this country, ſo contrived, as to allow of being moved, without ſuch limitation, as that which Richter deems a ground of imperfection. We know that there are caſes, which may be ſerved by truſſes made upon this principle, and, therefore, we do not hetitate to pronounce them to be deſerving of more praiſe than Richter has been willing to give them.

When once a perſon has been obliged to wear a truſs, he ought never to leave it off, if he has any deſire to avoid conſiderable peril, and not to loſe, in an inſtant, the chief advantage reſulting from the employment of the inſtrument. The conſtant preſſure of the pad, upon the neck of the hernial ſac, ſometimes excites adheſions in it, or even a total obliteration of its cavity, whereby a radical cure of the diſeaſe is accompliſhed. Now, when a patient, after wearing a truſs a certain time, lays it aſide, even for the ſpace of a few moments, an opportunity is afforded for the viſcera to deſcend again, and they may unfortunately do ſo, ſhort as the omiſſion of the truſs may have been. When this happens, the freſh protruſion may deſtroy whatever degree of cloſure may have taken place in the neck of the ſac; the obliteration of the paſſage may be for ever prevented; and thus the patient, in an inſtant, may be deprived of the benefit, which perhaps has been the effect of his having worn a truſs for ſeveral years before. But the greateſt misfortune is, that the hernia, in becoming prolapſed again, is exceedingly apt to be ſtrangulated, by reaſon of the alterations made in the hernial ſac and its neck, ſince a former deſcent of the viſcera into them. If the patient is obliged, by ſome urgent cauſe, to take off his truſs for a time, let him be careful to do it in a recumbent poſition, and refrain from getting up upon his feet, till the ſame truſs or another ſuitable one is applied. On this account, it is always a prudent thing to have two proper truſſes, ſo that one may be conſtantly ready for uſe, when the other ſtands in need of any alteration or repairs. At night in bed, where the body is in an horizontal poſture, the hernia is in general not much diſpoſed to be protruded. Hence at firſt, while the patient is not yet habituated to a truſs, permiſſion may be given him to leave it off upon his going to bed in the evening. But as ſoon as he has been ſomewhat accuſtomed to the inſtrument, he will not mind it much, and he ſhould be adviſed to wear it continually, at every time and in all places. The habit of doing ſo will become natural to him, and he will feel no material annoyance from it. For there is no certainty, that a protruſion of the viſcera would not occur, when the patient is lying in an horizontal poſition, particularly from a fit of coughing, or ſome other occaſional cauſe.

Every patient ſhould be provided with at leaſt two truſſes, which he ought to change every morning in bed, before he gets up. The perſpiration penetrates the leather, rots it, and makes it wet. The patient's ſkin becomes reddened and affected with veſicles and excoriations, which compel him to leave off the apparatus for a time. Or elſe, the ſpring itſelf ruſts, and is rendered unſerviceable. To prevent theſe unpleaſant occurrences, Richter recommends putting a ſmall linen compreſs under the pad, and changing it every morning, ſo as to preſerve cleanlineſs. The back part of the truſs ſometimes produces pain about the ſpine, eſpecially in lean perſons. To obviate this, a compreſs may alſo be placed under the back end of the truſs, or elſe a leather little cuſhion may be faſtened under this part of the apparatus.

Before applying a truſs, great care muſt always be taken that every part of the hernia is really reduced. Should the truſs be put on while any portion of the hernial contents is down, the patient is expoſed to three kinds of danger. Either the preſſure of the truſs upon the protruded part makes the hernia ſtrangulated; or elſe it produces adheſions; or, laſtly, if a piece of inteſtine is prolapſed, it may be rendered

rendered impervious. Alſo, when the truſs is either not well made, or not well put on, the viſcera may ſlip under the inſtrument, in conſequence of various circumſtances, ſuch as falls, leaping, any great exertion, a ſlipping of the truſs, &c. Hence it behoves all patients, even thoſe who are provided with truſſes of the beſt conſtruction, to be circumſpect, and immediately they perceive that ſomething has deſcended into the hernial ſac, they ſhould lie down upon the back, take off the truſs, and reduce whatever has fallen down. A truſs which may at firſt ſit exceedingly well, and keep up the hernia effectually, cannot be at all depended upon, when the patient changes from a fat to an emaciated condition, or from a thin to a corpulent ſtate. It is in particular neceſſary to watch the effect of a truſs for ſome time after the patient has begun to wear it. During the firſt few days, there will almoſt always be found ſomething to improve and rectify, until the patient becomes habituated to the truſs, and the truſs, as it were, to him. When the patient is fat, the truſs makes a depreſſion in the ſkin after a few days, and then no longer ſits with the requiſite cloſeneſs, or ſecurity. The wool alſo, with which the covering is ſtuffed, becomes preſſed more cloſely together, and therefore care ſhould be taken to put on a truſs at firſt with particular tightneſs.

A truſs muſt not make uneaſy preſſure upon the buttocks. When the thigh-ſtrap which goes over the buttock is narrow, the truſs is apt to be dragged downward by the weight of this part of the body. The thigh-ſtrap ſhould therefore be broad, and the patient ought to wear braces. Let a truſs fit ever ſo well and ſecurely, the patient ought to ſhun all violent motion, concuſſions, and exertions of the body. When theſe dangerous circumſtances cannot be avoided, as in coughing, or working for a livelihood, the patient ſhould watch that the truſs fits properly, and that nothing has ſlipped down under it. He ſhould alſo make it a rule to preſs rather ſtrongly upon the pad of the truſs with his hand, upon making any effort or performing any violent motion.

There are two deſcriptions of caſes where a truſs cannot be worn. The firſt is, when the hernia cannot be completely, or at all reduced. The ſecond is when the teſticle, or ſpermatic cord, is ſo diſeaſed as to be incapable of allowing the preſſure of a truſs.

The firſt example is a caſe which will be conſidered in the enſuing ſection of this article. In the ſecond, the firſt indication is to cure, if poſſible, the affection of the teſticle or ſpermatic cord. Perhaps, however, a truſs having a pad with ſuitable excavation, might ſtill be worn,

We have a favourable opinion of Mr. Salmon's truſs, a repreſentation of which will be given in the ſurgical plates. It is there exhibited with the additional ſprings, the force of all the three together being equal to nine pounds' weight. A, a ſpring made ſo as to exert a poſitive force on the cuſhions at each end. At the front and back ends are different holes, to which the plates and cuſhions may be inſtantly ſhifted by the wearer, ſo as readily to admit of adjuſtment in length to ſuit the body. Theſe ſprings are made of ſteel, of equal ſubſtance in all its parts, their edges lying parallel in one plane, and bent to the ſhape without the twiſt, which many common truſſes have. Thus they will indifferently apply either to the right or left ſide of the body; and where one ſide only is diſeaſed, they may be made to go round either that, or the oppoſite ſide, and will, in either caſe, effectually apply and perform their operation without other aid.

B, C, the additional ſprings detached, either or both of which may be added, ſo as to increaſe the power of the truſs when required. Theſe ſprings are ſimply introduced into a looſe leather, or other caſe; and the taking them out; or replacing them, can be inſtantly performed. By this mode of caſing, ſays Mr. Salmon, the wearer may have clean caſes as often as he chooſes, and the ſprings may be exchanged without the mountings at no loſs. The having of different ſprings will be advantageous, in affording the wearer an opportunity of gradually reducing the force of the inſtrument. Alſo, if the ſprings ſhould loſe ſome of their power by ruſting, or otherwiſe, the force may be augmented by the additional ſprings.

D, the front plate with its cuſhion. This plate will apply to either of the holes in the ſpring, and is forced upon the mouth of the rupture by the pin on which it turns in all directions; ſo that whatever be the ſhape or inclination of the body, it adjuſts itſelf to ſuch inclination, not being confined in its direction by any power of the ſpring. The cuſhions are ſimple caſes, ſtuffed with the ſofteſt materials, which may be taken out and replaced at pleaſure.

The force of the ſpring is greateſt on the lower edge, and, conſequently, is transferred to the lower edge of the cuſhion, where the complaint moſtly requires it. When any exertion diſtends the lower part of the belly, inſtead of throwing the cuſhion off altogether, it only turns out the upper edge while the lower one is more forcibly directed againſt the hernial opening. This will particularly happen when a perſon ſits down, and inclines very forward. The belly then projects and thruſts out the upper part of the cuſhion, but the force on the lower part is not thereby decreaſed, but may be proved to be abſolutely increaſed, inaſmuch as leſſening the ſurface of any bodies in forcible contact with others increaſes the violence of the contact.

E, the back plate, with a ſoft cuſhion in front, and having the quality of turning freely in any direction. On both the front and back plates the ſpring reſts ſo free, that the wearer may turn about the plates and cuſhions in any direction, without taking off the ſpring, and the ſpring may be turned up and down, and be worn either above or below the hip without moving the cuſhion. The covers of both cuſhions may be readily changed, and clean ones had at a trifling expence.

Though Mr. Salmon mentions the poſſibility of placing the ſpring above the hip, we preſume he does not mean to recommend the plan. The proper ſituation for the ſpring is always juſt under the ſpine of the os ilium, where it is leaſt ſubject to diſturbance from the action of the muſcles.

F F, a ſtrap to be uſed, if neceſſary, for preventing a forcible removal of the cuſhions. This ſtrap branches out from the ſpring near the hip, and may be regulated nearer or further from the front end. Mr. Salmon's cuſhions are ſtuffed with ſoft materials, ſo as not to be likely to injure the parts preſſed upon. See A Mechanical Analyſis of the General Conſtruction of Truſſes, &c., by R. Salmon, 1807.

In caſes of inguinal hernia, the preſſure of the pads of truſſes has almoſt always been directed to be made upon the abdominal ring. It is contended, however, by Mr. Aſtley Cooper, that this is preciſely the circumſtance in which truſſes are defective. He obſerves, that the object of applying a truſs is to cloſe the mouth of the hernial ſac, and deſtroy its communication with the abdomen, and that this object can never be perfectly fulfilled by any truſs, which is applied in the uſual manner upon the abdominal ring, and extends from it upon the os pubis. In this caſe the cure muſt be incomplete, becauſe a conſiderable portion of the hernial ſac remains uncompreſſed towards the abdomen, and is ſituated between the abdominal ring and the opening of the ſac into the belly. In Mr. Aſtley Cooper's work are to be ſeen engravings, repreſenting hernial ſacs, which have been cloſed by

by the preſſure of a truſs oppoſite the abdominal ring, but are ſtill open to the abdomen above and outwards. Beſides the imperfect operation of common truſſes, Mr. Aſtley Cooper remarks, that the manner in which they preſs the ſpermatic cord againſt the os pubis, frequently occaſions great pain, to relieve which, the patient is conſtantly ſhifting its ſituations and deſtroying its effect, and that often the teſtes themſelves become waſted by the interruption of the paſſage of the blood through the ſpermatic veſſels.

We ſhall find, from the anatomical account which we ſhall preſently give of the inguinal hernia, that the place where the viſcera firſt quit the abdomen, in moſt caſes, is not directly behind the ring, but about an inch and a half from this opening, in a direction upward and outward. Therefore, according to Mr. Aſtley Cooper, the proper method of completely obliterating the mouth of the hernial ſac is to apply the truſs, not upon the abdominal ring, but upon the part at which the ſpermatic cord, and, with it, the hernia firſt quits the abdomen. When the hernia has been reduced, the ſurgeon ſhould lay his fingers oblique above, and on the outſide of the ring, and direct his patient to cough; the furtheſt part from the ring, towards the ſpine of the ilium, where the hernial ſac is felt to be protruded, is the point, which, in Mr. Aſtley Cooper's opinion, ſhould be noted for the application of the pad of the truſs, and the inſtrument ought to be made accordingly. Meaſurement is taken for making the truſs by laying one end of a piece of ſtring upon this ſpot, and carrying the other round the pelvis, midway between the trochanter major and ſpine of the ilium, till it meets the fixed point at firſt determined, and completes the circle. When the hips make an unuſual projection, a piece of wire muſt be uſed.

In large herniæ, Mr. Aſtley Cooper allows, that the pad of a truſs ought to be placed nearer the abdominal ring than in ſmall ruptures. He obſerves, that where the protruſion is ſmall, the pad may be fixed midway, between the ſymphyſis pubis and the ſpine of the ilium. But ſince, in proportion as the hernia grows larger, the mouth of the ſac moves gradually nearer to the abdominal ring, the preſſure of the truſs muſt be regulated accordingly. However, this gentleman ſays, it ſhould never be directed on the os pubis, as preſſure upon the upper and outer part of the ring will ſtill ſerve to retain the viſcera within the abdomen.

In order to enable patients to bathe with a truſs on them, Mr. Aſtley Cooper recommends covering the ſpring with oil-ſkin, which will keep it from becoming ruſty.

When the mouth of a hernial ſac has been obliterated, another ſac has been protruded cloſe by the ſide of the other. A collection of water has alſo been known to occur, in a hernial ſac, after the cloſure of its neck, forming a particular ſort of hydrocele. See Cooper on Inguinal Hernia, chap. v.

Of irreducible Herniæ.—Under this head ſurgical writers comprehend all caſes in which the protruded viſcera cannot be reduced, although they are not ſtrangulated. This incapacity of reduction may be owing to ſeveral circumſtances; but, moſt frequently, ariſes either from the largeneſs of the quantity of the contents, from an alteration made in their form and texture, or from connections and adheſions which they have contracted with each other, or with their containing bag. Sometimes the reduction is prevented by membranous bands, which extend acroſs the ſac and entangle its contents.

The omentum and meſentery are very apt to become enlarged and thickened, in conſequence of long reſidence in a hernial ſac, and ſuch change makes it impoſſible to reduce them through the upper narrow part of the ſac into the belly again. The omentum, from being naturally thin and ſoft, often becomes hard, firm, and compact. When a portion of it has been ſuffered to remain a great length of time in the ſcrotum, without ever having been returned into the belly, it often happens, that although that part of it which is in the lower part of the hernial ſac preſerves its natural, ſoft, expanſile ſtate, yet all that part which paſſes through what is called the neck of the ſac is, by conſtant preſſure, formed into a hard, firm, incompreſſible carnous kind of body, incapable of being expanded, and taking the form of the paſſage in which it is confined, exactly filling that paſſage, and rendering it impoſſible to puſh up the looſe part which fills the ſcrotum. See Pott on Ruptures.

Beſides this ſort of change, we have often ſeen the lower part of the omentum hardened and expanded into a large knob, which enlarged portion was connected with the ſound part within the abdomen by a comparatively ſlender continuation.

In whatever way a hernia is rendered irreducible, the alteration expoſes the patient to ſeveral inconveniences and dangers. There is a continual danger of the protruded parts becoming ſtrangulated, and their ſituation expoſes them to the effects of external violence, by which the bowels have been known to be ruptured, and the patients killed. Another danger is ulceration, which may take place when any pointed body is ſwallowed, and follows the courſe of the food; for when it reaches the hernia, it has been known to make its way outward by ulceration, leaving a paſſage for the feces.

An irreducible hernia, when unſupported, may acquire an enormous ſize, and prove a ſource of other inconveniences. Nearly all the viſcera may deſcend into the ſac, and the ſwelling reach to the knees. Large quantities of fluid may accumulate in the ſac with the viſcera, ſo as to bring on ſerious complaints, and even a burſting of the tumour. The ſwelling may draw over moſt of the ſkin of the penis, and impede copulation. An abſceſs is alſo apt to form in the ſcrotum itſelf, and be kept fiſtulous by the conſtant diſtention of the part. The urine ſometimes trickles over the ſwelling, and excoriates it. See Cooper on Inguinal Hernia, p. 18.

Though ſome perſons with irreducible ruptures have been raſhly adviſed to ſubmit to have the tumour opened, and the parts returned by ſuch operation, yet the attempt has frequently been found to prove fatal. No eminent ſurgeons of the preſent day, therefore, ſanction any proceeding of this kind.

It is remarked by Mr. Pott, that "many, or perhaps moſt of theſe irreducible ruptures, become ſo by mere time and neglect, and might at firſt have been returned; but when they are got into this ſtate, they are capable of no relief from ſurgery, but the application of a ſuſpenſory bag, to take off or leſſen the inconvenience ariſing from the weight of the ſcrotum.

"People in this ſituation ſhould be particularly careful not to make any attempts beyond their ſtrength, nor aim at feats of agility: they ſhould take care to ſuſpend the loaded ſcrotum, and to keep it out of the way of all harm from preſſure, bruiſe, &c. When the tumour is very large, a ſoft quilted bolſter ſhould be worn at the bottom of the ſuſpenſory to prevent excoriation, and the ſcrotum ſhould be frequently waſhed for the ſame reaſon; a loſs of ſkin in this part, and in ſuch circumſtances, being ſometimes of the utmoſt importance. They ought alſo to be particularly attentive to the office of the inteſtinal canal, to ſee that they do not by any irregularity of diet diſorder it, and keep themſelves

ëlves from being coſtive, for reaſons too obvious to need relating. By theſe means, and with theſe cautions, many people have paſſed their lives for many years free from diſeaſe or complaint with very large irreducible ruptures.

"On the other hand, it is fit that mankind ſhould be appriſed, that the quiet inoffenſive ſtate of this kind of hernia is by no means to be depended upon; many things may happen to it by which it may be ſo altered, as to become hazardous, and even fatal; an inflammation of that part of the gut which is down, any obſtruction to the paſſage of the aliment or feces through it, a ſtricture made by the abdominal tendon, either on what has been long down, or on a new portion which may at any time be added to it, are always capable of ſo altering the ſtate of the caſe, as to put the life of the patient into danger.

"Indeed, the hazard ariſing from a ſtricture made on a piece of inteſtine contained in the ſac of an old irreducible hernia, is in one reſpect greater than that attending one that has been found at times reducible; ſince, from the nature of the caſe, it will hardly admit of any attempt toward relief, but the operation, and that in theſe circumſtances muſt neceſſarily be accompanied with additional difficulty.

"Among the ruptures which have been thought not reducible, and treated as ſuch, there have been ſome which, upon more judicious and more patient attempts, have been capable of reduction.

"When this is ſuſpected to be the caſe, the proper method is by abſolute reſt, in a ſupine poſture, for a conſiderable length of time, by great abſtinence, and the uſe of evacuants, ſo to leſſen the ſize of the parts in the hernial ſac, as to render them capable of paſſing back again into the belly." Pott on Ruptures.

Fabricius Hildanus gives an account of a man who was radically cured of a rupture, of twenty years' date, by ſix months' confinement to bed. (Cent. 5. Obſ. 54.)

Le Dran and Arnaud relate inſtances of monſtrous bubonoceles, which diſappeared entirely after the patients had been long confined to bed, and become much emaciated by tedious illneſſes. Some of the moderns have imitated this operation of nature, and by frequent bleedings and repeated purges, have ſometimes ſo far reduced the ſize of the hernia, that it has been returned into the abdomen. Mr. Hey has ſeveral times ſucceeded in this way, (p. 219.) But this practice cannot prove ſucceſsful, when the viſcera adhere to the ſac, or to the peritoneum, juſt within the abdomen. The greateſt objection to this method of cure is the want of an abſolute criterion, by which to diſtinguiſh when the parts do or do not adhere to the hernial ſac, and, in advanced years, though one were ſure that the viſcera were free from the ſac, the poſſibility of hurting the body by the neceſſary evacuations is alſo another objection. Sharp's Critical Enquiry, p. 15.

Were the plan to be thought worthy of trial, keeping up a conſtant preſſure on the tumour by means of a ſuſpenſory bandage, made to lace in front, would be proper for promoting the abſorption of the thickened parts in the hernial ſac. Mr. A. Cooper has reduced ſuch herniæ, after applying ice to them, the good effects of which he imputes to its producing a contraction of the ſcrotum, which performs the office of a ſtrong and permanent compreſſion of the tumour.

Whenever any attempts of this kind ſucceed, "a truſs ſhould be immediately put on, and worn conſtantly without remiſſion; for in theſe people the largeneſs of the abdominal aperture, the thickneſs of the hernial ſac, and the relaxation of the meſentery, make a new deſcent always to be apprehended and guarded againſt." Pott.

There are inſtances, however, on record, in which the capacity of the abdomen had become ſo adapted to the diminiſhed quantity of the viſcera, that when the contents of the hernia were reduced, ſerious complaints aroſe from their introduction into the belly. Schmucker has met with ſeveral ſuch caſes, in which he has been obliged to take off the truſs. Petit has known the reduction of a hernia of this kind prove fatal, the parts not deſcending again when the truſs was removed, the nauſea and vomiting which aroſe continuing, and peritonitis taking place. Chirurgiſche, Wahrnehmungen, vol. ii. p. 243. Traité des Maladies Chirurgicales, tom. ii. p. 392.

Mr. Pott remarks, that "an omental rupture, which has been ſo long in the ſcrotum as to have become irreducible, is very ſeldom attended with any bad ſymptoms conſidered abſtractedly; but it is conſtantly capable of being the occaſion of an inteſtinal hernia, and all its conſequences; neither is that all, for the omentum, either ſo altered in form and texture, or ſo connected as to be incapable of reduction, may by accident inflame, and either become gangrenous or ſuppurate, and the occaſion of a great deal of trouble." In a few inſtances, epiploceles produce very bad ſymptoms indeed, caſes of which are to be found in Garengeot, Dionis, &c.

Sometimes, in old caſes of entero-epiplocele, the inteſtine is reducible, but the omentum is not, in which caſe ſome have adviſed keeping up the piece of bowel with a truſs, the pad of which muſt be ſo contrived as not to preſs on the omentum. Mr. Pott, however, contends that this is not often practicable, and ſhould ſuch a truſs be uſed, he adviſes its being particularly attended to, leſt a ſmall piece of gut ſlip down, and, being preſſed on by the truſs, produce fatal miſchief.

Herniæ are ſometimes, though not very often, rendered irreducible by a contraction of the ſac. Mr. Aſtley Cooper has ſeen ſuch a contraction happen at the middle of the ſac, ſo as to occaſion an hour-glaſs appearance, a piece of omentum lodging both above and below the conſtriction.

The omentum, in old irreducible herniæ, occaſionally becomes affected with ſuch hardneſs as is called ſchirrus, though it does not end in cancer.

Strangulated Hernia.—The ſtrangulated or incarcerated hernia is not only attended with a preſent incapacity of reduction, but the protruded viſcera ſuffer in the paſſage through which they deſcend into the hernial ſac, a degree of preſſure which brings on a train of alarming and too frequently fatal complaints. When inteſtine is lodged in the ſac, a total interruption to the paſſage of the feces is produced. The prolapſed viſcera inflame, and the tumour is rendered exceedingly painful, while an excruciating ſenſation is experienced, ſeeming to proceed from a tight cord round the navel or upper part of the abdomen. Frequent eructations and vomiting ſoon come on. The contents of the ſtomach are firſt diſcharged, and, after an antiperiſtaltic motion has begun in the bowels, bilious matter is thrown up. When the ſtrangulation has been in the colon, Mr. A. Cooper is certain that he has ſeen feculent matter evacuated by vomiting, a circumſtance which he accounts for by the frequently imperfect ſtate of the valve of the cæcum, and by its action being reverſed by the antiperiſtaltic contractions of the inteſtines. An obſtinate conſtipation attends the vomiting, ſo that no ſtools can be obtained, except from the portion of inteſtine below the ſtrangulation by glyſters.

The obſtruction to the paſſage of the inteſtinal contents may not be ſo clearly marked, where a part only of the diameter of the inteſtine is ſtrangulated; but it will often occur to as great a degree in this circumſtance, and will be equally

equally insuperable by purgative medicines, as where the whole width of a bowel is included.

From a note in Mr. Lawrence's excellent treatise on ruptures, it appears that Morgagni mentions a case in which a part only of the diameter was included where the stools were not suppressed; yet it ended fatally. (De Causis et Sed. Morb. ep. 34. art. 15.) Mr. Lawrence refers to many instances in which the constipation was complete, recorded in the Mémoires de l'Acad. de Chirurgie, tom. iii. p. 151. London, Med. Obs. and Enquiries, vol. iv. p. 178 and 355. Philosophical Magazine, vol. xxxi. p. 214 et seq. De Haen, Ratio Medendi, p. 2. c. 4. Morgagni is also stated to have had a patient who died on the sixth day, after constipation continuing the whole time. The entire diameter of the intestine was unobstructed, the protruded part being merely a diverticulum. (Ep. 34. art. 18.) A similar case is said to be related by Benevoli, in Due Relazioni Chir. art. 19. See Lawrence on Ruptures, edit. 2. p. 33.

Besides the vomiting, constipation, &c. the pulse is quick and at first hard. If effectual relief be not obtained, the tumour becomes red and more painful, and when handled, the mark of each finger is left in a white hollow impression, like what occurs on pressing a dropsical limb. The abdomen now becomes slightly tense and sore upon pressure. The vomiting is very frequent, and the whole body covered with sweat. The constipation remains obstinate, and instead of eructation hiccough comes on, whilst the countenance sinks and shews great anxiety, and the pulse grows so small, as to induce the inexperienced to suppose the patient is dying. These symptoms, however, are subject to exacerbations. They are now very violent, but presently the patient feels comparatively easy, and a vain hope of the success of the treatment is raised.

After most severe sufferings during the first stage, the patient suddenly feels better. The tumour, which still continues, all at once assumes a purple or leaden colour, and gives a crackling feel, owing to air being contained in the cellular membrane. The abdomen becomes more tense, the hiccough grows more violent, a cold sweat breaks out over the whole body, and the pulse, though now fuller and softer than before, will, upon careful examination, be found to intermit. Still, however, the patient remains perfectly sensible, full of hopes, and generally continues so till death, which now speedily happens. Mr. A. Cooper states, that this delusive feeling of amendment is so strong, that he has known a patient, at this extremity, insist upon rising, and expire in the very act; and another who sat up in bed, called for something to drink, and died as he was putting it to his lips. We have also known a patient call for some fish and a pint of porter, eat and drink ravenously for a minute or so, and then expire.

It is a very curious fact, that sometimes that remarkable symptom, the constipation, will attend a strangulated hernia, although the omentum is the only part in the sac, and of course the only part which can suffer constriction.

When we examine the hernial tumour after death, a quantity of clear serum is found under the skin, while the sac itself contains a coffee-coloured bloody fluid. The intestine is of a chocolate brown colour, with here and there a black spot, which easily breaks down on being touched with the finger. A coat of coagulable lymph, of the same colour as the intestine, may be peeled from its surface, and adhesions of no great strength exist between the bowel and sac. Where the stricture is, the intestine is either ulcerated through, or may be readily pulled asunder. Air is also found in the cellular membrane, when the inflammation has been very extensive.

Within the abdomen, the peritoneum and bowels are found inflamed. The intestines are streaked with red lines, and glued together. The tension of the belly depends, not upon any general effusion, but upon the quantity of air in the bowels. Cooper on Inguinal Hernia, &c. p. 21.

An omental rupture is not so subject to strangulation as an intestinal one, and, when strangulated, the symptoms which are brought on are less violent than in cases of enterocele, and their progress is not so rapid. The vomiting is not so frequent, the pain in the tumour less, the tension over the abdomen not so great, and the constipation by no means so complete; for stools can in general be procured both by glysters and cathartics, through the whole duration of the disease. The hiccoughs are less violent and constant, and the pulse, though small and frequent, is not so remarkably small and thready, as in the intestinal hernia. The patient lives also longer, sometimes as many as fourteen days. The skin of the tumour occasionally inflames; but it does not do this so frequently as in cases of enterocele; and when an extensive slough is thrown off, it is attended with much less constitutional irritation. The sickness and vomiting, we must suppose, proceed from the connection between the stomach and omentum. This supposition seems to be confirmed by the fact of the symptoms being often influenced by the position of the body, as a mitigation is frequently the consequence of bending the trunk, while an aggravation seems to be the effect of extending it.

When the parts are examined, in cases of death from a strangulated epiplocele, the omentum is found but little changed from its natural colour, being only trivially darker than usual. There is not much fluid in the sac. Though the abdomen is inflamed, and the intestines slightly adherent together, they never appear to have suffered so much as in cases of strangulated enteroceles.

On examining the seat of the strangulation in inguinal herniæ, it will sometimes be found, (says Mr. Astley Cooper,) at the abdominal ring, which, from its unyielding nature, has operated like a tight cord upon the protruded omentum, or intestine. This is the principal point of strangulation in old and large herniæ; but in other cases, it is more commonly situated above the ring, at the place where the spermatic cord first quits the abdomen. The strangulating pressure is here made by the transversalis muscle and its tendon, which pass over the hernial sac in a semi-circular direction, and by the fascia arising from Poupart's ligament, the semi-circular border of which passes under the sac. Hence if a surgeon, in operating for a bubonocele, will pay attention to the precise seat of the strangulation, he will find, that except in large herniæ, cutting through the ring is sufficient to release the protruded parts, and he must proceed with his knife further up towards the spinous process of the ilium, before he can return the swelling.

This fact has led many to suspect the strangulation to be the effect of a thickening of the neck of the sac; but Mr. A. Cooper has learned from dissections, that such a case is unfrequent.

Some affections, which have symptoms somewhat like those of an incarcerated hernia, ought to be carefully discriminated. Mr. Lawrence has judiciously remarked, that "the intestine, included in a large hernia, may be affected with colic, and thus give rise to constipation and vomiting. Thus may be the more easily mistaken for strangulation, if

the parts are adherent, and incapable of reduction. Such an attack may render a reducible hernia incapable of being replaced; particularly if the bowels are much inflated. Clyſters and oily purgatives will produce ſtools under theſe circumſtances, and thereby throw light on the real nature of the caſe.

"The firſt appearance of a rupture may occaſion hiccough, vomiting, and pain; and the ſame ſymptoms may be exhibited in an old caſe, after the patient has taken much exerciſe, or remained long in the erect poſture, in conſequence of irritation, excited by the protruded viſcera in the contents of the abdomen. Here, too, ſtools may be eaſily procured by purgatives.

"The moſt important caſe, however, is where a patient with a rupture has an attack of ileus from ſome other cauſe, in which the original complaint is not at all concerned. The operation, performed on the ſuppoſition that the ſymptoms ariſe from the hernia, would here be not only uſeleſs, but even injurious; and the ſurgeon would neglect thoſe means which the inflammation of the bowels ſo urgently demands.

"Whenever we ſee a patient labouring under the ſymptoms of ileus, we ſhould ſuſpect the exiſtence of a rupture, and make thoſe enquiries and examinations which ſuch a ſuſpicion would naturally ſuggeſt, particularly in females, who are often led to concealment by motives of falſe delicacy. A ſuperficial examination is not ſufficient on theſe occaſions, as a very ſmall portion of inteſtine, not forming any external tumour, may, by its incarceration, cauſe the ſymptoms. If the latter have appeared ſuddenly, and under circumſtances which might cauſe a rupture, if the pain have been firſt felt about the ring, or crural arch, and if preſſure in theſe ſituations increaſe it, and laſtly, if the patient, ſhortly before, had been in perfect health, there is ſtrong reaſon to ſuſpect the exiſtence of a hernia.

"When a perſon, labouring under ileus, has a hernia, which can be reduced eaſily, there is no ground for doubt. If, on the contrary, the parts cannot be replaced, ſtrangulation may be reaſonably ſuſpected, although we cannot immediately conclude, with certainty, that the ſwelling is the cauſe of the inflammation. We ſhould firſt aſcertain whether the parts could be replaced previouſly to the attack; if they could not, and the ſwelling be large and old, they are probably adherent; and the impoſſibility of reduction proves nothing. If they could be returned, and particularly a ſhort time only before the acceſs of the ſymptoms, ſtrangulation may be ſuſpected with juſtice; but it is ſtill not quite certain.

"The following circumſtances will enable the practitioner to decide, in ſimilar caſes, that the ſymptoms are not produced by the hernia; that it is not ſtrangulated; and that the ileus ariſes from an internal cauſe. The pain is felt in the abdomen and not in the ſwelling, which continues ſoft, while the belly is inflated, hard, and tenſe. The attack is ſudden, and not preceded by any of the occaſional cauſes, which could affect the rupture; and the ring is free. The affection extends in the ſequel to the ſwelling, which then becomes painful and tenſe; but it appears later here than in the belly, and does not proceed to ſo great a degree.

"The moſt embarraſſing caſe of all is, where inflammation attacks the protruded parts; but is entirely independent of the rupture. The occurrence is rare, but very poſſible; ſince the inteſtines, included in a hernia, are expoſed to the ſame cauſes of diſeaſe as in their natural ſituation. It may be expected to happen principally in large herniæ. The ſwelling is the ſeat, and not the cauſe, of the diſeaſe. The diſtinction muſt be very difficult. The want of tenſion and of pain at the ring, while the ſwelling itſelf was painful; and the previous attack of feveriſh rigour; might lead us to ſuſpect inflammation of the protruded inteſtine. If the ring afterwards became tenſe, and the included parts conſiderably painful, we ſhould conclude that ſtrangulation had ſupervened, and act accordingly." Lawrence on Ruptures, chap. iv. edit. 2.

Unleſs a ſtrangulated hernia is ſpeedily reduced, it almoſt always proves fatal. However, a few examples do occur in which the ſloughs are thrown off, and the patient ſurvives with a fiſtulous opening in the ſeat of the tumour, through which opening the feces are diſcharged during the remainder of his life.

Prognoſis of Herniæ.—It has been remarked, by that truly eminent ſurgeon, Mr. Pott, that the ſame kind of rupture, in different people, and under different circumſtances, wears a very various face; the age and conſtitution of the ſubject, the date of the diſeaſe, its being free or not free from ſtricture or inflammation, the ſymptoms which attend it, and the probability or improbability of its being returnable, neceſſarily producing much variety. The degree of hazard attending this complaint will be alſo more or leſs as it ſhall happen to be circumſtanced.

"If the ſubject be an infant, the caſe is not often atttended with much difficulty or hazard, the ſoftneſs and ductility of its fibres generally rendering the reduction eaſy as well as the deſcent; and though, from neglect or inattention, it may fall down again, yet it is as eaſily replaced, and ſeldom produces any miſchief. I ſay ſeldom," repeats Mr. Pott, "becauſe I have ſeen an infant, one year old, die of a ſtrangulated hernia, which had not been down two days, with all the ſymptoms of mortified inteſtine.

"If the patient be adult and in the vigour of life, the conſequences of neglect or of mal-treatment are more to be feared than at any other time, for reaſons too obvious to need relating. The great and principal miſchief to be apprehended, in an inteſtinal hernia, is an inflammation of the gut, and an obſtruction to the paſſage of the aliment and feces through it, which inflammation and obſtruction are generally produced by a ſtricture made on the inteſtine. In very old people the ſymptoms do not uſually make ſuch rapid progreſs, both on account of the laxity of their frame, and their more languid circulation, and alſo that their ruptures are moſt frequently of ancient date, and the paſſage a good deal dilated; but then, on the other hand, it ſhould alſo be remembered that they are by no means exempt from inflammatory ſymptoms, and that, if ſuch ſhould come on, the infirmity of old age is no favourable circumſtance in the treatment which may become neceſſary.

"If the diſeaſe be recent, and the patient young, immediate reduction, and conſtant care to prevent its puſhing out again, are the only means whereby it is poſſible to obtain a perfect cure.

"If the diſeaſe be of long ſtanding, has been neglected, or ſuffered to be frequently down, and has given little or no trouble, the aperture in the abdominal muſcle, and the neck of the hernial ſac, may both be preſumed to be large; which circumſtances in general render immediate reduction leſs neceſſary and leſs difficult, and alſo fruſtrate all rational expectation of a perfect cure. On the contrary, if the rupture be recent, or, though old, has generally been kept up, its immediate reduction is more abſolutely neceſſary, as the riſk of ſtricture is greater from the ſuppoſed ſmallneſs

ſmallneſs of the aperture, and narrowneſs of the neck of the ſac. If the rupture be very large and ancient, the patient far advanced in life, the inteſtine not bound by any degree of ſtricture, but does its office in the ſcrotum regularly, and no other inconvenience be found to attend it but what proceeds from its weight, it will in general be better not to attempt reduction, as it will, in theſe circumſtances, moſt probably prove fruitleſs, and the handling the parts in the attempt may ſo bruiſe and injure them as to do miſchief; but this muſt be underſtood to be ſpoken of thoſe only in which there is not the ſmalleſt degree of ſtricture, nor any ſymptom of obſtruction in the inteſtine, ſuch circumſtances making reduction neceſſary at all times, and in every caſe.

"With regard to the contents of a hernia, if it be a portion of omentum only, and has been gradually formed, it ſeldom occaſions any bad ſymptoms, though its weight will ſometimes render it very troubleſome. But if it be produced ſuddenly by effort or violence, that is, if a conſiderable piece of the caul, by accident, ſlip down at once, it will ſometimes prove painful, and cauſe very diſagreeable complaints; the connection between the omentum, ſtomach, duodenum, &c. being ſuch as to render the ſudden deſcent of a large piece of the firſt ſometimes productive of nauſea, vomiting, colic, and all the diſagreeable ſymptoms ariſing from the derangement of theſe viſcera. When the piece of caul is engaged in ſuch a degree of ſtricture as to prevent the circulation of blood through it, it will ſometimes, by becoming gangrenous, be the occaſion of very bad ſymptoms, and even of death, as I have more than once ſeen; and thus, as a mere omental hernia, it may ſometimes be ſubject to great hazard. But even though it ſhould never be liable to the juſt mentioned evil, that is, though the portion of the caul ſhould remain uninjured in the ſcrotum, yet it renders the patient conſtantly liable to hazard from another quarter; it makes it every moment poſſible for a piece of inteſtine to ſlip into the ſame ſac, and thereby add to the caſe all the trouble and all the danger ariſing from an inteſtinal rupture. It is by no means an uncommon thing for a piece of gut to be added to a rupture, which had for many years been merely omental, and for that piece to be ſtrangulated, and require immediate help.

"An old omental hernia is often rendered not reducible, more by an alteration made in the ſtate of the prolapſed piece of caul than by its quantity. It is very common for that part of the omentum, which paſſes through the neck of the ſac, to be compreſſed into a hard, ſmooth body, and loſe all appearance of caul, while what is below in the ſcrotum is looſe and expanded, and enjoys its natural texture. In this caſe reduction is often impoſſible, from the mere figure of the part; and I have ſo often ſeen this, both in the living and the dead, that I am ſatisfied, that for one omental rupture, rendered irreducible by adheſions, many more become ſo from the cauſe above-mentioned.

"In the ſac of old omental ruptures that have been long down, and only ſuſpended by a bag truſs, it is no very uncommon thing to have a pretty conſiderable quantity of fluid collected. This, in different ſtates and circumſtances of the diſeaſe, is of different colour and conſiſtence, and ſeldom ſo much in quantity as to occaſion any particular attention to it; but, on the other hand, it ſometimes is ſo much in quantity as to become an additional diſeaſe to the original one. I have more than once been obliged to let it out, in order to remove the inconvenience ariſing from its weight and the diſtention of the ſcrotum, which I have alſo ſeen become gangrenous by the neglect of this operation.

"If the hernia be of the inteſtinal kind, merely, and the portion of gut be ſmall, the riſk is greater, ſtrangulation being more likely to happen in this caſe, and more productive of miſchief when it has happened; for the ſmaller the portion of gut is, which is engaged, the tighter the tendon binds, and the more hazardous is the conſequence. I have ſeen a fatal gangrene in a bubonocele which had not been formed forty-eight hours, and in which the piece of inteſtine was little more than half an inch. There are few practitioners, who have ſeen buſineſs, but know the truth of this; but perhaps the reaſon of it is not ſufficiently explained to the unknowing. It is this. When a conſiderable portion of inteſtine paſſes out from the belly into a hernial ſac, it neceſſarily and unavoidably carries with it a proportional quantity of the meſentery, which every body knows is a ſtrong double membrane. When the prolapſed part is at all conſiderable this double membrane is again, in ſome meaſure, folded on itſelf, and takes off a good deal of the effect of the ſtricture on the inteſtine. Now, although this circumſtance will not prevent the effect if the means of relief be totally neglected, yet it will moſt certainly retard the evil, and give more time for aſſiſtance; whereas, when there is little or none of the meſentery got through the tendon, and the thin tender inteſtine bears all the force of the ſtricture, it is immediately brought into hazard."

The practical inference to be drawn from hence is too obvious to need mentioning.

"In the inteſtinal, as in the omental hernia, they which have been often or long down, are in general more eaſily returned, and do not require ſuch immediate aſſiſtance as they which have ſeldom been down, or have recently deſcended; and, in the one kind of hernia as well as in the other, the ſtate of the hernial ſac, with regard to ſize, thickneſs, &c. depends very much on the date of the diſeaſe, and the regard that has been paid to it.

"If the hernia be cauſed by a portion of the inteſtine ilium only, it is in general more eaſily reducible than if a part of the colon has deſcended with it, which will alſo require more addreſs and more patience in the attempt. The reduction of a mere inteſtinal hernia too, *cæteris paribus*, will always remain more practicable than that of a mere omental one after it has attained to a certain ſize and ſtate, as the part contained within the former is liable to leſs alteration of form than that within the latter, which alteration, &c. is no infrequent hindrance of the return of an old caul-rupture.

"Not that the parts, within a mere inteſtinal hernia, are abſolutely exempt from ſuch an alteration, as may render their return into the belly impracticable, even where there is no ſtricture; for I have ſeen that part of the meſentery, which has lain long in the neck of the ſac of an old rupture, ſo conſiderably hardened and thickened as to prove an inſuperable obſtacle to its reduction.

"Upon the whole, every thing conſidered, I think it may be ſaid that an inteſtinal rupture is ſubject to worſe ſymptoms and a greater degree of hazard than an omental one, though the latter is by no means ſo void of either as it is commonly ſuppoſed to be; that bad ſymptoms are more likely to attend a recent rupture than one of ancient date; that the deſcent of a very ſmall piece of inteſtine is more hazardous than that of a larger; that the hernia which conſiſts of gut only, is in general attended with worſe circumſtances than that which is made up both of gut and caul; and that no true judgment can be formed of any rupture at all unleſs every circumſtance relating to it be taken into conſideration." Pott on Ruptures.

Treatment of Hernia, particularly the Strangulated Hernia.—Every hernia ought, if poſſible, to be reduced, and be kept from deſcending again by means of a truſs.

When the protruded parts are free from ſtrangulation, but yet are rendered irreducible by any of the cauſes which we have noticed above, all that can be prudently done is to wear a ſuſpenſory bandage, to check the increaſe of the ſwelling. As we have already related the kind of danger in which patients with irreducible herniæ continually live, and as we have alſo inſerted the ſentiments of ſome of the beſt ſurgical writers on the prudence of ſuch patients avoiding coſtiveneſs, exceſſes in eating or drinking, and all violent exerciſes and exertions, we ſhall not expatiate upon theſe topics again.

A ſtrangulated hernia is one of the moſt urgent caſes in ſurgery; if not ſoon relieved it is almoſt always fatal. What is highly worthy of attention is, than no relief can be derived from any plan whatſoever, unleſs it avails in procuring the return of the parts into the cavity of the abdomen, and obviates the conſtriction which the protruded viſcera ſuffer. When theſe objects are not accompliſhed, and this within a very ſhort period of time, gangrenous miſchief takes place in the hernial tumour, and the patient dies of ſuch ſymptoms as have been already deſcribed.

The caſe of a ſtrangulated hernia, therefore, demands a conſiderable ſhare of deciſion and profeſſional judgment on the part of the ſurgeon. He ſhould be familiarly acquainted with all the beſt methods to be tried before the operation, have a determination to put them in practice without the leaſt unneceſſary loſs of time, and be prepared to operate the moment they have manifeſtly failed. Very bad conſequences are often occaſioned by loſing time in the trial of remedies, which promiſe little or no chance of doing good. The plans which a prudent ſurgeon will try are only thoſe which are ſtrongly recommended by real and frequent ſucceſs. Upon all others he will waſte no time, nor will he let even ſuch as have been often effectual induce him to defer the operation to too late a period. Mr. Hey has performed the operation 40 times, and ſtates, that he has often had occaſion to lament that he had performed it too late, but never that he had done it too ſoon. There are ſome caſes ſo urgent that it is not adviſable to loſe any time in the trial of means to produce a reduction. The delay of a few hours may cut off all hope of ſucceſs, when a ſpeedy operation would ſave the life of the patient. Hey's Practical Obſervations in Surgery, p. 130, edit. 2.

Taxis.—When a ſurgeon is called to a ſtrangulated hernia, his firſt duty is to endeavour to reduce the protruded parts with his hands. This is technically called the operation of the taxis, and is performed by making preſſure upon the tumour with the hands, and, at the ſame time, placing the patient in that poſture which gives as much room as poſſible in the abdomen, and relaxes its muſcles and apertures. According to Mr. Aſtley Cooper, the beſt poſition for this purpoſe is ſupine, with the body moderately incurvated. This is effected by laying the patient upon his back, and putting one pillow under the pelvis, and another under the ſhoulders. Both the thighs ſhould alſo be elevated to a right angle with the patient's body, and the knees ſhould be brought ſo cloſe together as only to admit the ſurgeon's arm between them. Mr. A. Cooper repreſents this laſt as a moſt eſſential point, ſince it relaxes the faſcia of the thigh, and conſequently the aperture through which the hernia firſt quits the abdomen, and which is ultimately connected with this faſcia. The patient ought alſo to be deſired to void his urine. The ſurgeon then places himſelf by the patient's right ſide, and, embracing the tumour with his right hand, he preſſes it towards the abdominal ring, ſo as to keep it from receding. Then, applying the finger and thumb of his left hand upon the neck of the tumour, at the part where it enters the abdomen, he gently preſſes it from ſide to ſide, thus endeavouring to get a ſmall portion of it within the abdomen. If any part can be forced up, the reſt generally follows without difficulty. Mr. A. Cooper recommends the preſſure to be maintained from a quarter to half an hour. He adviſes the degree of force to be moderate, as the chief dependance ſhould be placed on continuance rather than violence of preſſure, the latter having been ſometimes known to produce a laceration of the protruded parts. He obſerves, that the longer the hernial tumour has been ſtrangulated, the more dangerous is it to uſe any conſiderable preſſure for its reduction, as the parts then have much leſs power of a reſiſtance than in their natural ſtate. The force of the preſſure ſhould always be directed towards the anterior ſuperior ſpinous proceſs of the ilium, in the courſe which the tumour takes obliquely upwards, and not towards the abdomen immediately behind the abdominal ring. Cooper on Inguinal Hernia, &c. p. 23.

During the taxis the patient is carefully to abſtain from coughing, or making any effort.

The prudence of employing gentle preſſure cannot be too deeply impreſſed upon a ſurgeon's mind. Violence, as Mr. Lawrence remarks, cannot be beneficial, as it is more likely to preſs the parts in a maſs againſt the ring, and thereby bruiſe and injure them, than urge them through the opening. The ſame intereſting writer adverts to ſeveral caſes recorded by Mr. A. Cooper, Mr. Charles Bell, Petit, Morand, and Arnaud, where unſcientific roughneſs produced either ſuppuration of the omentum, or a gangrene or rupture of the inteſtine. Every impartial man muſt agree with Mr. Lawrence, that the danger of the ſubſequent operation will be greatly increaſed by all rough manual attempts, ſuppoſing that they prove ineffectual in accompliſhing the reduction. Petit had much confidence in the plan of making a general preſſure upon the whole ſurface of the ſwelling with both hands.

Mr. Lawrence informs us, that in a bubonocele the following method will ſometimes ſucceed, when more ordinary plans fail; eſpecially when the ſtrangulation ſeems to have been cauſed by an accumulation of fecal matter. "Let the ſurgeon embrace the neck of the ſwelling, cloſe to the tendon, with the finger and thumb of one hand, and carry them downwards with a moderate preſſure, ſo as to remove the contents from the portion next the ring: this will reduce the ſize of that part, which he may then attempt to paſs into the ring with the other hand." Treatiſe on Ruptures, edit. ii. p. 115.

When the common mode of reducing a hernia with the hands has failed, ſome practitioners have adviſed ſuſpending the patient by his knees over the ſhoulders of a ſtrong aſſiſtant, and, in this poſture, endeavouring to return the parts. No eminent modern ſurgeons, however, ſeem to put any confidence in this method. The poſition does not relax the abdominal muſcles; and it is painful to the patient, and awkward to the ſurgeon. Mr. Hey ſays, that he has often tried the plan; but having found it inefficacious, he has, for many years paſt, laid it aſide. Mr. Aſtley Cooper affirms alſo, that he has never found it anſwer when the common method has failed, after being fairly and fully performed.

In attempting the taxis, in caſes of femoral hernia, the direction in which the parts deſcend ſhould be well remembered. They paſs firſt downwards, and then forwards, and of courſe the preſſure ſhould be directed firſt backwards, and then upwards.

Generally ſpeaking, a piece of inteſtine may be more eaſily reduced than a portion of omentum. The former goes up ſuddenly; the latter returns ſlowly, excepting the very laſt bit, which does indeed ſlip up rapidly, but without any noiſe. When the inelaſticity of the ſwelling clearly indicates that the

the contents are entirely omentum, the ſurgeon may venture to uſe more force in his attempts at reduction than could be prudently exerted, were the caſe an enterocele. See Cooper on Inguinal Hernia, &c. p. 24.

It is difficult to lay down any fixed rule reſpecting the time which ſhould be allotted for the trial of the taxis. We have ſtated Mr. A. Cooper's opinion, that the manual attempts ſhould be continued for a quarter, or half an hour. Several celebrated writers on the preſent ſubject, as, for inſtance, Richter, Hey, Deſault, and Lawrence, are ſtrongly adverſe to continuing the manual attempts at reduction, after the tumour has fallen into a painful, inflamed ſtate. Mr. Hey ſays, he is perſuaded that much harm has been done by long continued efforts to replace the ſtrangulated inteſtine, eſpecially when it is in a painful ſtate. The patient, who has been accuſtomed to reduce his own hernia, will perform the operation of the taxis with the greateſt ſafety. If he fails, the ſurgeon ſhould be cautious of doing much. (Pract. Obſ. edit. ii. p. 131.) Mr. Lawrence thinks, that "when the rupture becomes painful, we are no longer juſtified in perſevering in attempts at reduction by the hand. A ſufficient preſſure cannot now be endured; and the force which is employed only tends to increaſe the inflammation and accelerate the approach of gangrene. At this period the operation is required, and ſhould be performed without delay." P. 117.

Experience taught Deſault, that herniæ, attended with highly inflammatory ſymptoms, and ſeldom reducible by the taxis, and that the long continued and violent attempts at reduction, before the operation, have a very unfavourable influence on the event of the caſe. Deſault, therefore, forbade the taxis in ſtrangulated herniæ, accompanied with much inflammation and pain, until the previous uſe of other means had effected a change in the ſtate of the ſwelling. Œuvres Chirurgicales de Deſault par Bichat, tom ii. p. 332, &c.

We conſider the following obſervation exceedingly judicious; it is from the pen of Mr. Lawrence. After ſtating, that he does not mean ſome previous remarks to convey a general diſapprobation of the taxis, he adds, "they are applied to thoſe caſes only in which the exiſtence of conſiderable pain in the ſwelling and abdomen, together with other circumſtances, denotes that the incarceration is of the inflammatory kind. Where the rupture is tolerably free from pain and tenſion, and the general character of the caſe is ſlow and languid, a judicious uſe of the taxis can never be injurious. And although it is undoubtedly true, that the firſt attempt is the moſt likely to be ſucceſsful, and that the hope of reduction diminiſhes as the ſtrangulation continues, it does not follow that other trials ſhould be proſcribed. They may be renewed when the means employed to promote the return appear to have made any formidable change in the tumour, or in the general condition of the patient." P. 120.

When the taxis fails at firſt, it will frequently ſucceed after the patient has been bled, or put in a warm bath. It frequently ſucceeds alſo when aided by ſome other means, which we ſhall preſently conſider.

Bleeding.—When the firſt attempts to reduce the hernia prove ineffectual, many ſurgeons are advocates for immediately bleeding the patient, and then trying the taxis again. Mr. Pott was ſtrenuouſly in favour of veneſection in theſe caſes. "Perhaps," ſays he, "there is no diſeaſe affecting the human body in which bleeding is found more immediately and eminently ſerviceable than in this; and which, therefore, if there are no particular circumſtances in the conſtitution prohibiting it, ought never to be omitted; but, on the contrary, ſhould be freely and largely repeated, if it appears at all neceſſary." (Pott's Chirurgical Works, vol. ii. P. 79.) Benjamin Bell, Calliſen, Richter, Mr. Samuel Sharp, and ſeveral other noted ſurgical authors, are equally favourable to the practice.

A general aſſent, however, has not been given to the plan, ſupported, as it is, upon very high authority. Mr. Wilmer, of Coventry, thinks, that "in theſe caſes, the death of the patient can only be explained by the inverted periſtaltic motion immediately leſſening the powers of life,"—and that "large and repeated bleedings muſt increaſe the debility, and do much miſchief." (Obſ. on Hernia, p. 39.) He alſo entertains an opinion, that bleeding "is extremely unfavourable to the patient's recovery," when the operation cannot be avoided.

Mr. Wilmer has been ſeconded by Mr. Alanſon, on the inutility of bleeding in caſes of ſtrangulated hernia. The latter informs us, that bleeding ad deliquium had been the conſtant practice at Liverpool, and that, "as ſoon as the deliquium happened, the taxis was tried during that ſtage; but I never ſaw this method ſucceſsful, nor do I think bleeding ever of the ſmalleſt ſervice in forwarding reduction." P. 44.

Mr. Aſtley Cooper confeſſes, that though bleeding and the warm bath appear likely to produce a ſtate of body highly favourable for reduction, he has ſeldom been gratified by ſeeing a hernia reduced by them, though they were moſt fairly tried.

The principle upon which bleeding has been ſuppoſed to be uſeful in the caſe of a ſtrangulated hernia, is by occaſioning a general languor, and a conſequent relaxation of the ſtricture, and by checking the inflammation, not only of the protruded parts, but of thoſe which lie within the abdomen. As a ſwoon has been conſidered a very auſpicious moment for reducing the hernia, it has been uſual to endeavour to make the patient faint by bleeding him as he ſtands up, and making a large opening in the vein, in order that the evacuation may be very ſudden.

There can be little doubt that the repreſentations of this ſubject, given by Mr. Wilmer and Mr. Alanſon, have ariſen from the blindeſt prejudices. The good effects of bleeding may have been exaggerated; but have not the ills reſulting from it been magniſied beyond all moderation? That a ſtrangulated hernia is a caſe attended with much inflammation is completely viſible. That patients who die after the operation have the contents of their abdomen highly inflamed, may be aſcertained by ocular inſpection of the appearances which preſent themſelves in the dead ſubject. The aſſertion about the patient's death happening from the inverted periſtaltic action of the bowels *depreſſing the powers of life*, may be ſaid to be nothing but an aſſertion, quite unproved and deſtitute of all probability. Nor is the allegation, that bleeding increaſes the danger of the operation, at all more worthy of a ſerious refutation, when we ſee a ſubject opened who has died after the operation, and caſt our eyes on the reddened and thickened ſtate of the inteſtines, the coagulable lymph effuſed on their ſurfaces, the agglutination of their convolutions together, and, ſometimes, the gangrenous miſchief preſent, we conclude, that the inflammation within the abdomen has had a conſiderable ſhare in bringing on the patient's diſeaſe. Were Mr. Wilmer's idea of the harm which bleeding has done to come into our head juſt at this moment, we ſhould ſcarcely be able to look upon it as much better than nonſenſe.

We entirely agree with Mr. Lawrence, that the advocates and opponents of blood-letting have ſtated their opinions too ſtrongly on the oppoſite ſides of the queſtion, and that a prudent practitioner will take a middle courſe between the two extremes. He will not with Pott uſe veneſection in all inſtances; neither will he follow Mr. Wilmer in diſcarding it entirely

entirely from the treatment of hernia; but will reſtrict its employment to a certain claſs of caſes. He will have recourſe to it when the ſtrangulation is of the inflammatory kind; when the hernia is ſmall and recent; the abdomen tenſe and painful; and the patient young, ſtrong and plethoric. Treatiſe on Ruptures, edit. 2. p. 129.

The inexperienced may ſometimes be deterred from employing the lancet by the weakneſs and ſmallneſs of the pulſe, coldneſs of the extremities, and other marks of debility; ſuch ſymptoms, however, always accompany inflammation of the bowels, and are therefore rather to be regarded as reaſons for bleeding than againſt it, eſpecially when pain and tenſion evidently prevail. The apparent proſtration of the ſtrength is found to be diminiſhed by the evacuation; the pulſe riſes; and warmth is diffuſed over the limbs.

Warm Bath.—When the firſt trial of the taxis has failed, veneſection is to be immediately performed, if the nature of the caſe requires this kind of evacuation. Sometimes, a ſpontaneous aſcent of the hernia follows the loſs of blood. In other inſtances, the reduction is now eaſily effected by the taxis. Frequently all manual endeavours ſtill prove unſucceſsful. When this happens, it is common to direct the patient to be put into a warm bath. Mr. Aſtley Cooper acquaints us, that he generally orders the warm bath immediately after veneſection, before making the ſecond attempt at reduction by the taxis.

The principle on which the warm bath becomes uſeful is ſimilar to that of bleeding. A general relaxation and faintneſs of the body are brought on, which are deemed highly favourable to the reduction of the hernia.

The temperature of the water ſhould be at firſt about one hundred degrees, and it ought to be gradually raiſed, till the patient faints, or feels likely to do ſo. This will commonly happen in about fifteen or twenty minutes; when another attempt to reduce the hernia with the hands is to be made.

Mr. Hey notices that many inſtances are upon record of the good effect of warm bathing, in procuring the reduction of a ſtrangulated hernia. He has often ſeen it uſeful; and often ſeen it fail. When it is tried, he recommends placing the patient, if poſſible, in a horizontal poſition. He thinks that gentle efforts with the hand to reduce the prolapſed part are, perhaps, attended with leſs danger, and with greater proſpect of ſucceſs, while the patient lies in the bath, than in any other poſition. The free uſe of opiates, he ſays, coincides with that of warm bathing, and, under ſome circumſtances, theſe means deſerve to be tried in conjunction. Pract. Obſ. edit. 2. p. 118.

The greateſt objection to the uſe of the warm bath is, that a vaſt deal of time is frequently loſt in preparing the water. Now this is a material conſideration in the choice of every plan in caſes of ſtrangulated hernia. A proceeding which conſumes but a little time, like bleeding, is therefore often to be preferred to ſomething elſe, which may be quite as likely to ſucceed, though, on account of the time it takes up, its failure may leave the patient almoſt paſt relief from any other means. Notwithſtanding we entertain a very favourable opinion of the efficacy of the warm bath, ſince its ſucceſs is always uncertain, we ſhould never have recourſe to it, unleſs it could be got ready in a few minutes. Time is of more conſequence in caſes of ſtrangulated hernia, than in any other ſurgical diſeaſe.

Every one muſt concur with Mr. Lawrence, that the warm bath may be uſed in the early ſtages of the complaint, when the ſymptoms are not yet very urgent. But if the ſtrangulation has laſted ſome time, ſo that the circumſtances require diſpatch; if it has reſiſted more powerful means, ſuch as the topical application of cold and the tobacco clyſter, it would be mere waſte of time to employ this remedy. Treatiſe on Ruptures, edit. 2. p. 132.

Purgatives.—Purgative medicines have been preſcribed in caſes of ſtrangulated hernia, for the purpoſe of exciting the periſtaltic action of the bowels, ſo that the portion confined in the ſtricture may have a chance of being drawn out.

Mr. Hey's experience leads him to condemn, almoſt univerſally, the uſe of purgatives, taken by the mouth, while an inteſtine remains firmly ſtrangulated. In this ſtate of the caſe they uſually increaſe the vomiting, and add to the patient's diſtreſs. Mr. Hey is of opinion, that if they are to be tried, the beſt time is when the vomiting has been relieved by means of an opiate. However, he acknowledges, that he has repeatedly given them in vain, during ſuch an interval of relief.

Though cathartics are moſt properly abandoned, in caſes of hernia attended with conſiderable ſtrangulation, there are ſome circumſtances in which their utility is confeſſed by very excellent ſurgeons. Mr. Aſtley Cooper thinks, that when the ſymptoms are only ſlight, aperient medicines may be given, if there is either no vomiting, or only at diſtant intervals. In ſuch caſes, he has known opium, joined with calomel and cathartic extract, produce ſtools, and relieve the patient. On Inguinal Hernia, p. 25.

In the entero-epiplocele, when the inteſtine has retired, and the omentum remains ſtrangulated; or in a ſimple ſtrangulation of the omentum, where the inteſtine has not been prolapſed; purgatives are of great utility. So likewiſe, in very large and old herniæ, where there is reaſon to doubt whether the diſeaſe is not to be conſidered as a morbid affection of the inteſtinal canal, rather than the effect of ſtrangulation, purgatives may be as uſeful as in the ſimple ileus without hernia. (Hey, p. 114. edit. 2.) Alſo, in old large herniæ, where an accumulation of fecal matter, from torpor of the inteſtine, is the cauſe of ſtrangulation, and the ſymptoms are of the chronic kind, purgatives may be employed with ſucceſs. Mild aperients, however, like the Epſom ſalt, exhibited in ſmall repeated doſes, are here better than ſtronger cathartics, and opium may be added to make them agree with the ſtomach. See Lawrence on Ruptures, p. 133. edit. 2.

Purgative Clyſters.—Theſe are not liable to the objection of increaſing the irritation and vomiting, in the manner cathartics taken by the mouth do; but they ſeem to poſſeſs little efficacy. Mr. Hey declares, that he never ſaw an inſtance, in which clyſters, either made with purgative ingredients, or ſimply laxative, as of broth, or water gruel with oil, produced a return of the ſtrangulated hernia. They merely empty the large inteſtines, and do no more. This muſt alſo be in general an uſeleſs ſtep, as it is uſual for a motion ſoon to follow the occurrence of ſtrangulation. However, when purgatives are indicated, their operation may be aſſiſted with clyſters.

Opiates.—Mr. Hey has met with ſeveral examples, in which the free exhibition of opiates, after bleeding, has procured the reduction of a ſtrangulated hernia in athletic ſubjects.

According to the ſame practical writer, opium will often remove, for a time, the pain and vomiting uſually attendant upon a ſtrangulation, even where it proves ultimately inefficacious. This will frequently enable patients to keep upon their ſtomachs ſuch other medicines as may be deemed neceſſary. For the ſame reaſon, opium may be a very valuable medicine, when it is requiſite to move the patient any diſtance to be operated upon. When opium is tried, with a view of relieving the ſtrangulation, the doſes ſhould be

be large; and when the ſymptoms return, after being appeaſed by this medicine, Mr. Hey thinks, that the performance of the operation ought to be no longer deferred. P. 121. edit. 2.

Mr. Aſtley Cooper coincides with Mr. Hey, in regard to the efficacy of opium, in allaying the violence of the vomiting, and in aſſiſting the attempts at reduction after a copious bleeding. On Inguinal Hernia, p. 25.

Tobacco Clyſter.—All modern ſurgeons ſeem univerſally to agree, that, next to the operation, the tobacco clyſter, aſſiſted by cold applications to the tumour, is the moſt effectual means of relief. Mr. Aſtley Cooper confeſſes, that if this method were to fail, he ſhould be little inclined to await the trial of any other remedy. Tobacco has been employed in caſes of ſtrangulated hernia, both in the form of ſmoke, and as a liquid clyſter. To uſe the ſmoke with any effect requires a complicated apparatus. This plan, beſides being the moſt troubleſome, is alſo the leaſt certain in its operation. Hence it is at preſent not much adopted by judicious practitioners. Mr. Hey ſays, that he has frequently injected the fume of tobacco; but is inclined to prefer the decoction, both on account of its more powerful and ſpeedy effect, and as being more conveniently adminiſtered. Pract. Obſ. p. 126. edit. 2.

The moſt advantageous way of making the tobacco clyſter, is to infuſe a dram of tobacco, for ten minutes, in twelve ounces of boiling water, and then ſtrain the fluid for uſe. As dangerous and even fatal effects, however, may ariſe from this powerful plant, the moſt prudent method is to inject only half of the preceding quantity at firſt, and the remainder half an hour afterwards, if the previous portion has not proved ſufficient. The tobacco clyſter appears ſometimes to operate with dangerous violence, which may be owing either to the ſort of tobacco uſed, or to ſome particularity in the patient's conſtitution.

Mr. Aſtley Cooper moſt properly condemns the raſhneſs of injecting all at once a clyſter made with two drams of the plant, as ſome ſurgeons have ventured to do. He obſerves, that he once ſaw a man, with whom the tobacco clyſter had been uſed in this way, without effecting the reduction of the ſwelling, who, about half an hour afterwards, was put upon the table to have the operation performed, when his pulſe was found ſo low, his countenance ſo depreſſed, and his body ſo covered with cold ſweats, that he was ordered back to bed, and, on carrying him thither, he expired. The ſame gentleman tells us of another inſtance, in which a girl died thirty-five minutes after ſuch employment of tobacco, and moſt obviouſly from its effects. On Inguinal Hernia, &c. p. 24.

Cold Applications.—The cold bath, and the throwing of cold water upon the patient, are ſaid to have ſometimes ſucceeded; but they have failed ſo often, that judicious practitioners are little inclined to devote time to a trial of them. Next to the tobacco clyſter, the beſt ſurgeons ſeem now univerſally to agree, that putting cold applications upon the tumour has the moſt effect in promoting the reduction of a ſtrangulated hernia. It is in ſome meaſure fortunate, that ſuch applications, and the tobacco injection, admit of being put into practice together, ſo as to give the patient the chance of benefit ariſing from their combined effect. Vinegar and brandy, and vinegar with ſal ammoniac, have been uſed for this purpoſe. The moſt ſimple and efficacious method, however, is to apply ice to the tumour, when it can be procured. Mr. Aſtley Cooper recommends it to be broken in ſmall pieces, and a bladder to be about half filled with it; tied up, wiped dry, and laid upon the hernia, ſo as to cover the inflamed and ſwollen parts. According to this gentleman, the effect of this plan is almoſt immediately to diminiſh pain, to make the ſkin over the tumour contract, and to effect the reduction of the protruded parts by the preſſure thus produced. He ſtates, that one advantage of this remedy is, that it arreſts, for a length of time, the progreſs of the ſymptoms, ſo that it may be continued for ſeveral hours upon the part, without incurring the riſk of loſing too much time. If, after a trial of about four hours, the ſymptoms become mitigated, and the tumour is leſſened, M A. Cooper adviſes a perſeverance in the plan for ſome time longer; but if they continue with unabated violence, and the tumour reſiſts every attempt at reduction, no further trial of the ice ſhould be made. By mixing ſalt with the ice, the degree of cold may be increaſed, even beyond what can ſafely be employed.

Mr. A. Cooper cenſures the cuſtom of applying the ice, wrapped up between folds of cloth, ſince the melted portion keeps the patient's bed wet and uncomfortable, beſides the method being apt to render the parts froſt bitten, and apt to ſlough.

Since ice cannot always be procured, it is ſometimes neceſſary to apply a ſubſtitute. The moſt convenient is a mixture of ſal ammoniac and nitre, finely powdered, and blended together in equal proportions. Ten ounces of the mixed ſalt is to be put into a bladder, into which has been previouſly put ſixteen ounces of water. The bladder is then to be tied up, and laid upon the tumour. The degree of cold, produced by this mixture, is lower, in the hotteſt weather, than the freezing point of water, and if the water be previouſly cooled, the cold will be greater.

Nitrated ammonia and water, in equal parts, produce a ſtill greater intenſity of cold; but this ſalt cannot commonly be had. The cold produced by vinegar and ſal ammoniac, and by vinegar and ſpirits of wine, is too ſlight to be depended upon. Cooper on Inguinal Hernia, p. 25.

Fomentations and Poultices.—Of all the means of promoting the reduction of a ſtrangulated hernia, theſe are certainly the moſt inſignificant. Were they uſed in any other leſs urgent diſeaſe, the thing would not be of ſo much conſequence. But, in the preſent inſtance, the loſs of a very little time often makes a fatal difference in the fate of the patient. For this reaſon, though poultices and fomentations do no harm of themſelves, they create a waſte of time, hinder the trial of more effectual meaſures, and become indirectly highly detrimental. We ſhall only add, that their efficacy is almoſt univerſally doubted, if not denied, by ſuch ſurgeons as have had much experience. Thus we ſee, that all the means for removing the viſcera from their ſtrangulated ſtate are, with the exception of the operation, exceedingly uncertain. Hence it ſhould be a principle with the ſurgeon, not to ſpend too much time upon them. The neceſſity of an early recourſe to the operation can ſcarcely be preſſed in too ſtrong terms upon the mind of the practitioner. If Mr. Pott's opinion be true, that the operation, when performed in a proper manner, and in due time, does not prove the cauſe of death oftener, than, perhaps, once in fifty times; it would undoubtedly preſerve the lives of many to perform it almoſt as ſoon as the diſeaſe commenced, without increaſing the danger by ſpending much time in the uſe of means, which cannot be depended upon for a cure. Mr. Hey has twice ſeen this diſeaſe prove fatal in about twenty-four hours. He remarks, that, in ſuch caſes, there is evidently little time for delay. A ſurgeon, who is competent to perform the operation, is not, perhaps, conſulted, till the inteſtine is on the point of being mortified; or is actually in a ſtate of mortification. The dilemma, into which he is then caſt, is painful indeed. But when the fulleſt opportunity

portunity is afforded him of using the beſt mode of treatment, his ſucceſs will be the greateſt when the operation is not long delayed. Mr. Hey declares, that when he firſt entered the profeſſion of ſurgeon, it was cuſtomary to conſider the operation as the laſt reſource, and as improper until the danger appeared imminent. By this dilatory mode of practice, he loſt three patients in five, upon whom the operation was performed. After having more experience, he made it a cuſtom, when called to a patient, who had laboured two or three days under the diſeaſe, to wait only about two hours, in order to try the effect of bleeding, (when this was not forbidden,) and of the tobacco glyſter. By this method he has only loſt about two patients out of nine, after the operation. This compariſon is ſaid to be drawn from caſes nearly ſimilar, inſtances with gangrene being excluded from the computation. See Pract. Obſ. in Surgery, p. 128—130. edit. 2.

Every one muſt coincide with Mr. Aſtley Cooper, that it would be a fortunate thing if ſurgeons were poſſeſſed of any criterion, which, by ſhewing the exact ſtate of the protruded parts, would enable them to judge of the lateſt time, to which the operation could be ſafely delayed. This gentleman remarks, that hiccough has been named as the deciſive ſymptom of mortification; but that this opinion is now known to be inaccurate, ſince the operation has ſeveral times been performed in the hoſpitals of the Borough, after this ſymptom has occurred, when the parts have been found free from mortification, and the patients have recovered. On the other hand, the body of a woman was examined, who had died of a ſtrangulated hernia, in which a portion of the ilium was mortified, though there had not been the ſlighteſt hiccough during the progreſs of the diſeaſe.

Mr. Aſtley Cooper is always anxious to perform the opetion before the abdomen feels ſore upon being preſſed. He obſerves, that ſoon after the ſymptoms of ſtrangulation appear, the abdomen becomes tenſe, owing to the flatulent diſtention of the inteſtines; but ſtill the patient does not immediately complain of ſoreneſs upon preſſure. No ſooner, however, does ſuch tenderneſs ariſe, in conjunction with the tenſion, than it is manifeſt that the inflammation has extended into the cavity of the abdomen. In this ſtate we have peritoneal inflammation to contend with, which, unfortunately, is likely to be increaſed by the operation, the only means of relieving the ſtricture. Hence this gentleman is of opinion, that as ſoon as bleeding, the warm bath, the tobacco glyſter, and topical cold, have been fairly tried, and have proved unſucceſsful, if the abdomen is becoming affected, the operation ſhould be no longer delayed. Indeed, ſays he, if the warm bath cannot be conveniently and quickly procured, it is better to omit it altogether, than endanger the patient's life by the delay.

The ſoreneſs, upon preſſing the abdomen, is repreſented as being a much better criterion than the time which has elapſed ſince the occurrence of the firſt ſymptoms of ſtrangulation; for there is the utmoſt variety in the time which elapſes between theſe ſymptoms and a fatal termination. Mr. Aſtley Cooper further informs us, that in the muſeum of St. Thomas's hoſpital, there is a drawing of a large inteſtinal and omental hernia, which Mr. Elſe uſed to ſtate in his lectures, proved fatal in eight hours from the firſt appearance of ſtrangulation. Mr. Cooper himſelf has, on the other hand, known the operation to be ſucceſsfully performed at the end of eight days, after the acceſſion of the ſymptoms of ſtrangulation, although death generally happens on the ſixth or ſeventh day from the commencement of the ſymptoms.

This eminent ſurgeon thinks, that ſome judgment may be formed from the pulſe, and from the patient's general appearance. If the pulſe be ſo ſmall as to be ſcarcely perceptible, and the countenance anxious and ſunk, no time is to be loſt. He has known the operation ſucceed in theſe circumſtances, though conjoined with hiccough. Indeed, the operation may ſave life, even when the parts are gangrenous, by promoting the ſeparation of the ſloughs. On Inguinal Hernia, &c. chap. 9.

Small herniæ more frequently demand the operation than large ones, and epiploceles, generally ſpeaking, admit of rather more delay than enteroceles.

We ſhall next enter upon an account of particular herniæ, and the mode of operating in different caſes.

Inguinal Hernia, or Bubonocele.—In this caſe, the viſcera are protruded from the abdomen in the courſe of the ſpermatic cord. While the ſwelling reaches no lower than the groin, the name of bubonocele is adopted; when the parts have deſcended lower, the caſe is called an oſcheocele, or ſcrotal hernia. The viſcera firſt eſcape out of the cavity of the abdomen, about an inch and a half on the outer ſide of the abdominal ring, in a line extending from the pubes to the anterior ſuperior ſpinous proceſs of the ilium. If the progreſs of the hernia be unchecked, it proceeds, by degrees, obliquely downwards and inwards, as far as the abdominal ring. While the tumour lies within the ring, the diſeaſe is often unſuſpected by the patient. The tumour then deſcends through the abdominal ring into the ſcrotum, where, being leſs confined, its exiſtence becomes completely manifeſt, and it is apt to increaſe to an enormous ſize, ſo as even to reach down as far as the knees.

Upon diſſecting an inguinal hernia, we find under the ſkin of the ſcrotum a faſcia, which is more or leſs thick in proportion to the duration and ſize of the ſwelling. This faſcia is given off by the tendon of the external oblique muſcle above the abdominal ring.

Beneath ſuch faſcia lies the cremaſter muſcle, which forms another covering of the hernial ſac, and is often found much thickened and expanded.

When the faſcia and cremaſter muſcle are removed, the proper hernial ſac comes into view, being thinner than the two former coverings, but ſomewhat thicker than the peritoneum, from which it is derived.

Behind the hernial ſac the ſpermatic cord is ſituated above, and the teſticle below. The ſac, therefore, lies between the cord and the cremaſter muſcle, anterior to the former, and poſterior to the latter. Above the abdominal ring the direction of the hernia is obliquely upwards and outwards towards the ſpine of the ilium, like that of the ſpermatic cord. Here the hernial ſac is covered in front by the tendon of the external oblique muſcle, the ſpermatic cord being ſtill behind, and yet more backward, the tendons of the internal oblique and tranſverſalis muſcles, and the above faſcia. At the upper aperture in the faſcia, the ſac penetrates the abdomen along with the ſpermatic cord. This part is called the mouth of the ſac, between which and the ſymphyſis pubis paſſes the epigaſtric artery, running in ſome degree under the ſac and along its inner ſide. As Mr. Aſtley Cooper further explains, there is no veſſel of importance above the mouth of the ſac, nor externally between it and the ſpinous proceſs of the ilium.

From the very accurate accounts publiſhed by this gentleman, it appears, that in old and large herniæ the poſitions of the internal and external openings of the ring are changed, in relation to the tumour, by the conſtant preſſure of the protruded parts, the mouth of the ſac coming then almoſt into contact with, and nearly oppoſite to, the abdominal ring.

Mr.

Mr. A. Cooper informs us, however, that ſuch change produces no alteration in the relative poſition of the epigaſtric artery, except in giving it a greater curve.

The hernial ſac is commonly in front of the ſpermatic cord; but occaſional inſtances are met with, in which the ſpermatic cord is ſeparated, and the hernial ſac protruded between its veſſels, the vas deferens being on one ſide, and the blood-veſſels on the other. The ſpermatic vein and artery have been ſeen in front of the ſac, and the vas deferens behind it. The whole of the cord is alleged to have been found in front of the ſac. Hence operators ſhould not make their firſt inciſions without caution and conſideration.

The diſtinguiſhing ſymptoms of an inguinal hernia are, according to Mr. Aſtley Cooper, of the following kind.

When the patient is deſired to cough, the tumour becomes immediately diſtended. When the patient can ſtate, from his remembrance, that on the firſt appearance of the tumour in the groin, it uſed to return into the abdomen, when he was in a horizontal poſture, and to re-appear, when he ſtood up, though circumſtances may long have rendered ſuch aſcent and deſcent impoſſible. When the progreſs of the tumour has been from the groin gradually downwards to the ſcrotum. When the caſe is an enterocele, it has an elaſtic and uniform feel, and goes up with a guggling noiſe. When the caſe is an epiplocele, the tumour is leſs equal upon its ſurface, receives an impreſſion from the fingers, is heavier than the former ſwelling, and does not make a noiſe on aſcending into the abdomen. Laſtly, eructations, ſickneſs, conſtipation, colic pains, and diſtention of the abdomen, are apt to occur; and pain is produced by violent exertions, coughing, ſneezing, &c. Such complaints generally firſt lead the patient to ſuſpect the diſeaſe.

There are ſome diſeaſes which have often been miſtaken for an inguinal hernia.

The hydrocele may be known by the ſwelling beginning at the lower part of the ſcrotum, and afterwards gradually extending upwards towards the ring. The ſpermatic cord and teſticle can only be felt with difficulty, while in hernia they may, in general, be plainly felt behind the tumour. A hydrocele does not become dilated when the patient coughs; it communicates the ſenſation of a fluctuation, when ſtruck with the fingers, and has a tranſparent appearance, when a lighted candle is put behind it.

Cyſts, filled with water, ſometimes form upon the ſpermatic cord. When quite below the ring, they may be readily diſcriminated by their not being connected with the abdomen. When it reaches within the ring, and has no diſtinct tranſparency or fluctuation, it ſhould be opened with great circumſpection. We have known ſuch an hydrocele of the cord accompany the exiſtence of an old hernial ſac, be miſtaken for a protruſion of the viſcera, and on account of complaints induced by a kick in the groin, operated upon, under the idea of the caſe being a ſtrangulated hernia. When the cyſt, the ſuppoſed hernial ſac, was opened, the fluid which it contained was diſcharged, and, on introducing the finger, nothing was found but a circumſcribed cavity. After ſome more inciſions, an opening was made in the real hernial ſac, which was not ſuſpected of being ſo, and had no protruſion of the viſcera within it. Upon paſſing a finger upwards, ſome fluid, which came from the abdomen, eſcaped. All now ſeemed uncertainty reſpecting what the caſe actually was, nor did the doubt ſubſide, till the parts were examined, after death, the following day.

An enlargement of the teſticle may be diſcriminated from a hernia by its ſhape, which is retained even in diſeaſe by its weight, the pain generally attending it, and by the intolerable ſenſation ariſing when this organ is preſſed.

Hæmatocele, or a collection of blood in the tunica vaginalis, is very apt to be confounded with a hernia, in conſequence of its generally proceeding from a blow, and having the ſame ſhape as the laſt diſeaſe. But, ſays Mr. Aſtley Cooper, the firmneſs of hæmatocele, the redneſs of the ſkin accompanying it, its not dilating when the patient coughs, and the ſpermatic cord being free from ſwelling at the ring, will point out the difference of the complaint from a hernia.

Of all diſeaſes the varicocele is moſt liable to be miſtaken for a hernia. When large it dilates upon coughing, but not otherwiſe. It appears in the erect, and retires in the recumbent poſture. It is firſt obſerved near the ring. The only ſure method of diſtinction with which Mr. Aſtley Cooper is acquainted, is to make the patient lie upon his back and then to empty the ſwelling by preſſure upon the ſcrotum. The ſurgeon now putting his fingers firmly upon the upper part of the abdominal ring, the patient is deſired to riſe. If it is a hernia the tumour cannot re-appear, while the preſſure upon the ring is continued. But if it is a varicocele the ſwelling returns with increaſed ſize in conſequence of ſuch preſſure. See Cooper on the Anatomy, &c. of Inguinal Hernia.

Operation for the Strangulated Inguinal Hernia.—When relief cannot be obtained from the plans already detailed in the foregoing columns, the ſurgeon is called upon to perform an operation which conſiſts in dividing the integuments, diſſecting down to the ſac, and opening it; removing the ſtricture, and replacing the protruded viſcera. The external inciſion ſhould begin an inch above the outer angle of the ring, and extend over the middle of the tumour to its lower part. It is judiciouſly remarked by Mr. Lawrence, that by beginning the inciſion above the ring, the operator gains room where it is much needed in a ſubſequent part of the operation, *viz.* the inciſion of the ſtricture, and for the ſame reaſon the cellular and adipous ſubſtance, in this ſituation, ought to be divided, ſo as to bring the aponeuroſis of the external oblique muſcle fairly into view. Either by this firſt inciſion, or in the ſubſequent diſſection down to the ſac, the external pudic branch of the femoral artery may be divided, and ought to be tied when the hemorrhage from it is profuſe. After thus dividing the ſkin, the cellular ſubſtance lying upon the outſide of the hernial ſac is to be raiſed with a pair of diſſecting forceps and cautiouſly cut, layer by layer. In order to leſſen the riſk of cutting ſuddenly through the ſac and wounding the bowels, the ſurgeon ſhould not only elevate the layers of cellular ſubſtance with the forceps, but take care to divide them with the edge of the knife inclined rather horizontally. Many operators diſplay great awkwardneſs and abſurdity in diſſecting a little in one place and then in another, without effecting the object in view at any point till after a conſiderable time. The thing deſired is to make an opening into the ſac in one particular place. This can be accompliſhed with moſt ſecurity at the lower part of the tumour, becauſe fluid is ſometimes contained in the ſac, and, in that caſe, always gravitates to the bottom of the ſwelling. An opening having been made, it is to be enlarged in both directions with the probe-pointed biſtoury, guided by the finger or director until the whole cavity is laid open. The preſence of fluid is not a conſtant circumſtance, and, therefore, cannot be depended upon as a criterion, which will always ſerve for ſhewing when the firſt aperture is made in the hernial ſac. The circular arrangement of the arteries of the inteſtine, and its very ſmooth ſurface, diſtinguiſh it from the hernial ſac, which is rather rough and cellular on its ſurface, and is in general cloſely connected with the ſurrounding parts. Since the ſpermatic veſſels are apt ſometimes to de-

viate from their ordinary ſituation, in reſpect to the hernia, and lie more or leſs in front of the ſac; every operator ought to endeavour to aſcertain ſuch variations, if poſſible, before hand, in order that he may avoid parts which ſhould never be injured. When the hernial ſac has been in this manner opened, and its contents fairly brought into view, the next object is to liberate them from the ſtate of ſtricture in which they are. In a few examples, indeed, the parts may be now reduced with the hand, and without any further employment of the knife. In moſt inſtances, however, it is otherwiſe; the ſtricture muſt be cut, and if this ſtep be neglected, the ſurgeon will either not be able to effect the reduction at all, or will only ſucceed by exerting ſuch force and roughneſs on the protruded viſcera, as muſt inevitably be followed by the moſt pernicious effects. Therefore, whenever the parts cannot be returned with eaſe after opening the ſac, it is the duty of the ſurgeon to refrain from all manual violence, and proceed to dilate the ſtricture. With this view he muſt firſt try to aſcertain its ſituation by gently introducing his finger into the neck of the ſac. The requiſite diviſion ſhould be executed with a curved probe-pointed biſtoury, guided by the finger of the operator, which will protect the protruded parts. Should the tightneſs of the contraction exclude the employment of the finger, a grooved director muſt be made uſe of. "The finger ſhould be carried as far into the neck of the ſac as it can be without violence, and between the protruded parts and the upper margin of the ſtricture. The biſtoury, with its back reſting on the finger, is puſhed forwards towards the abdomen, followed and ſupported by the finger which protects the viſcera. The length of the inciſion ſhould not exceed what is ſufficient to allow the viſcera to be replaced with eaſe." Lawrence, p. 203. edit. 2. The direction in which this cut is made is of conſiderable importance, ſince the proximity of the epigaſtric artery to the mouth of the hernial ſac expoſes ſuch veſſel to injury. Sharp and Pott have adviſed practitioners to make the diviſion of the ſtricture in the direction upwards and outwards, a method which is attended with ſafety in all ordinary caſes, and is only exceptionable when the viſcera are protruded on the inner ſide of the epigaſtric artery. Yet, even in the laſt-mentioned example, the veſſel is ſo diſtant from the external angle of the ring, that in general it cannot be wounded by cutting upwards and outwards, unleſs the inciſion be carried to a far greater extent than is uſually requiſite. On the erroneous ſuppoſition that the artery has the ſame relation to the abdominal ring both in ſound and diſeaſed ſtate; Richter and Bertrandi adviſe ſurgeons to divide the ſtricture upwards and inwards, a plan which is highly improper in common caſes, as the preceding artery would be cut; but the method might be followed in the leſs frequent inſtances, where the hernia makes its protruſion on the inner ſide of that blood-veſſel. Unfortunately the caſes of one deſcription and the other hardly admit of being diſcriminated with ſuch certainty as to afford any guidance to the operator, in regard to the direction in which the ſtricture ought to be cut. Mr. Aſtley Cooper recommends always making the diviſion directly upwards, in a courſe parallel to the linea alba, a mode of proceeding which will be free from danger, whatever may be the ſpecies of inguinal hernia. According to that judicious writer, Mr. Lawrence, the preciſe point at which the inciſion of the tendon ſhould be made, is at the middle of the ſuperior margin of the ring; the artery can never be ſituated at this part, nor expoſed to danger, unleſs the inciſion be extended to a moſt unreaſonable length. In every inſtance in which the ſtrangulation exiſts at the ſuperior opening of the ring, the epigaſtric artery is ſituated at the inner margin of the neck of the hernial ſac. When the ſtricture is of this kind, it may be divided much in the ſame way as the aperture in the tendon of the external oblique muſcle, namely, with a probe-pointed biſtoury, guided by the fore-finger of the left hand. Mr. Aſtley Cooper employs for this purpoſe a very good inſtrument, which is a biſtoury, that has a cutting edge reaching only a little way from the point, and which is introduced with the flat ſide towards the finger, until the probe-point has paſſed under the ſtricture, when its edge may be inclined up ſo as to divide the margin of the tranſverſe muſcle as far as circumſtances require. The external opening of the ring in this caſe ought never to be dilated, unleſs there ſhould not be room enough to get at the ſtricture, an event which can happen only ſeldom. The ſtricture may be ſituated both at the outer and inner opening of the ring, and require to be divided in each place, ere the reduction can be accompliſhed with the due degree of facility.

Mr. Aſtley Cooper has conjectured, that it might be advantageous to leave the neck of the hernial ſac undivided, and in dilating the ſtricture, he has been in the habit, therefore, of introducing the curved biſtoury between the abdominal ring, and the portion of peritoneum, which conſtitutes the upper part of the ſac. He thinks, that as, in this method, the wound is further from the peritoneum, inflammation of that membrane is leſs likely to be induced by the operation; and that in caſe the epigaſtric artery ſhould be wounded, the blood cannot inſinuate itſelf into the abdomen. The propriety of this plan has been ably examined by Mr. Lawrence, in his excellent treatiſe on hernia. The two reaſons, adduced by Mr. Aſtley Cooper in favour of the practice, are certainly not weighty, becauſe the firſt has not yet been proved by comparative trials, and the ſecond muſt appear unimportant, if the operator merely follow this author's own excellent maxims relative to the direction, in which the ſtricture ſhould be cut, by which means all riſk of wounding the epigaſtric artery would be entirely out of the queſtion. Mr. Lawrence urges ſeveral objections againſt the plan, founded on its difficulty, or the danger of injuring the protruded parts when the ſtricture is tight, the danger of leaving an inch of the ſac below the ring undivided, forming a ſort of a bag ready to receive any future protruſion, and diminiſhing the chance of a radical cure.

The laſt thing which the ſurgeon has to atchieve in the operation, is to reduce the viſcera into the cavity of the abdomen, a circumſtance, which may be directly done, when the protruded parts are ſound and free from adheſions. At the moment of attempting to make the reduction, the limb ſhould always be placed in a bent poſition. The records of ſurgery furniſh us with innumerable examples, which prove the propriety of never being deterred from returning the bowel merely becauſe it is of a dark brown colour. In fact, poſitive mortification is the only ſtate which can juſtify the operator in not putting the part back into the abdomen again. When the bowel is of the darkeſt brown, and almoſt black colour, it ſhould always be reduced, unleſs actually mortified. The beſt writers on the ſubject are now univerſally of one ſentiment on this important point, and the caſes ſhewing how frequently the diſeaſed action, indicated by the alteration of colour, ſtops, on the removal of the exciting cauſe, may be peruſed in the works of ſome of the moſt accurate obſervers, as thoſe of Warner, Acrel, Theden, Lawrence, &c.

In many caſes the practitioner may feel uncertain, whether a diſcoloured portion of inteſtine is mortified or not, and conſequently may be embarraſſed as to what line of conduct he ought to purſue. For the purpoſe of aſcertaining whether the

the altered bowel is really mortified or not, we are directed to preſs forward the blood in its veins, and if they become filled again, it is inferred that the part is ſtill poſſeſſed of vitality. On the contrary, when the blood is coagulated, and cannot be urged forward, it is concluded that the diſcoloured portion is actually in a ſtate of gangrene. A mortified piece of bowel is black, flabby, and gives way under the finger, while in caſes where it is merely diſcoloured, it retains a degree of firmneſs, and preſents a dark brown or chocolate tint.

Sometimes, on laying open the hernial ſac, the omentum contained in it is found ſo diſeaſed, thickened, and altered, that its reduction is either impracticable or improper.

The treatment of ſuch caſes, as well as of others, where the inteſtine in the ſac is affected with mortification, will be preſently conſidered.

It is an invariable rule with ſurgeons, after opening the hernial ſac and reducing the viſcera, to introduce their finger into the ring, ſo as aſſure themſelves that the parts are fairly and completely returned into the cavity of the abdomen. Unqueſtionably prudent as this proceeding is, it juſtifies no exerciſe of manual roughneſs, but ought to be done in the moſt gentle manner poſſible.

It frequently happens, that, after laying open the hernia, its contents are prevented from being at once reduced, by their having become adherent to each other, or to the hernial ſac. When the adheſions are recent and ſlight, they may be broken with the fingers; when old and ſtrong, they require a cautious and ſkilful employment of the knife. The firmeſt and moſt intimate adheſions are thoſe. which form between the omentum and hernial ſac: the bowels are not often firmly connected together.

When reduction is hindered by ſuch adheſions within the ring, as cannot be ſeen, they muſt not be divided, without firſt bringing them into view by a due dilatation, both of the integuments and ring, leſt the protruded viſcera ſhould be wounded in the attempt.

When the caſe is an entero-epiplocele, it is proper to reduce the inteſtine before the omentum. In all caſes, where the latter membrane preſents itſelf, the operator muſt be exceedingly careful not to practiſe any incision upon it, without having firſt convinced himſelf, that there is no piece of inteſtine included between its layers.

When the ſides of the hernial ſac ſeem ſo diſeaſed and thickened, as to be likely to retard the union of the wound, they may be cut away.

The operation being finiſhed, the edges of the incision are to be brought together, and kept in this ſtate, by means of the interrupted ſuture and ſtrips of adheſive plaſter. Gentle preſſure ſhould alſo be made upon the part with a compreſs and the T bandage, for the purpoſe of favouring the union of the ſurfaces in contact, and preventing another protruſion. On the patient being put to bed, he is to be enjoined to lie as quietly as poſſible, and refrain from every ſort of exertion, leſt the viſcera ſhould be forced down again.

The firſt dreſſings need not be taken off till about the fourth day after the operation, unleſs particular ſymptoms ſhould require an earlier removal of them. The wound ought afterwards to be regularly dreſſed once every day. When its edges ſwell, and its circumference becomes red, attended with pain, and a good deal of inflammatory fever, the ſutures ought to be immediately cut, and withdrawn, and the part covered with a ſoft linſeed poultice, inſtead of adheſive plaſters and lint.

No patient, who has been operated upon for a ſtrangulated hernia, ſhould be permitted to get out of bed again before applying a proper truſs; nor can this inſtrument be ever afterwards left off without the patient expoſing himſelf to a conſiderable riſk of the recurring, and that, perhaps, in a greater degree, and, what is worſe, poſſibly in a ſtate of ſtrangulation again. The examples, in which a radical cure is the conſequence of the operation, are not ſufficiently frequent to juſtify any one in neglecting to wear a truſs, eſpecially until the hernia has manifeſted no tendency to deſcend again during a courſe of ſeveral years. When the patient's mode of life is active and laborious, we ſhould ſcarcely preſume to adviſe the omiſſion of the truſs, at any period after the operation, however great the hope might be, that a radical cure had been accompliſhed.

After the operation, the practitioner is not to believe that he has done the whole of his duty towards the patient. He ſhould now promote evacuation from the bowels, by means of clyſters, and ſmall doſes of Epſom or Glauber's ſalt, diſſolved in mint water. Nor ſhould this plan be neglected, although ſtools may follow the operation ſpontaneouſly. The patient's diet muſt alſo be light and ſparing, until he is entirely well. When peritoneal inflammation follows the operation, the ſurgeon muſt employ the moſt active meaſures with the greateſt promptitude. The propriety of this advice will be obvious to every one, who reflects, that the abdominal viſcera are frequently tending to inflammation before the operation, and that the latter proceeding often proves of itſelf a cauſe of peritonitis. When, therefore, the belly becomes tenſe and painful, attended with ſickneſs, hiccough, coſtiveneſs, and febrile ſymptoms, the patient ought to be immediately bled, put into the warm bath, have leeches applied to the ſurface of the abdomen, and try the effect of ſmall doſes of the mildeſt purgative ſalts, aided by clyſters. The effervеſcing draught, combined with opium, is recommended to a patient afflicted, after the operation, with an irritable ſtate of his ſtomach and vomiting. When diarrhœa occurs in the courſe of the treatment, relief muſt be ſought from opium and cordial medicines. See Lawrence on Ruptures, edit. 2.

Method of operating on large Hernia.—The foregoing plan of operating is by no means proper for large, old, and adherent hernia; for, as it is obſerved by the above incomparable writer, "the ſeparation of the preternatural connections is often extremely tedious and difficult; and the violence which muſt neceſſarily be inflicted, in executing this part of the operation, renders the ſubſequent occurrence of inflammation extremely probable. The extenſive ſurface which muſt be expoſed by laying open the whole of a large hernial tumour, conſtitutes a ſource of great danger to the patient, who, in theſe caſes, is generally advanced in years, and therefore leſs liable to withſtand an extenſive inflammation and ſuppuration." The ſame gentleman adverts to the occaſional impoſſibility, in ſuch caſes, of keeping the returned parts in the abdomen, after they have reſided for many years in a hernial ſac. He calls the attention of his reader to the dilated ſtate of the ring, a circumſtance, which muſt remove all expectation of a radical cure from the operation. He is therefore an advocate for removing the ſtricture without opening the tumour. The operation is to be done by making an inciſion of two or three inches in length, through the integuments over the abdominal ring. We are then directed by Lawrence to diſſect down to the faſcia, which covers the hernial ſac, and make an opening in ſuch faſcia! A director is next to be introduced under the tendon, and the part forming the ſtricture cut with a biſtoury, which is to be guided along the groove of the other inſtrument. When this method is found difficult, it is certainly beſt to make a ſmall opening in the ſac near the

ring, by which means the ſurgeon will be enabled to divide the tendon with eaſe. The ſtricture having been thus removed, the parts are to be returned into the abdomen by preſſure, or at leaſt ſuch of them as are capable of reduction. Laſtly, the edges of the inciſion are to be brought together with ſticking plaſter, and united, if poſſible, by the firſt intention. In Mr. Aſtley Cooper's work on hernia, part 1, p. 45 and 46, two convincing caſes are related, one exhibiting the advantage of this plan of operating; the other ſhewing the danger of laying open the whole ſac of a large hernia. Mr. Lawrence records an additional example, in which Mr. Crowther ſucceſsfully operated upon a large ſtrangulated hernia, without laying open the whole of the tumour. According to Mr. Lawrence, the honour of propoſing this method of operating belongs excluſively to Jean Louis Petit, who is ſtated in Garengeot's treatiſe on the operations of ſurgery, publiſhed in 1719, to have adopted the plan the preceding year, in a caſe of crural hernia.

Operation where the Tumour has not paſſed the Ring.—As in this caſe the ſwelling is inconſiderable, the diſeaſe is apt to be miſtaken both by the ſurgeon and the patient; nor can the tumour be expoſed, without dividing the aponeuroſis of the external oblique muſcle. The inciſion through the integuments and aponeuroſis, ſhould be made in a direction parallel to the courſe of the ſpermatic cord within the ring. The ſtricture will always be found ſituated at the inner opening of the ring, and it may be divided either upwards, or upwards and outwards, with invariable ſafety, ſince, in the preſent form of the diſeaſe, the epigaſtric artery is always ſituated at the inner edge of the mouth of the ſac.

Obſervations reſpecting the Treatment of the Omentum found in the Hernial Sac.—We have already obſerved, that when the caſe is an entero-epiplocele, the inteſtine, if found, is to be reduced before the omentum. When, however, it is much diſeaſed, thickened, and indurated, as it is frequently found to be, after remaining any conſiderable time in a hernial ſac, the morbid part is to be cut off. It is accurately explained in Mr. Lawrence's excellent treatiſe, that of all the parts which form the contents of herniæ, the omentum is found to deviate moſt frequently from its healthy ſtructure. Indeed, it poſſeſſes very ſeldom a perfectly natural appearance, when it has been incloſed for ſome time in a hernial ſac. It becomes conſiderably thickened below the ring, and hence is firmer to the feel. That part which reſides in the neck of the ſac is ſometimes thickened and indurated, while the portion below retains its natural texture. When it has ſuffered ſtrangulation for a few days, it often becomes of a dark red, or livid colour, and there is an appearance on cutting it, as if ſome blood were extravaſated in its ſubſtance. Mr. Lawrence conceives, that this is the ſtate which ſurgeons have generally deſcribed under the term of gangrene. An inciſion into the part, under theſe circumſtances, is not attended with any bleeding; but the membrane admits of being expanded as in the natural ſtate. Sometimes, in caſes of hernia, the protruded omentum is converted into a ſolid fatty maſs, where every veſtige of the original ſtructure is loſt. In an old umbilical epiplocele, this gentleman has ſeen it forming a mere lump of fat, equal in ſize to two fiſts. He refers to inſtances related by Schmucker, where it has conſtituted in this manner maſſes of twelve ounces, and a pound and a half in weight, and he notices a caſe, deſcribed by Ponteau, in which forty-five ounces were removed in the operation. The hardneſs of the protruded omentum is occaſionally ſo great, as to have been called ſcirrhous and cancerous by Mr. A. Cooper, and Mr. Pott. (Lawrence on Ruptures, edit. 2. p. 246—248.) In ſome examples, the omentum in the hernial ſac is found actually gangrenous. Suppoſing the omentum to be in a diſeaſed, thickened, or indurated ſtate, its reduction into the cavity of the abdomen would be highly objectionable. In fact, the diſeaſed maſs could not be returned, without an immoderate dilatation of the ring, and, if reduced, would in all probability excite inflammation of the ſurrounding viſcera, and occaſion ſymptoms of a very dangerous deſcription. The unſound portion of omentum ſhould always be cut off with a knife, and when the arteries bleed, they ought to be taken up with a tenaculum, and tied ſeparately with a thread or ſmall ligature. The apprehenſion of hemorrhage, gave riſe to the barbarous practice of including the whole ſubſtance of the omentum in a tight ligature, which was applied juſt above the portion about to be removed. Monſieur Pipelet, in an able production, has expoſed the dangers of this method. (Mém. de l'Acad. de Chirurgie, tom. 3. 394). Our countryman, Mr. Pott, gives in his writings the moſt decided condemnation of the plan. "He has, with great candour related (ſays Mr. Hey) the fatal effect of ſuch a practice in a patient of his own. I ſaw him perform the operation (to which I apprehend he alludes) in the year 1758. The patient was in perfect health, and had an epiplocele, which was only troubleſome by its bulk. The omentum was quite ſound. A tight ligature was put upon it, and the part below was cut off. The ſymptoms which ſucceeded are thus accurately deſcribed (in Mr. Pott's own words); 'I have ſeen a whole train of bad ſymptoms, ſuch as nauſea, vomiting, hiccough, fever, anxiety, reſtleſſneſs, great pain in the belly, and an incapacity of ſitting upright, or even of moving without exquiſite pain, precede the death of a man, whoſe omentum was tied merely becauſe of its enlargement, &c.' Surely (adds Mr. Hey) no ſurgeon who has read this account, can, with a good conſcience, apply a tight ligature upon any conſiderable portion of omentum in a ſound ſtate." (Practical Obſervations in Surgery, edit. 2, p. 180.) This practice, indeed, cannot be reprobated in terms too ſevere; for a frequent effect of it is to bring on a fatal inflammation, and even mortification of the omentum extending within the abdomen, as high as the ſtomach and tranſverſe arch of the colon. Mr. Aſtley Cooper has remarked, with great truth, that it is ſurpriſing this cuſtom ſhould ever have prevailed. The very object of the operation, is to extricate the omentum from its ſtrangulated ſtate, ariſing from the preſſure of the ſurrounding tendon, and no ſooner has this been done, than the blind ſurgeon includes it in a ligature, which produces a more perfect conſtriction, than that which exiſted before the operation was undertaken. Let it not be inferred, however, from any thing here ſtated, that there is no riſk of hemorrhage in the abdomen, when the cut end of the omentum is reduced with its veſſels unſecured. On the contrary, we wiſh as much to praiſe the practice of tying the bleeding arteries ſeparately with a fine ligature, as to cenſure the method of tying the whole thickneſs of the omentum. It is true, that ſeveral authors of celebrity have repreſented the apprehenſion of bleeding as unfounded, and the employment of ligatures as utterly uſeleſs. Thus Monſieur Cagué, chief ſurgeon of the Hôtel Dieu at Rheims, aſſerts, that in nine operations he had cut the omentum in its ſound part without ligature, and that no unfavourable accident had reſulted from this treatment. (Mém. de l'Acad. de Chirurgie, tom. iii. p. 407.) Mr. Pott ſpeaks in the ſtrongeſt terms in favour of this method. He ſays, "the fear of hemorrhage is almoſt, if not perfectly, without foundation, as I have ſeveral times experienced." And again, "I will not pretend to ſay, that there never was a dangerous, or fatal flux of blood from the diviſion of the omentum without ligature; but I can

can truly say, that I never saw one; that I have several times cut off portions of it without tying, and never had trouble from it of any kind, though I have always made the excision in the sound part; and that, from the success which has attended it, I shall always continue to do so, whenever it shall become necessary." (Chirurgical Works, vol. ii. p. 116—118.) However, that there is a degree of danger attending such practice cannot be doubted, after what has occurred to that experienced surgeon Mr. Hey, of Leeds. He informs us, that he has twice, and only twice, cut off a pretty large portion of omentum in its sound part, in the operation for the strangulated hernia, without securing the vessels which were divided, and he expresses his sorrow at being obliged to say, that, in both cases, the reduction of the remaining omentum was followed by hemorrhage, which nearly proved fatal to one of the patients. (Practical Observations in Surgery, p. 188, edit. 2.) Upon the whole, therefore, the most prudent, and least objectionable plan, after cutting off a diseased or gangrenous portion of omentum, is to take up each bleeding artery with a tenaculum, and tie it with a separate small ligature or thread, the end of which may be left hanging out of the wound, until it is loose enough to be withdrawn altogether.

In the operation for a strangulated hernia, it has been proposed to leave the omentum in the wound unreduced, after returning such part as appears clearly to be sound, if a portion of this description be prolapsed. The same advice has been extended to cases where the protruded omentum is in a sound state, of little bulk, and strongly adherent to the hernial sac; and when, from enquiries made of the patient, we learn that this small part has been prolapsed for many years, without disturbing the functions of the abdominal viscera In such a case, Mr. Hey has suffered the omentum to remain, and he found no difficulty in healing the wound, nor any injury afterwards from the application of a well adapted truss. We are sorry that we see no reason to imitate this last method. "It is (as a judicious author observes) attended with no particular advantage, but certainly exposes the patient to the possibility of ill consequences. The omentum, left in the wound, must be liable to injury, inflammation, or disease; and hence arises a source of danger. Unnatural adhesions, formed by this part, have greatly impaired the functions of the stomach. Cases are recorded, where the unfortunate patient has never been able to take more than a certain quantity of food, without bringing on instant vomiting; and even where it has been necessary for all the meals to be taken in the recumbent position, with the trunk curved, and the thighs bent. (See Gunz. Obs. Anat. Chir. de Herniis. Mémoires de l'Acad. de Chirurgie, tom. iii. 406.) To avoid the possibility of such afflicting consequences, we should, after removing any diseased portion, carefully replace the sound part of the omentum in the abdominal cavity, that no obstacle may exist to its regaining that situation, in which its connections with the stomach and colon would naturally place it.

"Since, then, the practice of removing a diseased portion of omentum, of securing the bleeding vessels, and of returning the remainder into the abdominal cavity, has never produced any injury to the patient, nor is likely to be followed by any ill consequence, it must, in the present state of our knowledge, be considered as the most advisable treatment." (Lawrence on Ruptures, p. 260. edit. 2.) We have no doubt that every man of reflection and sound judgment must be quickly struck with the force of these arguments, which to us appear unanswerable.

Treatment when the Intestine in the Sac is mortified.—Sometimes, on opening the hernial sac, the intestine is found to be in a gangrenous state, although the occurrence could not be previously known, owing to the integuments and the hernial sac itself not being affected with the same mischief. In ordinary cases, however, both the skin and sac become gangrenous at the same time with the contents of the hernia. The tumour, which was before tense and elastic, now becomes soft, doughy, emphysematous, and of a purple colour. Sometimes the parts now become spontaneously reduced; but the patient only survives a few hours.

Mr. Astley Cooper has accurately remarked, that, in other instances, the skin, covering the swelling, sloughs to a considerable extent, the intestine gives way, and, as the feces find vent at the wound, the symptoms of strangulation soon subside. When the patient continues to live in these circumstances, the living part of the intestine becomes adherent to the hernial sac, the sloughs separate and come away, and thus an artificial anus is established, through which the feces are commonly discharged, during the remainder of life.

However, though when the patient survives the mortification of an intestinal hernia, he commonly obtains the blessings of life only combined with the loathsome affliction of an artificial anus; yet things sometimes take a still more prosperous course; the feces gradually resume their former route to the rectum, and, in proportion as the artificial anus becomes unnecessary, it is shut up. Many instances of this sort have fallen under our observation in St. Bartholomew's hospital. The chance of a favourable event is much greater in some kinds of hernia than in others. When the strangulation only includes a part of the diameter of the gut, the feces are sometimes only partially discharged through the mortified opening. This quantity lessens as the wound heals, and the patient gets perfectly well. (Louis; Mém. de l'Acad. de Chir. tom. iii.) A small gangrenous spot or two may end in the same manner. Mortification of the cæcum and its appendix, in a hernial sac, has happened several times, without much disturbing the usual course of the feces to the anus, and the patients have very soon recovered. Med. Obs. and Inq. vol. iii. p. 162, &c.

The grand thing on which the establishment of the continuous state of the intestinal canal depends, in all these cases, is the adhesion, which the living portion of the bowel, adjoining the mortified part, contracts with the peritoneum all round. In this manner, the escape of the contents of the bowels into the cavity of the peritoneum becomes in general completely prevented. When the intestine has not already burst, the stricture should be divided; an opening made in the mortified part to let out the feces, and very mild purgatives and glysters administered.

It is an observation of Mr. Astley Cooper's, that the degree of danger attending an artificial anus, depens on the vicinity of the sphacelated part of the intestinal canal to the stomach. Thus, if the opening be in the jejunum, there is such a small extent of surface for absorption between it and the stomach, that the patient dies of inanition.

Let us now suppose, that the mortified state of the intestine has only been discovered, after laying open the hernial sac in the operation. The mischief may only consist of one or more spots; or of the whole diameter of the protruded bowel. In the first case, the proper practice is to divide the stricture, and return the intestine into the abdomen, with the mortified spots towards the wound. Mild purgatives and glysters are then to be exhibited. The most favourable mode

mode in which a caſe of this kind ends, is, when the inteſtinal matter gradually reſumes its natural courſe, after being either partly, or entirely diſcharged from the wound. But, ſometimes, an artificial anus continues for life.

The repeated obſervations of modern ſurgeons have now decided, that no ligature, paſſed through the meſentery to keep the gangrenous part of the bowel near the wound, is at all neceſſary. The parts in the neighbourhood of the ring have all become adherent together, in conſequence of inflammation, at the ſame time that the parts in the hernial ſac mortify; and, of courſe, the partially gangrenous bowel, when reduced, is mechanically hindered, by theſe adheſions, from ſlipping far from the wound. Deſault and De la Faye both confirm the fact, that the inteſtine never recedes far from the ring, and, even were it to do ſo, the adheſions which it ſoon contracts to the adjacent ſurfaces would, as Petit has explained, completely circumſcribe any matter which might be effuſed, and hinder it from being extenſively extravaſated among the convolutions of the viſcera. See Mémoires de l'Acad. de Chirurgie, tom. i. and ii.

Mr. Lawrence, in his late very valuable treatiſe on ruptures, has clearly ſhewn the impropriety of ſewing the ends of the inteſtinal canal together, introducing one within the other, ſupported by a cylinder of iſinglaſs, &c. put in their cavity, in thoſe caſes in which the whole circle of the inteſtine has mortified and been cut away, as is adviſed by the majority of ſurgical writers. "By drawing the inteſtine out of the cavity, in order to remove the dead part, the adheſion behind the ring, on which the proſpect of a cure chiefly depends, muſt be entirely deſtroyed; and new irritation and inflammation muſt be unavoidably produced by handling and ſewing an inflamed part." P. 280. edit. 2.

Inſtead of ſuch practice, this gentleman very judiciouſly recommends dilating the ſtricture, and leaving the ſubſequent progreſs of the cure entirely to nature. The ſloughs will be caſt off, and the ends of the gut are retained by the adheſive proceſs in a ſtate of appoſition to each other, the moſt favourable for their union. Thus there is a chance of the continuity of the inteſtinal canal becoming eſtabliſhed again.

However, in recent wounds of the abdomen, attended with a protruſion of a portion of inteſtine, cut completely acroſs, the bowel is as yet neither inflamed nor adherent to the vicinity of the wound, ſo that it is proper practice to connect the ends together by means of a ſtitch or two made with ſilk or thread, and a ſmall ſewing-needle; and to confine the wounded part of the inteſtine, near the breach in the peritoneum, until adheſions have had time to form.

Mr. A. Cooper has recommended this mode of proceeding, in caſes of hernia attended with mortification of the whole diameter of the bowel; but, for reaſons already ſtated, and many facts referred to in Mr. Lawrence's work, it is to be hoped, that the plan of ſewing the inteſtines, in caſes of hernia with gangrene, will be for ever abandoned. Dictionary of Practical Surgery.

Mr. Hey conjectures, that, in many of the inſtances where a recovery has followed a mortification of the inteſtine, the deſtroyed part of the bowels has conſiſted of the cæcum. He adduces two caſes which fell under his own obſervation, where he concludes that there was little doubt of the prolapſed portion of inteſtine being the head of the colon; and he refers us to another inſtance related in the Medical Obſervations and Inquiries, vol. iii. art. 8, where the patient had a ſcrotal hernia on the right ſide, which, upon being ſtrangulated and neglected, was brought into a ſtate of gangrene. A portion of inteſtine was cut off by the ſurgeon, who then viſited the poor man; and the feces paſſed through the wound for ſome time. However, a complete cure was obtained, and the man lived twenty-five years afterwards, without any return of the hernia. After his death the parts were examined, when the caput coli and appendicula vermiformis were only found wanting. The remaining extremity of the colon adhered to the abdominal ring, and afforded no obſtruction to the paſſage of the feces. Practical Obſervations in Surgery, p. 171. edit. 2.

We have ſtated above, that when the inteſtine in the hernial ſac is found in a completely gangrenous ſtate, the duty of the ſurgeon conſiſts in dividing the ſtricture, and leaving the ſubſequent progreſs of the cure to nature. It is to be underſtood, however, that conſiderable benefit may frequently be derived by giving vent to the contents of the inteſtine. We may ſtate, therefore, with Mr. Aſtley Cooper, that the proper treatment of a mortified inteſtine in ſtrangulated hernia conſiſts in the two following circumſtances:

Firſt, in dividing the ſtricture ſo as entirely to remove the cauſe of ſtrangulation.

Secondly, in making an opening into the inteſtine, ſo as to give a free outlet for the diſcharge of the accumulated feces in the inteſtine within the abdomen. If the ſtricture only is divided, the conſtipation, hiccough, and vomiting continue; but if the inteſtine is opened, the patient, in a few hours, becomes relieved from ſuch ſymptoms. See a caſe communicated to Mr. Hey, by Mr. A. Cooper, and publiſhed in the ſecond edition of the former gentleman's Practical Obſervations, p. 570.

Of the Attempts to effect a Radical Cure of the Bubonocele.—We ſhall take our leave of this ſpecies of hernia, with noticing ſome of the propoſals which have, at different times, been made for the purpoſe of bringing about a radical cure of the diſeaſe. From what has been ſtated in the preceding pages, it muſt appear, that a perſon, afflicted with an inguinal hernia, muſt generally continue the uſe of a truſs the whole, or the greater part of his life, in order to avoid the riſk of ſuffering the viſcera to remain protruded, the examples of a radical cure accompliſhed by truſſes being not very numerous. The hope of ſo deſirable an event from the employment of a truſs, is almoſt confined to caſes of recent ſmall herniæ in young ſubjects. But even here, all chance of the benefit will be entirely loſt, unleſs the rupture be for ſeveral years inceſſantly kept up by a well-made truſs; for the occaſional deſcent of the parts will ſoon deſtroy all tendency of the mouth and neck of the ſac to contract, and become effectually cloſed. Nor does a radical cure, in many inſtances, follow the ordinary operation for a ſtrangulated inguinal hernia, the neceſſity of wearing a truſs continuing as urgent as ever, and the relief only extending to the exiſting dangers brought on by the incarceration. Unapproved, therefore, as moſt of the plans are which have been deviſed for the radical cure of the bubonocele, it muſt be univerſally confeſſed, that the object is one of infinite importance to mankind, and that the diſcovery of a ſafe and ſucceſsful method of attaining it would be little inferior, in point of conſequence, to any of the moſt boaſted improvements in ſurgery. Let it not be imagined, however, that we wiſh to encourage raſh experiments, or to revive any of thoſe cruel practices which were formerly adopted by a murderous ſet of quacks, by whom many an unfortunate patient was duped, mutilated, and deſtroyed.

In the time of Heiſter, there prevailed a baſe and common practice of caſtrating the patient, after putting a ligature round

round the ſpermatic cord and hernial ſac. This mode of attempting a radical cure of the inguinal hernia was barbarouſly ſevere, and what is worſe, was not a real preſervative againſt a relapſe of the diſorder. Beſides, it put the patient to a great deal of agony, and frequently endangered his life.

Another execrable method was practiſed as follows: the viſcera were reduced, and retained in the abdomen by the hand of an aſſiſtant. A cauſtic was then applied to the ſkin oppoſite the ring, ſo as to form a ſmall eſchar. When this ſeparated, if the ſac was not ſufficiently expoſed, the cauſtic was again applied, until it was deſtroyed. The conſequent cicatrix was ſuppoſed to be capable of oppoſing the future deſcent of the abdominal viſcera. The perils of ſuch proceedings have been well depicted by M. Bordenave. Of three patients, who were made the ſubjects of experiment at one of the hoſpitals in Paris, one died, one ſuffered a relapſe, and a third eſcaped with a ſwelling of the ſpermatic cord. Perforation of the inteſtine, and a fatal gangrene of the ſcrotum, were other conſequences of this method. See Mém. de l'Acad. de Chirurgie, tom. v. p. 651, and the ſupplement, page 88 .

An equally objectionable practice was what has made conſiderable noiſe in the world, under the appellation of the royal ſtitch, an operation which conſiſted in firſt expoſing and opening the hernial ſac, and then ſewing it up with the interrupted future; this plan was recommended both as being remarkably efficacious, and not occaſioning a deſtruction of the teſticle.

The punctum aureum, or cure with gold wire, was executed by paſſing a ſmall gold wire round the ſpermatic cord, and upper part of the proceſs of the peritoneum, near the ring of the external oblique muſcle, the teſticle being left in its natural poſition. The gold wire was twiſted by a pair of forceps, ſo as to conſtrict the proceſs of the peritoneum, without compreſſing the ſpermatic veſſels, and keep the inteſtine from falling down again. On this method, Heiſter rightly remarks, that it ſeems uſeleſs and incapable of ſucceeding; for if the wire is not made tight, the inteſtine will not be prevented from protruding, and if it be drawn tight, the ſpermatic cord will be compreſſed, and the teſticle ſlough. Beſides, he objects to leaving the wire permanently applied in this way, as was a part of the ſcheme.

Much as the punctum aureum, in its original form, appears to deſerve condemnation, we conſider an operation, which ſeems to be ſomewhat analogous, as one of the moſt rational propoſals ever made, with a view of effecting a radical cure of the bubonocele. The method alluded to is thus deſcribed in the tranſlation of Heiſter, now before us. "Sermecius, in his treatiſe of lithotomy, mentions another much better method of curing ruptures, without the loſs of the teſticle, which he learnt among the Ruſſians. A longitudinal inciſion was firſt made in the inguen; and the proceſs of the peritoneum, containing the inteſtine, was then freed from the parts; after returning the inteſtine, and drawing the ſaccus ſtrongly out of the wound, it was tied with a ſtrong thread, as near as poſſible to the abdominal muſcles. The ligature was then left hanging out of the wound, which was dreſſed in the uſual manner, till it digeſted off of itſelf. By this method, he aſſures us, many have been cured without injury to the teſticle, or ſpermatic veſſels. This method is by Sermecius recommended as of the greateſt uſe in adults, where the inteſtine cannot be retained in the abdomen by bandage. I have, ſome time ſince, received a treatiſe from an Helvetian, whoſe name is Freitage; in which he mentions this method, and ſays it was practiſed often by his father with great ſucceſs, as deſcribed by Sermecius; with this difference only, that he perforated the ſaccus with a needle and thread before he tied it up. This is a very uſeful and neceſſary caution to prevent the ligature's ſlipping." (See Heiſter's Syſtem of Surgery, part 2. chap. 119.) The moſt ſimple and ſafe method of attempting this operation would undoubtedly be, after reducing the bowels, to make an inciſion about two inches long, through the ſkin over the neck of the ſac, and then to uncover the latter by diſſection to an extent ſufficient to enable the operator to paſs a needle and ligature through it, immediately in front of the ſpermatic cord. The neck of the ſac is then to be firmly tied, juſt as is done to an artery. One ſhould not expect, *à priori*, that ſo ſmall a cut as is requiſite, and tying a part of ſuch little importance in the animal economy as a hernial ſac, would be likely to be frequently followed by dangerous ſymptoms. We find it aſſerted that ſucceſs has often attended the method, nor, until experience proclaims the contrary, can we conſider it as irrational and unworthy of notice. At the ſame time, we wiſh it to be underſtood that we ſhould only deem the experiment juſtifiable in particular caſes, where a truſs fails in keeping the hernia properly reduced, and where the patient, after having things fairly explained to him, is willing to encounter whatever riſk there may be. In the courſe of time the operation might be more extenſively adviſed, after its frequent ſucceſs had been well demonſtrated. Perhaps, alſo, the common operation for ſtrangulated hernia might oftener terminate in a radical cure, were that opportunity taken to tie the neck of the ſac. We may add to this account, that Schmucker, the celebrated Pruſſian ſurgeon, has deſcribed and practiſed this mode of operating. He has expoſed the hernial ſac by an inciſion through the ſcrotum; he has diſſected it carefully away from the integuments and ſpermatic veſſels; he has opened it, and puſhed up the protruded parts, and then cut off the remainder below the ligature. He did this with ſucceſs in two caſes. Default alſo cured a congenital bubonocele at the Hôtel Dieu, by placing a ligature on the mouth of the ſac. Chir. Wahrnehm. b. 2. p. 236. Recueil Périodique, tom. ix. p. 230

With reſpect to the plan of laying open the hernial ſac, it appears to us equally unneceſſary and unwarrantable. It is well known, and has been proved by many caſes, recorded by Arnaud, Sharp, Petit, Abernethy, &c. that dangerous inflammation of the peritoneum and bowels, frequently ending in death, is apt to be excited by merely opening the ſac of a hernia, and this even though a tumour, before the operation, be entirely free from pain and other complaints uſually attending its ſtrangulated ſtate.

Of the Femoral or Crural Hernia.—The femoral or crural hernia is that to which women are moſt liable. It ſeldom occurs in male ſubjects, who, on the other hand, are very ſubject to bubonoceles, from which females are almoſt entirely exempt. It conſiſts of a protruſion of ſome of the abdominal viſcera under the pubic extremity of Poupart's ligament. It rarely acquires a large ſize, and is generally of a globular ſhape, while an inguinal hernia is more or leſs oblong. Anatomical examinations prove, that the aperture through which the parts eſcape is exceedingly ſmall, and hence, we muſt not be ſurpriſed at the remarkable rapidity with which the ſymptoms ſtudily advance.

In order that the reader may have accurate ideas reſpecting the femoral hernia, it is neceſſary for him to know, that the inferior edge of the aponeuroſis of the external oblique muſcle is extended across, under the name of the crural arch, or Poupart's ligament, from the anterior ſuperior ſpinous proceſs of the ilium to the ſpine of the pubes. The ſpace under

under the crural arch is occupied by the iliacus internus and pſoas magnus muſcles, the crural veſſels, the anterior crural nerve, the lymphatics of the lower extremity, and one or more abſorbent glands. The cleareſt account of the parts concerned in the femoral hernia is that contained in Mr. Lawrence's excellent treatiſe. The aponeuroſis of the external oblique muſcle, as this gentleman deſcribes, "is fixed by a broad inſertion into the pubes; this attachment, which begins at the ſpine, runs along the criſta of the bone. Its poſition, therefore, in the erect ſtate of the body, is nearly, though not entirely, horizontal; conſequently its two margins ſhould be deſcribed by the epithets anterior and poſterior: it being remembered at the ſame time, that the former of theſe is rather higher than the latter. That part of it which is fixed to the ſpine of the bone has the appearance of a firm and ſomewhat round tendinous cord; its inſertion into the criſta of the pubes is effected by means of a thinner portion, which gives to the tendon a clearly defined ſharp edge at its poſterior margin. The latter diviſion of the tendon muſt of courſe be ſituated much more deeply from the ſurface than the former. Its ſharp wiry edge can be felt very diſtinctly by paſſing the finger under the crural arch, on the inner ſide of the femoral vein, either from above or below.

"If we deſcribe a diſtinct part under the name of Poupart's ligament, we ſhould ſtate, that when it approaches the bone it becomes ſuddenly broader; that it is fixed by this broad portion along the whole length of the ſpine and criſta of the pubes; that it has a rounded and ſtrong anterior edge, a thin and ſharp poſterior margin, and that the former of theſe is nearer to the ſurface, while the latter is comparatively deeply ſeated. The breadth of this part varies in different ſubjects; it is generally from three quarters of an inch to an inch. Sometimes, as Gimbernat has ſtated, it meaſures more than an inch. Dr. Monro has obſerved, that it is broader in the male than in the female ſubject; and from this ſtructure he explains in part the more rare occurrence of this rupture in the male.

"The anterior edge of Poupart's ligament repreſents a ſtraight line, drawn from the ilium to the pubes: the poſterior border has an arched form towards the latter bone, in conſequence of the expanded portion which is fixed to its criſta. Hence has ariſen the appellation uſed by Gimbernat of the *crural arch*.

"The parts which have been already enumerated fill up the ſpace between the crural arch and the os innominatum. The crural veſſels, placed in the ſmooth ſlope on the front of the pubes, are ſituated laterally with reſpect to each other. Next to the thin end of the arch is the vein, with the artery lying externally to it. An abſorbing gland is ſometimes found between the vein and the tendon; or elſe this ſpace is only occupied by looſe cellular ſubſtance.

"Since the tendon of the obliquus externus is ſtretched like a cord between two diſtant points, and there is a wide ſpace under it, the ſtudent will ſuppoſe that protruſions of the abdominal viſcera under its edge muſt happen very readily. This is effectually prevented by the attachments of certain faſciæ, confining the tendon cloſely to the ſurface of the parts which it covers.

"The iliacus internus, and that portion of the pſoas magnus which lies by its ſide, are covered by a thin faſcia, ariſing inſenſibly on the ſurface of the muſcles, and intimately connected with the expanded tendon of the pſoas parvus. This faſcia is in immediate contact with the muſcles; the iliac veſſels and the peritoneum cover its anterior ſurface, and are connected to it by a looſe cellular ſubſtance. It is attached on the inſide to the line which bounds the ſuperior aperture of the pelvis; on the outſide, to the anterior portion of the inner edge of the criſta ilii; and below, to the poſterior margin of the crural arch. The latter inſertion terminates in a pointed form juſt over the paſſage of the vein. Another part of the faſcia is continued over the bone, and behind the artery and vein into the thigh, where it forms the poſterior portion of the ſheath, including thoſe veſſels, and is continuous with the faſcia lata.

"In conſequence of the ſtructure juſt deſcribed, the crural arch is firmly confined in its ſituation, and the protruſion of the abdominal viſcera under it is obviated. A ſmall ſpace, however, is left between the iliac vein and the thin border of the tendon, not cloſed towards the abdominal cavity, and, conſequently, affording an opportunity for the occurrence of herniæ. This, which is either filled with cellular ſubſtance, or an abſorbing gland, is called by Gimbernat the *crural*, and by Mr. Hey, the *femoral ring*. The ſpace in queſtion is bounded above and in front by the crural arch; below and behind by the pubes; on the internal or meſial ſide by the thin border of the tendon; and on the outer, or lateral aſpect, by the crural vein.

"The faſcia lata, or faſcia of the thigh, has two diſtinct inſertions at the upper and anterior part of the limb. It is attached to the front edge of the pubes, over the origin of the pectineus, the fibres of which it cloſely covers, and it is alſo fixed to the front of the crural arch. The former of theſe is continuous, behind the femoral veſſels, with the iliac faſcia; the latter is not inſerted along the whole length of the tendon, its attachment ceaſing on the inner ſide of the veſſels, which it covers anteriorly. Here, therefore, the femoral artery and vein are interpoſed between the two diviſions.

"Under the anterior portion of the crural arch a large oval depreſſion is found on the front of the thigh, on the ſurface of the pectineus muſcle. At the upper, outer, and lower ſides, this hollow is bounded by a ſharp and defined edge of the faſcia; but it has no ſuch boundary internally. Where the attachment of the faſcia lata to the crural arch terminates, it forms a diſtinct ſemi-lunar, or creſcent-ſhaped fold. The upper end, or horn of this creſcent, is the laſt portion of the faſcia towards the inſide, connected to the crural arch, and it bends under the tendon ſo as to unite with the thin portion or border at its commencement. The concavity is turned towards the oppoſite limb, and the inferior horn is ſituated downwards and outwards on the thigh. This fold covers the femoral artery and vein juſt under Poupart's ligament, excepting a ſmall portion of the latter at its inner ſide. The lower horn of the creſcent is continuous with a ſecond ſemi-lunar edge, having its concavity turned upwards, and forming the inferior boundary of the oval ſpace. Here the two diviſions of the faſcia lata are continuous. The great ſaphena vein paſſes over the laſt mentioned fold, and opens into the femoral, where that is not covered by the faſcia lata. On the inner ſide, the oval depreſſion is not defined by any boundary. The faſcia covering the pectineus is continued behind the femoral veſſels, and the handle of a ſcalpel may be paſſed on its ſurface in this direction, ſo as to elevate them. The femoral vein is covered by a denſe fibrous ſubſtance, which completes its ſheath in part, where it receives the ſaphena.

"The femoral artery and vein, ſurrounded and connected by a compact fibrous ſubſtance, are covered in front, immediately under the crural arch, by that part of the faſcia lata which terminates in the ſemi-lunar edge; and they lie on the production continued over the pubes from the iliac faſcia.

The latter is united externally to the veſſels, to the ſheath, including the ſartorius. The covering of the vein on the inſide, or concavity of the ſemi-lunar edge, has been juſt mentioned.

"Along the whole bend of the thigh, a thin and irregular faſcia, or condenſed cellular texture, intervenes between the parts now deſcribed and the integuments. This covers the upper part of the faſcia lata, the crural arch, and the lower portion of the aponeuroſis of the obliquus internus. It contains different layers intermixed with the abſorbent glands of the lower extremity, and with the ſuperficial veins which join the trunk of the ſaphena." See Lawrence on Ruptures, edit. 2, chap. 14. p. 334—341. The excellence of the foregoing quotation muſt ſerve as an apology for its length; we were unwilling to mutilate ſo incomparable a deſcription by abridgment.

Having introduced an explanation of the parts in which the femoral hernia is ſituated, it becomes our duty to enter upon a more particular account of this kind of rupture, previous to the obſervations on the treatment.

We find, then, that the viſcera are protruded through the crural ring, which lies under the crural arch, between its thin edge and the external iliac veins. A protruſion of the viſcera, under any other part of the tendon, is prevented by the attachment of the iliac faſcia. The hernia, having paſſed through the crural ring, riſes above its edge, and therefore, as Mr. Hey has obſerved, if a ſurgeon attempts to reduce it when ſtrangulated, by puſhing it upwards, he effectually fruſtrates his intention. The viſcera deſcend from the abdomen at firſt nearly in a perpendicular direction, and come into the hollow in front of the pectineus. They then come forwards to the ſurface, ſo as to lie in general in front of the crural arch. The neck of the ſac, or that portion of it lying under Poupart's ligament, is generally about half an inch in length, and it is obvious that the ſtrangulation muſt have a very deep ſituation, ſince it occurs exactly where the neck of the ſac communicates with the abdomen. The tumour is ſituated in front of the pectineus, and of the faſcia lata. Much praiſe is due to Mr. Lawrence for his having corrected the common miſtaken notion, that the femoral rupture lies under the faſcia of the thigh; an error which was apt to lead to dangerous conſequences, by encouraging the ſurgeon to make his firſt inciſions with unwarrantable boldneſs. One variety of femoral hernia deſcribed by Mr. Aſtley Cooper (part ii. p. 20, Plate VIII. fig. 1.), and in which the parts deſcend into the ſheath of the crural veſſels, forms, however, an exception to the foregoing ſtatement. In this caſe the tumour is ſituated under the faſcia lata, is more obſcure to the feel, and has not a defined edge.

Although the hernial ſac, in ordinary caſes, is not covered by the faſcia lata, yet, what Mr. Aſtley Cooper has named the *faſcia propria* is ſpread over the whole of it to its very neck, being of a thicker ſtructure than the peritoneum.

The upper end of the falciform proceſs paſſes over the upper and outer part of the neck of the tumour; it is then, as Mr. Lawrence deſcribes, folded under the crural arch, and continues into the thin poſterior border. The iliac vein lies on the outer ſide of the neck of the ſac; the pubes is directly behind it; and its upper and inner parts are bounded by the thin poſterior edge of Poupart's ligament. Gimbernat firſt diſcovered, that it was this edge which produces the ſtrangulation. The ſtricture is alſo in ſome meaſure formed by the ſemi-lunar portion of the faſcia, which is attached to the crural arch at the point where the protruſion happens. A relaxation of this part of the faſcia, therefore, affords a degree of relief.

The epigaſtric artery runs obliquely upwards and inwards, on the outſide of the hernial ſac, about half an inch from its neck. When the obturator artery ariſes from the epigaſtric, it may either proceed on the outer or inner ſide of the ſac, in which laſt circumſtance, taking into the account the iliac vein, the neck of the ſac would be ſurrounded by a large veſſel in three-fourths of its circumference. The ſpermatic cord, or round ligament of the uterus, paſſes over the upper part of the tumour, about half an inch from the neck of the ſac. Lawrence on Ruptures.

The femoral hernia is uſually of a rounder form, and leſs bulk when ſtrangulated, than the ſcrotal hernia. Mr. Hey has repeatedly ſeen it reſembling an enlarged inguinal gland. It is apt alſo to extend in a horizontal rather than a vertical direction. It is the common rupture of the female ſex, ſo much ſo, that almoſt all the inſtances of ſtrangulated inteſtinal hernia in females, which have occurred in Mr. Hey's practice, have been of the femoral kind.

From the ſmall ſize of the crural ring, we cannot wonder that the ſtricture ſhould alſo be greater than that which is uſually met with in caſes of bubonocele. Mr. Hey, in the laſt edition of his Practical Obſervations, informs us, that he has now performed the operation for the femoral hernia, 16 times in the female, and twice in the male ſubject; and that he always found great difficulty in introducing the tip of his finger into the femoral ring, for the purpoſe of conducting the knife. Nay, he has thrice found this introduction impracticable, and has been under the neceſſity of making uſe of a director. There are ſome very erroneous ſtatements on this ſubject in Pott's works, in which we are adviſed to reduce the prolapſed parts, without dividing the ſtricture, a thing which is, for the moſt part, utterly impoſſible in the operation for a ſtrangulated femoral hernia.

The opening through which a crural hernia takes place is very ſeldom increaſed to any great ſize, as happens with reſpect to the abdominal ring in large and old ſcrotal ruptures. The ſwelling is likewiſe remarkable for being in general exceedingly ſmall. Exceptions to this account, however, are upon record. See Hey's Practical Obſervations; Cooper, part ii. p. 6.; and Lawrence on Ruptures, edit. 2. p. 358.

A crural hernia moſtly contains inteſtine, and very ſeldom omentum alone. When the tumour is ſmall, and includes a piece of omentum, it may be miſtaken for an enlarged inguinal gland. If the ſwelling has appeared ſuddenly after a violent effort; if it increaſes on exertion, and diminiſhes, or diſappears on preſſure, or in the recumbent poſture; if an impulſe be felt when the patient coughs, and inteſtinal affections have been cauſed by it, the caſe muſt be a hernia. An enlarged gland is uſually more indurated than a hernial tumour; it comes on gradually, does not vary in ſize, and cauſes no diſturbance of the alimentary canal. Every ſenſible ſurgeon will immediately coincide with a late excellent author, that, in all caſes of doubt, when ſymptoms, reſembling thoſe of ſtrangulation, prevail, and do not yield to the uſual remedies, the ſurgeon is called upon to operate. No great inconvenience can ariſe from cutting down upon an enlarged gland; while the patient's life would be endangered by putting off the operation, in the event of the caſe being a rupture. Lawrence, p. 360.

The femoral hernia is liable to be miſtaken for a bubonocele, by which error the ſurgeon would be led to direct the preſſure very wrongly in the taxis, and in the operation might make ſome dangerous or fatal blunder with his knife. The caſes may always be diſcriminated by recollecting, that if the ſwelling of a crural hernia be drawn downwards, the crural arch may be traced paſſing over the neck of the ſac, while in bubonocele it extends under that part. The ſpine

ſpine of the os pubis, which is behind and below the neck of the ſac in an inguinal hernia, is on the ſame horizontal level, and rather within it in the crural rupture. A varix of the femoral vein may be diſtinguiſhed from a crural hernia by the diſappearance of the ſwelling on the patient's lying down, and its recurrence again as ſoon as the vein is preſſed upon above Poupart's ligament. A pſoas abſceſs may be known by the fluctuation of the matter, the preceding pain in the loins and ſhivering, the abſence of inteſtinal complaints, &c.

Treatment of the Femoral or Crural Hernia.—A femoral rupture preſents the ſame general indications as any other hernia. When reducible, it is to be immediately returned into the cavity of the abdomen, and kept up with a ſuitable truſs. In reducing the parts, the ſurgeon ſhould bear in mind that they firſt paſs downwards, and then forwards, riſing ſomewhat above the crural ring. The method of reduction which Mr. Hey has uſed with moſt advantage, is this: after placing the patient upon the ſide oppoſite to that affected with the hernia, with the body bent forwards, and the affected thigh brought to a right angle with the trunk, and thrown acroſs the oppoſite knee with the toes turned inwards; he places the fingers of both his hands upon the upper part of the hernia, and then pulls it gradually but gently downwards. By this method the hernia is turned round the edge of the falciform proceſs of the faſcia lata, and by continuing the preſſure of the fingers it aſcends through the crural ring into the abdomen.

A crural hernia is radically cured by truſſes ſtill more ſeldom than a bubonocele: indeed the crural ring is too deeply ſituated to be much affected by external preſſure.

When a femoral rupture is ſtrangulated, the treatment ſhould be regulated by the ſame principles which apply to other caſes of incarcerated hernia. The taxis is to be attempted, and if this fail, bleeding, the warm bath, cold applications, tobacco clyſters, &c. are to be tried, ſubject to ſuch conſiderations as have been already detailed in a foregoing part of this article. No ſooner have theſe means proved ineffectual, after being fairly tried, than it becomes unjuſtifiable raſhneſs, on the part of the ſurgeon, to waſte any more time upon plans which cannot be depended upon. The operation is now urgently required, and ought on no account to be delayed, ſince the uſual tightneſs of the ſtricture, in theſe caſes, at once precludes all hope of relief from any other proceeding, and renders the progreſs of the ſymptoms more rapid. All the lateſt and beſt writers ſeem to agree, that the delay of the operation is even more dangerous in the crural than the inguinal hernia, as death is very generally ſooner induced by the former than the latter diſeaſe. Mr. Aſtley Cooper has related a caſe where death took place in 21 hours and a half from the acceſſion of the ſymptoms. He mentions two other inſtances, in which, at the end of 40 hours, the parts were too much altered to admit of being reduced. Indeed, this eminent practitioner is ſo ſtrongly impreſſed with the bad effects of delay, that he declares, that if he himſelf were the ſubject of a crural hernia, he would only try the effect of tobacco clyſters, and if they did not ſucceed, he would have the operation performed in 12 hours from the acceſſion of the ſymptoms. Part ii. p. 22.

Operation for the Femoral or Crural Hernia.—The operation for the femoral hernia, like that for the bubonocele, conſiſts in making an inciſion through the integuments, laying open the hernial ſac, dividing the ſtricture, and reducing the viſcera, when they are neither in a mortified nor diſeaſed ſtate. The vicinity of ſo many large blood-veſſels to the neck of the ſac, and the depth of the part forming the ſtricture, however, render the operation more delicate and difficult than that for the bubonocele; or at leaſt accurate anatomical information, and much caution, are requiſite in its performance.

The diviſion of the integuments is to begin an inch above the crural ring, and be continued in a direction downwards and outwards. This plan will afford ſufficient room to get at the ſtricture, without adopting Mr. Aſtley Cooper's method, in which the inciſion of the integuments is to begin "an inch and a half above the crural arch, in a line with the middle of the tumour, and be extended downwards to the centre of the tumour below the arch. A ſecond inciſion, nearly at right angles with the other, is next made, beginning from the middle of the inner ſide of the tumour, and extending acroſs to the outer ſide, ſo that the form of this double inciſion will be that of the letter T reverſed." Mr. Aſtley Cooper next diſſects up the angular flaps and reflects them.

Conſiderable embarraſſment may often be noticed in the deportment of many operators, who, from not knowing that the hernial ſac has any exterior inveſtment beſides the integuments, imagine the ſac to be opened on a diviſion of the faſcia under the ſkin being made. Even fatal blunders have thus been made, the unopened ſac and viſcera in a ſtrangulated ſtate being puſhed together into the abdomen. According to Mr. Aſtley Cooper, "the firſt inciſion expoſes the ſuperficial faſcia, which is given off by the external oblique muſcle, and which covers the anterior part of the hernial ſac; but if the patient is thin, and the hernia has not been long formed, this faſcia eſcapes obſervation, as it is then ſlight and delicate, and adheres cloſely to the inner ſide of the ſkin. When this faſcia is divided, the tumour is ſo far expoſed, that the circumſcribed form of the hernia may be diſtinctly ſeen; and a perſon, not well acquainted with the anatomy of the parts, would readily ſuppoſe that the ſac itſelf was now laid bare. This, however, is not the caſe, for it is ſtill enveloped by a membrane, which is the faſcia, that the hernial ſac puſhes before it, as it paſſes through the inner ſide of the crural ſheath. This membrance, the faſcia propria, is to be next divided longitudinally from the neck to the fundus of the ſac; and if the ſubject is fat, an adipoſe membrane lies between it and the ſac, from which it may be diſtinguiſhed by ſeeing the cellular membrane paſſing from its inner ſide to the ſurface of the ſac.

"This is, in my opinion, the moſt difficult part of the operation; for the faſcia propria is very liable to be miſtaken for the ſac itſelf, ſo that when it is divided, it is ſuppoſed that the ſac is expoſed, and the inteſtine is laid bare; following upon this idea, the ſtricture is divided in the outer part of the ſac, and the inteſtine, ſtill ſtrangulated, is puſhed with the unopened ſac into the cavity of the abdomen.

"The hernial ſac, being expoſed, is to be next opened; and, to divide it with ſafety, it is beſt to pinch up a ſmall part of it between the finger and the thumb; to move the thumb upon the finger, by which the inteſtine is diſtinctly felt, and may be ſeparated from the inner ſide of the ſac; and then to cut into the ſac, by placing the blade of the knife horizontally. Into this opening a director ſhould be paſſed, and the ſac opened from its fundus to the crural ſheath. See A. Cooper on Crural and Umbilical Hernia.

Notwithſtanding the obſervations and advice of Mr. Pott, the moſt experienced ſurgeons of the preſent time almoſt always find, that, after laying open the hernial ſac, the parts cannot be reduced without a diviſion of the crural ring, the ſtricture being in general exceedingly tight. However, were a caſe to preſent itſelf in which the reduction could eaſily be accompliſhed without cutting the ſtricture, the ſurgeon ought undoubtedly to take advantage of the circumſtance. But on no account is he juſtified in omitting to dilate the opening, and making long and tedious manual attempts

tempts at reduction, to the great and ſerious injury of the protruded parts. Nothing is more certain, than that it is far ſafer and more prudent to employ the knife than do any thing hurtful to the prolapſed viſcera.

There has not been any better plan propoſed of dividing the ſtricture in the femoral hernia than that which was recommended by Don Antonio de Gimbernat, ſurgeon to the king of Spain.

"Introduce, along the internal ſide of the inteſtine, a cannulated or grooved ſound, with a blunt end, and a channel of ſufficient depth. This is to be directed obliquely inwards till it enter the crural ring, which will be known by the increaſed reſiſtance, as alſo, when its point reſts upon the branch of the os pubis. Then ſuſpend the introduction; and, keeping the ſound (with your left hand, if you are operating on the right ſide, and *vice verſâ*) firmly reſting upon the branch of the os pubis, ſo that its back ſhall be turned towards the inteſtine, and its canal to the ſymphyſis pubis, introduce gently, with your other hand, into the groove of the ſound, a biſtoury, with a narrow blade and blunt end, till it enter the ring. Its entry will be known, as before, by a little increaſe of reſiſtance. Cautiouſly preſs the biſtoury to the end of the canal; and, employing your two hands at once, carry both inſtruments cloſe along the branch to the body of the pubis, drawing them out at the ſame time. By this eaſy operation, you will divide the internal edge of the crural arch at its extremity, and within four or five lines of its duplicature, the remainder continuing firmly attached by the inferior band or pillar, of which it is the continuation. This ſimple inciſion being thus made without the ſmalleſt danger, the internal border of the arch, which forms the ſtrangulation, will be conſiderably relaxed, and the parts will be reduced with the greateſt eaſe." See p. 45, 46.

Mr. Hey notices, that the part to be divided, for removing the ſtricture, lies deeper than the abdominal ring, and on this account the diviſion is made with more difficulty. He adviſes the ſurgeon to take eſpecial care to introduce his finger, or director, within that part where he finds the ſtricture to be the greateſt; which is the moſt interior part of the wound. "A very ſmall diviſion of the part, which cauſes the ſtricture, is uſually ſufficient to enable the ſurgeon to reduce the prolapſed parts, if he keeps in mind the proper method of reducing the femoral hernia; and, conſidering the vicinity of the blood-veſſels, and other important parts, to this ſpecies of hernia, the diviſion of the femoral ring ought to be no greater than is neceſſary for the eaſy reduction of the hernia." This gentleman adviſes the diviſion of the ring to begin at that part which is neareſt the ſymphyſis of the pubes, and he has uſually made the inciſion upwards and inwards.

Although Gimbernat's mode of dividing the ſtricture has numerous advocates, it is proper to mention that it has not received the approbation of that diſtinguiſhed ſurgeon, Mr. Aſtley Cooper. Mr. Hey alſo finds fault with Gimbernat's manner of operating. He adverts to this ſurgeon's own confeſſion, that the bladder, if diſtended with urine, and the uterus, in a pregnancy of four months and upwards, are in danger of being wounded. Mr. Hey acquaints us that the firſt of theſe accidents occurred in an operation performed after this method by a ſurgeon of ſome eminence, while he has experienced that the operation may be done with ſafety during the fifth month of pregnancy, by making the inciſion upwards and inwards. He is likewiſe of opinion that the inteſtine is expoſed to great and unneceſſary danger by the manner in which Gimbernat divides the ring, as there is nothing to prevent the inteſtine from ſliding over the edge of that part of the knife which is introduced beyond the ſtricture. (See Practical Obſervations, ed. 2. p. 155, 156.) We have no heſitation in declaring our own belief, that, in the hands of any man of ordinary ſkill, Gimbernat's method is perfectly ſafe. The idea of wounding the inteſtine ſeems to us to reſt upon no foundation; for, as may be ſeen by a reference to Gimbernat's own directions, a probe-pointed knife is to be uſed, the back of the director is to be turned towards the inteſtine, and the inciſion is to be directed away from this latter part.

Mr. Lawrence conſiders "the beſt and ſafeſt method of executing this part of the operation, to be that of dividing the thin poſterior border of the crural arch in the part firſt recommended by Gimbernat, that is, as nearly as we can, to its inſertion in the pubes. This is the very part which conſtitutes the ſtricture, and where a ſmaller diviſion will accompliſh our object than in any other ſituation; yet, half an inch in all caſes, and, in many inſtances, a longer ſpace may be gained in this quarter, without affecting the main inſertion of the ligament into the ſpine of the bone. The crural arch, therefore, is leſs weakened by a diviſion of this than of any other part. Treatiſe on Ruptures, p. 379. ed. 2.

The advice given us upon this point by Mr. Aſtley Cooper, is to divide the ſtricture obliquely inwards and upwards, at right angles, to the crural arch.

When the blood-veſſels have their ordinary diſtribution, cutting the moſt interior part of the ſtricture, in the direction adviſed by Gimbernat, is unattended with danger; but when, as ſometimes happens, the obturator artery ariſes from the epigaſtric, and runs along the inner margin of the ſac, even this plan is objectionable. In order to avoid all riſk of wounding the obturator artery, in the event of its taking this courſe, a new mode of operating has been propoſed. An inciſion is to be made through the aponeuroſis of the external oblique muſcle juſt above Poupart's ligament, and in a direction parallel to that part. Through this aperture a curved grooved director muſt be introduced, and, keeping it cloſely preſſed againſt that ligament, muſt be puſhed down through the crural ring. Upon this director the tendon is to be divided to the requiſite extent with a curved knife. See Edin. Med. and Surgical Journal, vol. ii. p. 205.

Upon this propoſal, it is remarked by Mr. Hey, that if this deviation from the uſual courſe of the obturator artery were more frequent than it appears to be, he ſhould ſtill think there was no occaſion to have recourſe to an operation attended with ſo much difficulty and uncertainty. In this procedure the patient muſt be ſubjected to the pain of a double operation; one below and another above Poupart's ligament. The director muſt be thruſt down betwixt the parts forming the ſtricture and the hernial ſac, which often adhere firmly to each other. In this attempt the courſe of the director muſt be often interrupted by the projection backwards of Gimbernat's ligament. And after all, the operator cannot be certain that the director has paſſed before the obturator artery; and, conſequently, cannot know that he has gained any advantage by this painful and troubleſome proceſs. (Practical Obſervations in Surgery, edit. 2. p. 157.) It appears to us that, upon the whole, this propoſal ſhould not be followed up in practice, and that the plan would be exceedingly likely to induce a dangerous degree of peritoneal inflammation.

The method, which we prefer, is that recommended by Gimbernat, and which conſiſts in dividing the moſt internal part of the crural ring in the direction inwards. Should the obturator artery be felt pulſating at the inner ſide of the neck of the ſac, the operator muſt of courſe uſe his utmoſt endeavour to avoid it. Perhaps here it might be prudent to divide the part of Poupart's ligament attached to

to the angle of the pubes, and extend the inciſion as far as neceſſary, by cutting cautiouſly from without inwards. More apprehenſions, however, have ariſen from the occaſional deviation of the obturator artery from its common courſe than appear to be well founded. Monro computes, that the obturator artery may ariſe from the epigaſtric once in twenty-five or thirty ſubjects. But even ſuppoſing it originates more frequently, it then does not always deviate from its uſual courſe along the outſide of the ſac. Mr. A. Cooper acquaints us, that in all the caſes which he has himſelf diſſected, where this variety exiſted with crural hernia, the obturator artery paſſed into the pelvis on the outer ſide of the neck of the ſac, entirely out of the reach of any danger from the knife. On Crural Hernia, p. 1.

Congenital Hernia.—The name of inguinal congenital hernia has been given to that ſpecies of the diſeaſe, where the protruded viſcera have the tunica vaginalis as a hernial ſac, and lie in immediate contact with the teſticle.

The manner in which this rupture was formed was not underſtood by the ancient ſurgeons, who, obſerving that the ſac of a common ſcrotal hernia lay upon the tunica vaginalis, concluded that the viſcera had made their way into its cavity by preſſure. It is now univerſally known that the teſticle is orginally placed near the kidney, where it receives a covering of peritoneum like the other abdominal viſcera; that in the latter months of pregnancy it deſcends through the abdominal ring into the ſcrotum, carrying with it a portion of peritoneum; that the communication between the membranous bag holding this gland, and the abdominal cavity, is deſtroyed before the time of birth; and that the peritoneal coat which ſurrounded the teſticle in the abdomen forms the tunica albuginea, while the looſer proceſs that paſſes with it into the ſcrotum makes the future tunica vaginalis. The obliteration of the communication between the cavity of the tunica vaginalis and abdomen is moſtly effected before birth, though occaſionally not till afterwards, and ſometimes even as late as manhood.

The epithet *congenital* ſeems liable to objection, as conducing to an erroneous ſuppoſition, that the hernia is actually formed at the period of birth. It is indeed true, that while a communication remains open between the tunica vaginalis and abdomen *after birth*, a protruſion of the viſcera muſt be exceedingly apt to take place *on the operation of the uſual exciting cauſes*. But ſince in the fetal ſtate theſe cauſes cannot act, it would be abſurd to ſuppoſe that the rupture was ſtrictly congenital. Immediately, however, the function of reſpiration begins, the diſeaſe may be produced, and although it is uncommon for it to exiſt at the time of birth; it generally makes its appearance ſoon after this event; but it may be delayed even for many years. An example is recorded by Mr. Hey, where a hernia congenita was firſt formed in a young man aged ſixteen, whoſe right teſtis had, a little while before the attack of the diſeaſe, deſcended into the ſcrotum. Richeraud alſo makes mention of the caſe of another young man, twenty years of age, whoſe teſticles, which were previouſly concealed in the abdomen, and ſituated behind the rings, were propelled through theſe openings on his making a violent effort to leap over a broad ditch. The peritoneum was carried down with theſe organs, and conſtituted pouches, into which the viſcera were ſoon afterwards protruded. The hernia congenita, therefore, is rather improperly named, ſince the diſeaſe does not uſually occur till after birth, and ſometimes not till long after it. It might be better to characterife the rupture by the peculiarity of its being contained in the tunica vaginalis, which ſerves in every reſpect as the hernial ſac. See Richeraud Noſographie Chirurgicale, tom. iii. p. 399. edit. 2.

We have ſaid that the hernia congenita does not commonly take place till after the period of birth, and that its formation requires the operation of the ordinary exciting cauſes. Such ſtatement is perfectly correct, notwithſtanding we have now to acquaint the reader, that in a few inſtances the rupture is already formed at the time of birth, and is ſtrictly congenital. This occurrence is explicable by the accidental circumſtance of the teſticle ſometimes contracting adheſions to ſome of the viſcera in its progreſs to the ring before birth. In this caſe the piece of inteſtine, omentum, &c. muſt follow the courſe of the teſticle into the ſcrotum, and if the deſcent of this gland is effected at the ordinary period, a ſtrictly congenital hernia muſt be formed. Some facts, corroborating this opinion, are related by Wriſberg. (Comment. Reg. Soc. Scient. Goetting. 1778, p. 43, 44-71.) Soemmerring has alſo ſeen the appendix vermiformis adhering to the teſticle. (Danz Zergliederungſkunde des ungebohrnen Kindes, vol. ii. p. 164.) The remarkable frequency of adheſions, between the teſticle and viſcera, in caſes of congenital hernia, muſt be well known to all experienced ſurgeons. It was noticed by Pott, and more recently by that incomparable writer Mr. Lawrence.

The anatomy of the congenital hernia reſembles that of the common bubonocele, where the protruſion happens at the inner opening of the ring, excepting that the viſcera lie in the tunica vaginalis, inſtead of an ordinary hernial ſac formed of the peritoneum.

The impoſſibility of feeling the teſticle at the lower part of the ſwelling diſtinguiſhes a congenital from a common ſcrotal hernia. The exiſtence of the diſeaſe from infancy is a ground for ſuſpecting its nature; but it is not a certain criterion, as very young children may have a bubonocele. See a caſe related by Mr. Lawrence, p. 59.

The treatment of the congenital hernia is to be regulated on the principles applicable to ruptures in general. When returnable, it ought, like every other kind of rupture, to be reduced, and conſtantly kept up by a proper truſs; and when attended with ſymptoms of ſtricture, it requires the ſame ſurgical aſſiſtance as the common hernia.

"In very young children," (ſays Mr. Pott,) "there are ſome circumſtances relative to this kind of rupture, which are very well worth attending to, as they may prove of very material conſequence to the patient.

"A piece of inteſtine or omentum may get pretty low down in the ſac, while the teſticle is ſtill in the groin, or even within the abdomen, both which I have ſeen. In this caſe, the application of a truſs would be highly improper; for in the latter, it might prevent the deſcent of the teſticle from the belly into the ſcrotum; in the former, it muſt neceſſarily bruiſe and injure it, give a great deal of unneceſſary pain, and can prove of no real uſe. Such bandage, therefore, ought never to be applied on a rupture in an infant, unleſs the teſticle can be fairly felt in the ſcrotum after the gut or caul is replaced; and when it can be ſo felt, a truſs can never be put on too ſoon.

"As this kind of rupture is ſubject to ſtricture, with all its conſequences, as much as that which is contained in a common hernial ſac, and therefore liable to ſtand in need of the chirurgic operation; it may be very well worth an operator's while to know that an old rupture, which was originally congenital, is ſubject to a ſtricture made by the ſac itſelf, independent of the abdominal tendon, as well as to that made by the ſaid tendon.

"Whether this be owing to the weight of the teſticle at the bottom of the ſac, and the endeavours which nature

makes

makes to close the upper part of the tunica vaginalis, or to what other cause, I will not pretend to say, but the fact I have several times noticed, both in the dead and in the living. I have seen such stricture made by the sac of one of these herniæ, as produced all those bad symptoms which render the operation necessary: and I have met with two different strictures, at near an inch distance from each other, in the body of a dead boy, about fourteen, one of which begirt the intestine so tight, that I could not disengage it without dividing the sac.

"In this kind of hernia I have also more frequently found connections and adhesions of the parts to each other, than in the common one; but there is one kind of connection sometimes met with in the congenital hernia, which can never be found in that which is a common hernial sac, and which may require all the dexterity of an operator to set free; I mean that of the intestine with the testicle, from which I have more than once experienced a good deal of trouble.

"When a common hernial sac has been laid open, and the intestine and omentum have been replaced, there can be nothing left in it which can require particular regard from the surgeon; but by the division of the sac of a congenital hernia, the testicle is laid bare, and after the parts composing the hernia have been reduced, will require great regard and tenderness, in all the future dressings, as it is a part very irritable, and very susceptible of pain, inflammation, &c.

"If a large quantity of fluid should be collected in the sac of a congenital hernia, and by adhesions and connections of the parts within, the entrance into it from the abdomen should be totally closed (a case which I have twice seen) the tightness of the tumour, the difficulty of distinguishing the testicle, and the fluctuation of the fluid, may occasion it to be mistaken for a common hydrocele; and if, without attending to other circumstances, but trusting merely to the feel and look of the scrotum, a puncture be hastily made, it may create a great deal of trouble, and possibly do fatal mischief.

"By what has fallen within my observation, I am inclined to believe that the sac of a congenital hernia is very seldom, if ever, distended to the degree which a common hernial sac often is: it also, from being less dilated, and rather more confined by the upper part of the spermatic process, generally preserves a pyriform kind of figure, and, for the same reason, is also generally thinner, and will therefore require more attention and dexterity in an operator when he is to open it. To which I believe I may add, that common ruptures, or those in a common sac, are generally gradually formed, that is, they are first inguinal, and by degrees become scrotal; but the congenital are seldom, if ever, remembered by the patient to have been in the groin only." Pott's Chirurgical Works, vol. 2.

A considerable tendency to contract always prevails in the membranous canal, by which the tunica vaginalis communicates with the abdomen. Hence, in young subjects, if the viscera be replaced, and maintained in their natural situation by means of a proper truss, a radical cure of the complaint is likely to be effected. But this beneficial change can scarcely be expected, when the disease has existed many years, and the employment of a truss can then only be regarded as a palliative.

The operation for the congenital hernia bears a close resemblance to that for the bubonocele, the chief difference being, that the operator has to cut into the tunica vaginalis, instead of a common hernial sac. Unless adhesions are present, there is no need to lay open the whole cavity of this membrane, and uncover the testicle completely, since a division of its upper part will suffice. It has been observed, by all the best writers on the subject, that in these cases, the stricture is particularly often produced by a contraction of the neck of the sac. In some instances, the contraction has been noticed lower down. It should be remembered, however, that the strangulation may likewise be produced either by the inner or outer opening of the ring. The stricture is to be divided, either directly upwards, or upwards and outwards, just as is done with respect to the bubonocele.

Uncommon Congenital Hernia.—Thus we find, that the ordinary congenital hernia differs from other species of rupture, by the protruded viscera lying in the cavity of the tunica vaginalis, uncovered by any other production of peritoneum. But it is our duty to relate, that a particular case is sometimes met with, where the bowels, besides being contained in the tunica vaginalis, have likewise a peritoneal covering, or true hernial sac. The first example of this disease was published by Mr. Hey, and Mr. Astley Cooper has subsequently recorded another. In the kind of rupture at present engaging our attention, the viscera are protruded, after the communication between the abdomen and tunica vaginalis is closed; and, therefore, the peritoneum is carried down along with the viscera, and forms the hernial sac. It is evident, also, that the hernia must be produced while the original tunica vaginalis remains in the form of a bag as high as the abdominal ring, so as to be capable of receiving the hernial sac and its contents, and permit the sac to come into contact with the testicle. In the case described by Mr. Hey, the proper hernial sac, in consequence of its remaining constantly in a preternatural state, had every where contracted an adhesion to the original process of the peritoneum, which surrounded it, except at its inferior extremity. There the external surface of the hernial sac was smooth and shining, as the interior surface of the tunica vaginalis is in its natural state. The rupture was first noticed by the mother, when the child was about two months old. Mr. Hey apprehends, that as male children are often attacked with a scrotal hernia, in the first or second month after birth; it is probable that the disease may often be of this species when it comes on at so early a period of life. He thinks, therefore, that this sort of rupture might not improperly be called *hernia infantilis*, as it can only be formed while the parts retain the state peculiar to early infancy.

An operator, ignorant of the nature of this kind of rupture, might be greatly perplexed, on opening the tunica vaginalis, to find another hernial sac within it, which would stand in need of being divided.

Analogous Hernia to the Inguinal Congenital in Females.—Small productions of the peritoneum have been observed in women, extending through the abdominal ring over the round ligament of the uterus, and terminating by a blind extremity at the groin. Such processes of the peritoneum may be compared with the tunica vaginalis of the male. They have been termed *diverticula*. It has not been ascertained whether the upper part of these diverticula become closed, like the communication between the abdomen and tunica vaginalis. They have been observed by Nuck, Camper, Le Cat, and Wrisberg, and a reference to the works, in which mention is made of them, may be found in Mr. Lawrence's Treatise on Ruptures. The existence of such diverticula may favour, in a certain degree, the occurrence of a rupture, which, were it to happen, would bear an analogy to the inguinal congenital hernia of the male subject.

Umbilical Hernia, also named Exomphalos, Omphalocele, &c.—This hernia, which is less common than the inguinal and femoral ruptures, afflicts very young infants, and likewise

wife women whofe abdominal parietes have often been diftended by pregnancy; but it is feldom met with in male adults, or old perfons. In grown-up females, it was thought by Petit, that the parts are moft frequently protruded at one fide of the umbilicus. (Traité des Mal. Chirurg. tom. ii. p. 250.) But Mr. Aftley Cooper is of opinion, that the protrufion ufually happens through that opening itfelf. (On Crural and Umbilical Hernia, p. 35.) In a late excellent work on furgery, it is remarked, that the umbilicus is a kind of cicatrix, formed, in confequence of the feparation of the funis, by the contraction of the parts with which it was continuous, and that it only gradually acquires the degree of firmnefs which it has in the adult fubject. As it is for a long while weaker than the reft of the abdominal parietes, it only makes an inferior degree of refiftance to the vifcera; but this refiftance increafes with age; and, as the cicatrix now becomes ftronger than the furrounding parts, it forms a more impenetrable barrier againft any efcape of the bowels. From thefe anatomical facts, the following pathological inferences, which are confirmed by experience, are deducible. Firft; that infancy is more fubject than any other age to the umbilical hernia, ftrictly fo called, in which the parts are protruded through the navel. Secondly; that other periods of life are more fubject than infancy to falfe umbilical herniæ, or to thofe which arife in the vicinity of the umbilicus. Œuvres Chirurgicales de Defaalt par Bichat, tom. ii. p. 315.

The obfervations, which Mr. Pott has left us on the exomphalos, are, as far as they go, exceedingly accurate. He takes notice, that this fpecies of hernia, like others, "has for its general contents, a portion of inteftine, or omentum, or both. In old umbilical ruptures, the quantity of omentum is fometimes very great.

"Mr. Ranby fays, that he found two ells and a half of inteftine in one of thefe, with about a third part of the ftomach, all adhering together.

"Mr. Gay and Mr. Nourfe found the liver in the fac of an umbilical hernia; and Bohnius fays that he did alfo.

"But whatever are the contents, they are originally contained in the fac, formed by the protrufion of the peritoneum.

"In recent and fmall ruptures, this fac is very vifible; but in old, and large ones, it is broken through at the knot of the navel, by the preffure and weight of the contents, and is not always to be diftinguifhed; which is the reafon why it has by fome been doubted whether this kind of rupture has a hernial fac or not.

"Infants are very fubject to this difeafe, in a fmall degree, from the feparation of the funiculus; but in general they either get rid of it as they gather ftrength, or are eafily cured by wearing a proper bandage. It is of ftill more confequence to get this diforder cured in females, even than in males, that its return, when they are become adult, and pregnant, may be prevented as much as poffible; for at this time it often happens, from the too great diftention of the belly, or from unguarded motion when the parts are upon the ftretch. During geftation, it is often very troublefome, but after delivery, if the contents have contracted no adhefion, they will often return, and may be kept in their place by a proper bandage.

"If fuch bandage was always put on in time, and worn conftantly, the difeafe might in general be kept within moderate bounds, and fome of the very terrible confequences which often attend it might be prevented. The woman who has the fmalleft degree of it, and who from her age and fituation has reafon to expect children after its appearance, fhould be particularly careful to keep it reftrained.

"In fome the entrance of the fac is large, and the parts eafily reducible; in others they are difficult, and in fome abfolutely irreducible. Of the laft kind many have been fufpended for years in a proper bag, and have given little or no trouble. They who are afflicted with this diforder, who are advanced in life, and in whom it is large, are generally fubject to colics, diarrhœas, and, if the inteftinal canal be at all obftructed, to very troublefome vomitings. (Hence patients are often fuppofed to labour under a ftricture, when they really do not.) It therefore behoves fuch to take great care to keep that tube as clean and free as poffible, and neither to eat or drink any thing likely to make any difturbance in that part." See Pott's Chirurgical Works, vol. ii.

An umbilical hernia, at its commencement, is of a roundifh conical form; but when it is large, and has exifted a confiderable time, the portion, which is moft diftant from the navel, becomes broader and more expanded, fo that the tumour has the appearance of hanging by a kind of pedicle. The protruded parts naturally tend downwards, the opening into the abdomen being at the upper part of the fwelling, and not at its middle. When the tumour is neglected, it attains an enormous fize, defcending to the os pubis, and even over the pudenda, incapacitating the patient for active exertion, and forming a conftant fource of inteftinal complaints. When the patient is fat, the rupture may extend between the integuments and mufcles, without caufing any external fwelling. Lawrence on Ruptures, p. 389.

It has been aflerted by many eminent furgeons, that the exomphalos is deftitute of a hernial fac. Dionis, De la Faye, Garengeot, and J. L. Petit, maintain fuch an opinion. The truth is, that the umbilical hernia, like moft other ruptures, always has originally a hernial fac, which, however, is often exceedingly thin, and intimately adherent to the mufcles. We have feen, that Pott had more accurate information, and that he fubfcribed to the fentiment, which is now univerfally adopted, that the exomphalos invariably has at firft a peritoneal inveftment. There are feveral circumftances, which contributed to the miftake, that the umbilical hernia had no hernial fac. Firft, it is not unufual to fuppofe, that the umbilical veffels perforate the peritoneum, which is thereby rendered imperfect juft behind the navel. This notion admits of being eafily refuted, by a reference to more correct anatomy. Secondly, it is actually a fact, that, in particular examples, the fac is in fome places abforbed, or lacerated, fo as to allow of a protrufion of its contents, and threaten, from this caufe, a double ftricture. Two fuch examples have been feen by Mr. Aftley Cooper; but they are the only cafes where he ever faw the fac at all deficient. Even where the fac is wanting at a part of the fwelling, in confequence of the abforption occafioned by the preffure of the vifcera, the deficiency only exifts at a diftance from the navel, in the vicinity of which opening, veftiges of the exiftence of a hernial fac may in general be plainly traced.

Although the advice, delivered to us by many writers, to proceed with great caution in the divifion of the containing parts of an umbilical hernia, is generally founded on the erroneous opinion of there being no hernial fac, yet, fince the coverings of this rupture are frequently very thin, the counfel is not to be difregarded. Indeed, in fome inftances, the integuments and hernial fac are infeparably confounded together on the forepart of the fwelling. The vifcera have likewife been repeatedly feen adhering to the integuments, where a part of the hernial fac had been deftroyed by abforption. See Arnaud on Hernia, p. 323. Mem. de l'Acad. de Chir. tom. ii. p. 590. Monro on Crural Her-

nia,

ata, p. 24. Cooper on Crural and Umbilical Hernia, p. 37.

When the contents of an exomphalos are free from adhefions, they may in general be eafily reduced, on the patient being placed in a recumbent poſture, and proper preſſure made on the tumour. The protruſion is then to be prevented from taking place again by the inceſſant employment of a ſuitable truſs. The truſſes for the exomphalos will be deſcribed in a future volume of this work. (See Truss.) Patients, afflicted with umbilical ruptures, are obſerved to be more troubled with occaſional vomiting, flatulence, and colic complaints, than happens with regard to perſons labouring under other kinds of hernia. For this reaſon, too much care cannot be taken to eat ſuch food as is light and eaſy of digeſtion.

An irreducible exomphalos of moderate ſize may ſometimes be prevented from becoming larger, by the uſe of a truſs with a hollow pad; but when the ſwelling is large, its increaſe can only be reſtrained by ſuſpending it in bandages, paſſed under it and over the ſhoulders.

The opening, through which the protruded bowels paſs, being generally capacious, the exomphalos is ſeldom ſtrangulated, though ſymptoms, bearing a near reſemblance to thoſe of an incarcerated hernia, are not unfrequent. As we have already ſtated, the patient is apt to be afflicted with violent colic complaints, which can only be diſtinguiſhed from the conſequences of ſtrangulation by the attentive and judicious ſurgeon. Such diſcrimination, however, is of the higheſt importance to the patient, ſince the performance of an operation unneceſſarily would be likely to aggravate the diſorder ſo ſeriouſly as to prove fatal. We earneſtly enjoin, therefore, the admirers of operative ſurgery not to be in too great a hurry with their ſcalpels; but, on the contrary, to be fully impreſſed with the facts, that an exomphalos is not often ſtrangulated, and that operations done on this ſpecies of rupture have been attended with notorious ill ſucceſs. Hence, before having recourſe to the knife, let the ſurgeon perſiſt a prudent time in trying well the effect of mild, aperient, and laxative glyſters. In ſome caſes, the ſudden enlargement of the ſwelling, and the painful inflamed ſtate of the hernia, will clearly indicate that the diſeaſe is ſtrangulated. Hence the ſame methods ſhould be tried, which have been recommended for incarcerated herniæ in general, before the operation. When the operation is to be done, the tumour is to be opened with much circumſpection, and the ſtricture divided with a probe-pointed biſtoury directly upwards, in the courſe of the linea alba. Some ſurgeons content themſelves with making one longitudinal inciſion through the integuments; others practiſe two, which together reſemble the letter T inverted. We perfectly coincide with Mr. Aſtley Cooper and Mr. Lawrence on the propriety of avoiding to lay open a large umbilical hernia. When the rupture at all exceeds a moderate ſize, this gentleman recommends either dividing the ſtricture, without opening the ſac, or only cutting the latter part ſufficiently to allow the ſtricture to be dilated. This will permit the return of the parts, if they are not adherent, and, if adheſions ſhould have formed, the immediate cauſe of danger, the ſtrangulation, is removed. Two caſes, operated upon in this manner by Mr. Aſtley Cooper, are ſtrongly in favour of the plan. On Crural and Umbilical Hernia, p. 51—55.

Of the Umbilical Hernia in Children.—Young infants are often afflicted with umbilical ruptures, the protruſion taking place before the cicatrix of the navel has acquired ſufficient firmneſs. It was aſcertained by Default that ſuch hernia are moſt liable to happen in the ſecond, third, and fourth months after birth. The bowels, being then puſhed againſt the aperture dilate it, and, carrying before them a proceſs of the peritoneum, produce a ſmall tumour, which by degrees becomes larger, and poſſeſſes the ordinary characters of a rupture. The protruded parts generally prevent the umbilicus from contracting and cloſing, although, in conſequence of the ſtrong tendency of this aperture to become obliterated, the proceſs of contraction occaſionally overcomes the reſiſtance of the prolapſed viſcera, and a ſpontaneous cure of the hernia is the reſult. Two caſes, proving this fact, are recorded in Œuvres Chirurgicales de Default par Bichat, tom. ii. p. 318. It is not to be ſuppoſed, however, that this is the common courſe of things. In almoſt all caſes, unaſſiſted nature is incapable of accompliſhing a cure; the tumour grows larger and larger, and the opening, as the child increaſes in years, loſes all diſpoſition to contract.

In very young children a radical cure of the umbilical hernia may be eaſily effected, while in adults this deſirable object is nearly impoſſible. In infants, indeed, a cure may be brought about by merely preventing the viſcera, for a time, from being protruded, and from reſiſting the natural tendency of the opening to become ſhut up.

Compreſſion and the ligature are the only two effectual and rational methods of curing the umbilical herniæ of young ſubjects. The laſt of theſe plans is the moſt ancient, having been firſt practiſed by the Greeks, and afterwards by the immortal Celſus. Mr. Pott has ſtrongly expreſſed his diſapprobation of the ligature, as a means of curing the exomphalos. But we ſhall find, in the writings of Default, many weighty facts and obſervations in its favour. Every one, however, muſt allow that the practice is unjuſtifiable on adults, who muſt be content with the compreſſion of a truſs. Compreſſion was what Pott recommended even for young ſubjects, in whom a cure may, in this way, be often accompliſhed when the tumour is ſmall, and the bandage is worn a ſufficient length of time. Should this mode of treatment be preferred, the ſurgeon, after reducing the viſcera, is to apply to the opening a piece of cork or ivory, or any other convex ſolid body adapted to the aperture. The ſubſtance employed is then to be maintained in its place by a round bit of adheſive plaſter, and a belt or bandage round the trunk. The belt ought to be broader in front, and quilted, in order that it may not wrinkle nor ſlip about. It is always to be well remembered, that, if a radical cure be aimed at, it is eſſential that an occaſional protruſion of the viſcera be never ſuffered; and therefore, whenever the bandage is ſhifted, the parts muſt be carefully kept up at the time with the finger. We ſhall not enter into the ſeveral objections urged by Default againſt the treatment by compreſſion. Such practitioners as wiſh to conſider them will find them detailed by Bichat, and they are undoubtedly not of a trivial nature. On one ſide, we ſhall find that the beneficial effects of compreſſion have alone been taken into the ſcale, while its failures and inconveniencies have been totally loſt ſight of. If we look the other way, it will quickly be diſcovered that the ligature, which is employed at the Hôtel-Dieu, preſents an uninterrupted ſeries of well authenticated cures, which, in Default's practice, amounted to the number of fifty. In the latter years of his practice, you might ſee many perſons bringing to his public conſultations their children, which were immediately operated on without any preparation, carried home immediately afterwards, and brought the next, and every following day, to be dreſſed, till the cure was complete.

To theſe conſiderations are to be added other motives, which are perhaps not immaterial. The children of the poor may be cured in an hoſpital, by the ligature, in the ſpace of a few days; but when compreſſion is adopted, the

parents

parents are frequently put to repeated expence, as the bandage wears out, and to additional loſs from the time conſumed in paying the neceſſary attentions.

The ancients had different modes of applying the ligature, but what they have tranſmitted to us may be referred to two different proceſſes. One conſiſted in reducing the parts, and afterwards tying the integuments and ſac, without opening the latter at all. In the other, an inciſion was made in the ſac, either before or after tying it, for the purpoſe of being ſure that no piece of inteſtine was, or could become ſtrangulated in the ligature. Celſus adopted the firſt plan. Paulus Ægineta preferred the ſecond, and was imitated by all the Arabian phyſicians, and their ſucceſſors. Avicenna, Albucaſis, and Guy de Chauliac, give us proofs of this in their ſeveral works.

Experience ſoon decides which of theſe modes of operating ought to be choſen. One is leſs painful, and equally ſafe; for one ſoon becomes habituated to aſcertaining whether there is ſtill any inteſtine in the ſac by rubbing the oppoſite ſides of this bag againſt each other. The other, which is unneceſſarily cruel, increaſes the pain, without making the method at all more certainly ſucceſsful. The latter has been uſually adopted, and Paré, who has deſcribed it, does not even mention the former. Latterly, ſome variations in the plan of operating were made. Some ſimply tied the baſe of the tumour; others paſſed through it one or two needles, armed with ligatures, for the purpoſe of fixing ſuch ligatures in a better manner, and even making, for this purpoſe, a circular inciſion for the lodgment of them. It is chiefly in the Arabian practice that we meet with this cruel proceeding, which was alſo uſeleſs, as the ligature was never known to fail when properly applied. Paré alſo deſcribes it; but Saviard, the only modern who has practiſed the ligature, rejected it, and followed the plan long ago adviſed by Celſus. Sabatier ſeems to recommend, in his work on the operations, both plans indifferently, with the exception of the circular inciſion. Default's method, which much reſembles that of Saviard, is ſimple, and attended with little pain. In ſhort, it is the following:

The child, on whom the operation is to be done, muſt be placed on its back, with its thighs a little bent, and its head inclined towards the cheſt. The ſurgeon is to reduce the protruded parts forming the tumour, and to hold them ſo with his finger at the ſame time that he raiſes the hernial ſac, and rubs its ſides between his fingers, ſo as to be ſure that there is nothing contained in it. Being certain that the parts which he lifts up are only the ſkin and ſac, he is to direct an aſſiſtant to ſurround their baſe ſeveral times with a waxed ligature of middling ſize, each turn being tied with a double knot, in ſuch a manner as only to occaſion little pain. The tumour, thus tied, is to be covered with lint, which is to be ſupported with one or two compreſſes, and a circular bandage, ſecured with a ſcapulary. A ſlight ſwelling commonly takes place in the conſtricted parts by the following day, juſt as a polypus ſwells after its baſe has been tied.

No pain accompanies this tumefaction, which is itſelf often ſcarcely perceptible, as may be ſeen by referring to the firſt caſe of this operation, related in the Pariſian Journal. On the ſecond or third day the parts ſhrink, and then the ligature becomes looſe, ſo that a freſh one muſt now be applied in the ſame manner as the firſt, taking care to draw it a little more tightly. The ſenſibility of the parts, increaſed by the inflammation which the conſtriction of the ligature has already produced, uſually renders this ſecond ligature more painful. After the operation the ſame dreſſings as before are to be applied. The tumour ſoon becomes diſcoloured, livid, and ſmaller. A third ligature, put on in the ſame way as the preceding ones, entirely obſtructs the circulation in it. The part turns black and flaccid, and commonly falls off on the eighth or tenth day. A ſmall ulcer is left, which, being properly dreſſed, very ſoon heals, and leaves a cicatrix ſufficiently ſtrong to reſiſt the impulſe occaſioned by coughing, or other efforts of the abdominal muſcles. For two or three months, however, after the operation, the child ſhould wear a circular bandage, in order to prevent, with ſtill more certainty, the viſcera from being propelled againſt the cicatrix, ſo as to interrupt the proceſs of nature, which is now producing a gradual cloſure of the umbilical opening. Numerous caſes might here be adduced in confirmation of the above practice; but ſeveral (nine) are already publiſhed in the Pariſian Surgical Journal. The relation of others here would only prolong our obſervations in a fruitleſs manner. Suffice it to remark, that ſince thoſe alluded to were publiſhed, Default has practiſed an infinite number of operations of this ſort with equal ſucceſs; that, every week, many children were brought by their mothers into the amphitheatre, where he publicly delivered his lectures; that here the ligature was applied in the preſence of all his pupils; and that children, thus operated upon, were carried home, and brought back every day to be dreſſed till the cure was completed.

But one may doubt (ſays Sabatier) quoting the article in the journal, where Default treats of the preſent diſeaſe, whether the infants got rid of the hernia, as it might have returned ſome time afterwards. Numerous facts remove this doubt; for ſeveral of the ſubjects were brought to Default's public conſultation for other diſeaſes a long while after they had been operated upon, and the great number of ſtudents, who examined them, all acknowledgedthat the ring was completely obliterated, and there was no impulſe of the viſcera in coughing, ſneezing, &c. Other children, in the knowledge of the ſurgeons of the Hôtel-Dieu, have remained perfectly cured of their umbilical herniæ, by the operation which Default has revived. Bichat is acquainted with two young ſubjects, who were operated on four years ago, and have ſince had no relapſe

The operation is almoſt certainly ſucceſsful in young infants; but it becomes leſs ſo in proportion as their age increaſes. Bichat relates three caſes, which tend to ſhew that ſucceſs may be completely obtained at the age of a year and a half; that the cure is difficult when the child is four years old, and impoſſible when it is nine. Several other operations, done too late, have had the ſame reſult. See Œuvres Chirurgicales de Default par Bichat, Mémoire ſur la Herniæ Ombilicale des Enfans, tom. 2.

Of the Congenital Umbilical Hernia.—Under this head authors comprehend caſes in which the funis umbilicalis ends in a bag, containing ſome of the abdominal viſcera and communicating with the cavity of the belly by an opening at the navel. The term *congenital* is here employed with ſtrict propriety, as the diſeaſe actually exiſts at the time of birth; but, as Mr. Lawrence obſerves, this form of the complaint ought not, ſtrictly ſpeaking, to be called a rupture, as it happens from an original deficiency in the formation of the part, the ſituation of the fœtus in the uterus, and the abſence of reſpiration making the ſuppoſition, that a hernia could happen before birth, altogether abſurd. The diſtention of the funis ſometimes renders its external coat ſo tranſparent that the folds of the ſmall inteſtines can be clearly diſcerned through it.

In one example, where the tumour was of the bulk of a hen's egg, Mr. Hey reduced the inteſtine, and deſired an aſſiſtant to hold the funis compreſſed ſo near to the abdomen that

that the bowel could not ſlip into the hernial ſac. He procured ſome plaiſter ſpread upon leather, which was cut into circular pieces, and theſe were laid upon one another in a conical form. This compreſs was put over the navel, after the ſkin on each ſide of the aperture had been brought into contact, and one lip placed a little over the other. He then put round the child's abdomen a linen belt, and laid upon the navel a thick, circular, quilted part.

This bandage kept the inteſtine ſecurely within the abdomen, and was occaſionally renewed. The funis was detached about a week after birth, and, at the expiration of a fortnight from that time, the aperture at the navel was ſo far contracted, that the crying of the child, when the bandage was removed, did not cauſe the leaſt protruſion. The uſe of the bandage, however, was continued a little longer.

When the quantity of protruded bowels is very great, not much hope of a cure can be indulged; but, in every inſtance, it is the duty of the ſurgeon to reduce the parts, and do his utmoſt for the infant's preſervation. Mr. Hey relates two caſes, in which he found enormous portions of the inteſtinal canal thus protruded. Although he ſucceeded in reducing the viſcera, the children did not ſurvive the complaint.

In the ſecond part of Mr. Aſtley Cooper's valuable work on hernia, we are informed that Dr. Hamilton has uſually met with about two caſes of the hernia congenita umbilicalis annually, during the ſpace of ſeventeen years. This laſt gentleman, after reducing the contents of the ſwelling, and applying a tight ligature round its baſe, brought the edges of the parietes of the abdomen together, by means of two ſilver pins, and ſtrips of ſticking-plaſter. In this way, a complete cure was accompliſhed in a few days.

As we have never had an opportunity of ſeeing this diſeaſe treated, we cannot offer any decided opinion upon the comparative merit of the two plans above deſcribed. But we are inclined to think moſt favourably of Mr. Hey's, as being moſt ſimple, and attended with no pain.

Ventral Herniæ.—The term *ventral* is extended to all ſuch ruptures as happen at any other parts of the abdomen beſides the abdominal ring, under the crural arch, and at the navel. Their moſt frequent ſituation is in the courſe of the linea alba, ſomewhere between the enſiform cartilage and the ſymphyſis of the os pubis. They more commonly occur below than above the umbilicus, in conſequence of the interſpace of the recti muſcles being more conſiderable below this cicatrix. The weight of the abdominal viſcera operates chiefly at the lower part, in which ſituation, alſo, the aponeuroſis of the recti muſcles is ſaid to be weakeſt, and moſt apt to give way. But, ventral ruptures are not confined to the linea alba; ſometimes they happen in the linea ſemi-lunaris, or between the falſe ribs and the os ilium.

When the hernia happens in the linea alba, a ſoft and compreſſible tumour makes its appearance at the middle of the forepart of the belly. Its ſhape is in general oblong; its ſize various. When the diſeaſe acquires an exceedingly large ſize, it might receive the appellation, ſo much uſed by the French, of "eventration," though this term is perhaps more properly reſerved for herniæ which depend upon a relaxation of a large portion of the anterior parietes of the abdomen, caſes where the greater part of the viſcera are protruded.

In certain inſtances, theſe eventrations are the conſequence of repeated pregnancies. In this way, the forepart of the abdomen has been obſerved to be ſo completely weakened (the effect of reiterated diſtention), as to form a bag, which deſcended over the thighs, and contained not only the omentum and maſs of inteſtines, but even the gravid uterus itſelf.

It is obvious, that the radical cure of this ſort of rupture muſt be difficult, ſince it is almoſt impoſſible to reſtore to the abdominal parietes the tone which they have loſt. The treatment is reſtricted to adviſing the patient to wear broad, elaſtic belts, or a wide ſuſpenſory, in the event of the ſwelling hanging down over the thighs. When a common ventral rupture happens in the linea alba, it ſhould be reduced, and then kept up with the ſame ſort of truſs as is employed for the exomphalos. See Truss.

Eventrations can hardly become ſtrangulated, though bad and fatal ſymptoms may be occaſioned by an accumulation of inteſtinal matter, and by obſtruction in ſome part of the protruded viſcera. This ſtate has been called by the French "engouement." See Richeraud's Noſographie Chirurg. tom. iii. p. 405.

The occurrence of what is ordinarily underſtood by ventral ruptures, has been referred to apertures exiſting in the parietes of the abdomen for the tranſmiſſion of blood-veſſels and nerves. Mr. Lawrence, however, has regarded this explanation as, at beſt, but very doubtful. He notices, that ventral herniæ ſometimes take place ſuddenly, from a conſiderable bodily exertion, and with a ſenſe of laceration. He conceives, that in making efforts, ſome part may often be actually torn, ſo as to give riſe to the rupture.

Penetrating wounds of the abdomen are ſtated to be generally followed by herniæ. A caſe of this kind was obſerved by Mr. Wardrop. (See Cooper, part 2. p. 60.) Ventral ruptures are likewiſe ſaid to be ſometimes a conſequence of abſceſſes of the belly, blows on this part, &c.

The ventral herniæ, occaſionally obſerved near the ſcrobiculus cordis, have been called by the French herniæ of the ſtomach, from an opinion that a portion of this organ was contained in them. They are uſually attended with ſtomachic complaints; but Mr. Lawrence believes that the ſtomach has never been ſeen in ſuch a rupture.

Ventral ruptures are to be treated on the principles applicable to herniæ in general. They ſhould always be reduced, if poſſible, and kept up with a truſs. They are ſeldom ſtrangulated, though ſometimes attended with nauſea, indigeſtion, &c. Should they become incarcerated, the treatment ought to be like what has been adviſed for other ruptures, and, when reduction cannot be accompliſhed without an operation, this muſt be performed much in the ſame manner as is done in caſes of exomphalos. Suppoſing the hernia to be ſituated in the courſe of the linea alba, the ſtricture may be divided directly upwards.

Hernia of the Bladder, or Cyſtocele.—A hernia of this kind differs materially from ordinary caſes, ſince there is no hernial ſac, and the diſeaſe rather conſiſts of an elongation, than a diſplacement of the bladder. The impoſſibility of a complete diſplacement muſt, indeed, be immediately obvious, on reflecting how firmly this organ is fixed to the perineum and os pubis.

When, in a perſon ſubject to retentions of urine, the bladder is much dilated, riſing above the pubes, it acquires a ſituation behind the abdominal ring, without any interpoſition of the peritoneum. In this ſtate, the leaſt effort may bring on an elongation of the diſtended bladder through that opening. Thus, a kind of appendage to this organ is formed, which may reach more or leſs downwards. In moſt inſtances it deſcends no lower than the groin; occaſionally it paſſes into the ſcrotum. When a conſiderable por-

tion of the urinary bladder is protruded, its fundus and poſterior ſurface are dragged towards the ring, and even paſs through this aperture, together with the peritoneum, which covers them.

The portion of this membrane, which is thus drawn out by the protruded part of the bladder, and follows it, compoſes a pouch, into which the omentum and bowels eſcape, ſo that a cyſtocele is very commonly complicated with an ordinary inguinal hernia.

A hernia of the bladder is characterized by a ſoft, oblong, fluctuating tumour, ſituated in the bend of the groin; it makes its firſt appearance near the abdominal ring, and gradually increaſes in ſize by deſcending more and more towards the ſcrotum. The ſwelling is made to diſappear by compreſſion; it becomes larger when the patient holds his water; but diminiſhes and entirely ſubſides when he makes ſuch evacuation. The laſt circumſtance unequivocally diſtinguiſhes the diſeaſe from the encyſted hydrocele of the ſpermatic cord, while the feel of fluctuation exhibits its difference from an enterocele. It is alſo to be remembered that cyſtocele ſeldom afflicts perſons unleſs they have been often troubled with retentions of urine. The patient in general makes water more frequently than natural.

Beſides this ſort of hernia of the bladder, there are caſes on record, where portions of this viſcus have been protruded under the crural arch, and in the perineum and vagina.

Were a ſurgeon called to a cyſtocele in a very recent ſtate, he ſhould endeavour to reduce the protruded part, and keep it up with a truſs. In almoſt all caſes, however, the caſe is irreducible, in conſequence of the prolapſed part being firmly adherent in its unnatural poſition. The fluid which it contains can alone be made to return. In this circumſtance Richeraud and other writers ſpeak of deſtroying all communication between the cavity of the pouch and that of the reſt of the bladder by compreſſion. But the propriety and advantage of this project ſeem very queſtionable, and it appears to us, that all that can be rationally done is to adviſe the patient to wear a ſuſpenſory bandage, which will ſerve to reſtrain the increaſe of the ſwelling.

A cyſtocele cannot be attended with ſtrangulation, except when complicated with an inteſtinal or omental hernia. In ſuch a caſe, great care ſhould be taken to avoid making an opening unneceſſarily into the bladder.

The hernia of the bladder is exceedingly uncommon under the crural arch. Verdier has recorded an inſtance in the Mém. de l'Acad. de Chirurgie, tom. ii. p. 23.

Calculi have often been obſerved in the protruded portion of the bladder. They may be ſafely extracted through an inciſion made for the purpoſe. Acad. de Chirurg. tom. ii. p. 11—13.

It is aſſerted that protruſions of the bladder may happen between the fibres of the elevatores ani, when torn by a violent abduction of the lower extremities. The caſe could only be treated by compreſſion.

Perineal Hernia.—The records of ſurgery furniſh us with examples of herniæ, which have occurred at the lower aperture of the pelvis. In men, the viſcera are protruded between the bladder and rectum; in women, between the rectum and vagina. As the part, where the peritoneum is reflected from the rectum to the vagina, or bladder, is at a conſiderable diſtance from the peritoneum, it is not difficult to comprehend, that a protruſion may exiſt, without forming any external ſwelling. When this is the caſe, the hernia can only be diſtinguiſhed in men by examining within the rectum; in women, the diſeaſe may be detected both in this way, and by feeling within the vagina.

The contents of perineal herniæ have been inteſtine, or a part of the urinary bladder. The ſwelling becomes larger and more tenſe in the erect poſition, or when the patient holds his breath; ſmaller or ſofter when he lies down, and diſappears entirely on preſſure. It produces various inteſtinal complaints. In men, it muſt conſtantly irritate and preſs upon the bladder. When this laſt viſcus is protruded, the ſymptoms peculiar to cyſtocele will prevail.

The reduction of the perineal hernia is beſt accompliſhed with the aid of a finger introduced into the rectum or vagina. The parts are to be prevented from deſcending again by means of the T bandage, which is to be applied over a ſuitable compreſs of ivory, or ſofter materials, placed on the perineum. In females, a protruſion may be hindered by diſtending the vagina with a peſſary.

Were a ſurgeon called to a ſtrangulated perineal hernia, and the urgent ſymptoms reſiſted the uſual methods, it would be his duty to endeavour to afford relief by an operation. Both this kind of rupture and that of the vagina may prove a ſource of great danger in caſes of parturition, as we may convince ourſelves of, by referring to ſome facts related in Smellie's Midwifery.

An inſtance of perineal hernia is deſcribed by Mr. Aſtley Cooper, in his inſtructive work upon the ſubject before us. See part ii. p. 67. And plate II. fig. 3.

Caſes which were probably protruſions of a part of the bladder towards the perineum, are recorded by Mery, Verdier, and Pipelet, in the Memoirs of the Academy of Sciences for 1713, and thoſe of the Royal Academy of Surgery in France.

Hernia of the Vagina.—The ſituation in which the protruſion begins is the ſame as in the perineal rupture; but in the latter caſe, the vagina reſiſts, and does not give way. In the rupture now under conſideration, the ſwelling projects into the vagina, and is covered by the membrane of that canal. Women who have borne children are more ſubject to this diſeaſe than other females. The tumour is moſtly formed by the ſmall inteſtines. When the protruſion is occaſioned by the bladder, the ſwelling is ſituated on the anterior and upper ſurface of the vagina. This ſpecies of hernia is generally brought on by a violent exertion. Its contents may be readily puſhed up by the hand, but they deſcend again if the patient coughs or ſtrains. All active and laborious purſuits are productive of a painful ſenſe of bearing down. The diſeaſe is frequently accompanied with diſorders of the alimentary canal. Very often the bladder is affected, in conſequence of the vicinity of the tumour. When this receptacle itſelf forms the protruſion, preſſure on the ſwelling will cauſe a diſcharge of urine from the meatus urinarius.

In this diſeaſe the firſt indication is to reduce the parts by the preſſure of the hand, care being taken to effect a complete reduction, and not allow any portion of the protruded viſcera to continue in the long track, through which they may have deſcended. Therefore they muſt be preſſed up as far as the os uteri. They are to be prevented from deſcending again by the uſe of a peſſary, which muſt be ſhaped either like a globe, or hollow cylinder.

The vaginal hernia might be attended with much danger and inconvenience, were it to be down at the time of parturition. Hence, during the labour pains, it behoves the practitioner to maintain the viſcera reduced by preſſure, until the child's head has paſſed down into the pelvis. Should the head have deſcended, while the rupture is down, delivery ſhould be expedited as much as poſſible.

The following account of a vaginal cyſtocele, which is recorded

corded by Sandifort in his Obſ. Anat. Pathol. l. i. cap. 3, is extracted from Mr. Lawrence's treatiſe. "Retention of urine, and difficulty of introducing the catheter, followed a violent cough. A large tumour occupied the whole cavity of the vagina. Fluctuation could be felt in this, but no urine was evacuated on preſſure, unleſs the catheter was introduced at the ſame time; then a plentiful evacuation enſued, but the contents were not entirely diſcharged, unleſs the compreſſion was continued. When all the urine had been drawn off, the catheter could be eaſily introduced; the tumour diſappeared; the ſuperior part of the vagina felt lax and flaccid; and the finger could be puſhed up to the mouth of the uterus, till the ſwelling began again to increaſe by the urine collecting in the bladder. The uſe of a peſſary produced a perfect cure. Three other caſes of large ſwellings in the vagina, reduced by the employment of the catheter, and again increaſing, were communicated to Sandifort by a very ſkilful phyſician, who practiſed midwifery." P. 471, 472. edit. 2.

Pudendal Hernia.—This name has been applied by Mr. Aſtley Cooper to the caſe, where the viſcera are protruded between the vagina and ramus iſchii, forming an oblong tumour in the labium traceable within the pelvis, as far as the os uteri. The diſeaſe bears a conſiderable reſemblance to the vaginal hernia; the parts deſcend along the ſurface of the vagina; but inſtead of making a protruſion into that canal, they paſs between it and the levator ani, and form a ſwelling in the middle of the labium pudendi. Mr. Aſtley Cooper ſuſpects that this caſe has ſometimes been miſtaken for a hernia of the foramen ovale. Its ſituation alſo renders it liable to be thought a bubonocele, though the circumſtance of the upper part of the labium being free from the tumour is ſufficient to afford a plain mark of diſtinction.

When the pudendal hernia admits of reduction, a common female bandage, or the truſs, ſometimes employed for the prolapſus ani, ſhould be worn. A peſſary, unleſs immoderately large, could not very well keep the parts from deſcending, as the protruſion happens ſo far from the vagina. Mr. Aſtley Cooper believes, that when this hernia is ſtrangulated, it may, in general, in conſequence of the yielding nature of the parts, be reduced, by preſſing the protruded viſcera, with gentle and regular force, againſt the inſide of the ramus iſchii. Should this plan prove unavailing, the effect of the warm bath, bleeding, and tobacco clyſters ought to be tried. Were an operation neceſſary to ſave the patient's life, Mr. Aſtley Cooper adviſes the inciſion to be made in the labium. Then the lower part of the ſac is to be cautiouſly opened, and the ſtricture divided inwards, towards the vagina, with a concealed biſtoury, guided by a finger introduced into that canal. It will be right to deſire the patient to empty her bladder, either before trying to reduce the tumour, or undertaking the operation. A caſe of the pudendal hernia is recorded by the preceding gentleman. See his work on the Crural and Umbilical Hernia.

Thyroideal Hernia, or Hernia of the Foramen Ovale of the Pelvis.—It is well known to every body verſed in anatomical ſtudies, that the foramen ovale is ſhut up by a ligament, in which, however, an opening is left at the upper and anterior part for the paſſage of the obturator artery, vein, and nerve. This opening is obſerved to be larger than would ſuffice for the tranſmiſſion of theſe parts. Its margin is partly formed by the ligament, and partly by a conſiderable oblique notch in the under ſurface of the horizontal branch of the os pubis.

Protruſions of the viſcera through ſuch opening conſtitute thyroideal herniæ, a diſeaſe, whoſe occaſional exiſtence has now been put out of all doubt, though the caſe may be deemed uncommon.

Henermann found a piece of ileum, equal in length to a finger and a half, protruded at the foramen ovale. The ſac was covered by the firſt and ſecond heads of the triceps and the pectinalis. (Chirurgiſche Operationen, b. i. p. 578.) An entero-epiplocele has been ſeen in the ſame ſituation in a young man ſeventeen years of age. (Klinkoſch in Diſſertat. Med. Pragens, vol. i. p. 185.) Camper met with protruſions of the peritoneum at the obturator foramen in the dead ſubject. (Demonſtrat. Anatomico-patholog. lib. ii. p. 17.) Our countrymen, Mr. Aſtley Cooper and Mr. W. Lawrence, have witneſſed the ſame fact. Therefore, whatever doubts may prevail reſpecting the reality of Garengeot's caſes of thyroideal hernia, in the Mém. de l'Acad. de Chirurgie, which have been ſuppoſed by Richerand and others to be only femoral ruptures, there is now ſufficient evidence to prove that the diſeaſe ſometimes occurs.

In ſhort, Mr. Aſtley Cooper has diſſected ſuch a caſe. The hernia deſcended above the obturatores muſcles. The os pubis was before the neck of the ſac; three-fourths of it were ſurrounded by the obturator ligament; and the fundus of the ſac lay beneath the pectineus and adductor brevis muſcles. The obturator nerve and artery were ſituated behind the neck of the ſac, a little towards its inner ſide. On Crural Hernia, &c. p. 70.

In conſequence of the hernia of the foramen ovale being covered by thoſe large muſcles, the pectinalis and triceps, it cannot well form an external ſwelling, and of courſe has generally eſcaped obſervation till after death. However, if one of Garengeot's caſes be correct, the diſeaſe, which was ſtrangulated, not only made an external ſwelling, but was reduced and went up with a guggling noiſe.

Were a ſurgeon to meet with this ſpecies of rupture, the ſame treatment would be required as is applicable to hernia in general. The hernia, if poſſible, ſhould be reduced, and kept up with a ſuitable truſs. Should it become ſtrangulated, and not be relieved by the uſual means, the ſurgeon would be called upon to perform an operation, inconvenient as it would be, to cut through ſuch a thickneſs of parts. We need ſcarcely lay down the caution to avoid injuring the crural veſſels and nerves. The diviſion of the obturator ligament and mouth of the hernial ſac is to be made inwards ſo as not to endanger the obturator artery. However, in the event of its ariſing in common with the epigaſtric artery, it would not be quite out of all hazard in this mode of operating.

Iſchiatic Hernia.—This diſeaſe is rare; but that it may happen is completely proved by well authenticated facts. The caſe has ſeldom or never been aſcertained till after death, in conſequence of the tumour being ſmall, and lying under the glutæus maximus muſcle. An inſtance, which was ſtrangulated and undiſcovered till after the patient's deceaſe, is recorded in the ſecond part of Mr. Aſtley Cooper's work on hernia. The particulars were communicated to the gentleman by Dr. Jones, ſo well known for his accurate and able elucidations of the ſubject of hemorrhage. The diſeaſe happened in a young man twenty-ſeven years of age. On opening the abdomen, the ilium was found to have deſcended on the right ſide of the rectum into the pelvis, and a fold of it was protruded into a ſmall ſac, which paſſed out of the pelvis at the iſchiatic notch. The inteſtine was adherent to the ſac at two points; the ſtrangulated part, and about three inches on each ſide, were very black. The inteſtines towards the ſtomach were very much diſtended with air, and here and there had a livid ſpot upon them. A dark ſpot was even found upon the ſtomach itſelf, juſt above the pylorus. The colon was exceedingly contracted, as far as its ſigmoid flexure. A ſmall orifice was found in the ſide of the

the pelvis, in front of, but a little above the ſciatic nerve, and on the forepart of the pyriform muſcle. The ſac lay under the gluteus maximus muſcle, and its orifice was before the internal iliac artery, below the obturator artery, but above the vein. It is remarked by Mr. Aſtley Cooper, that a reducible caſe might be kept up with a ſpring truſs, and that, were a ſurgeon to be under the neceſſity of operating, the orifice of the ſac ought to be divided directly forwards.

The ſwelling was ſmall, and its exiſtence not ſuſpected during the patient's life.

Although it would appear, that the iſchiatic hernia is in general ſo ſmall as to eſcape detection till after death, an example of a very oppoſite nature is recorded in Papen's Epiſtola de Stupenda Hernia Dorſali. A woman was afflicted with an enormous tumour, which hung down from her buttock as low as her knee. She was compelled to lie on her left ſide, to ſuſpend the tumour from her back when at work, and to raiſe and compreſs it in order to promote the evacuation of the feces. The woman died ſuddenly at harveſt-work. The hernial ſac was formed by the peritoneum, and was found to contain moſt of the ſmall inteſtines, and a portion of the colon, beſides omentum. The poſition of the ſtomach appeared to be perpendicular, the pylorus lying at the entrance of the ſac.

Some doubts have been entertained concerning this caſe being an iſchiatic hernia, a particular deſcription of the opening, at which the parts were protruded not being given, and the tumour attaining ſuch a magnitude as ſeems almoſt impoſſible, conſidering the nature and ſituation of a real iſchiatic hernia.

Phrenic Hernia.—The abdominal viſcera are occaſionally protruded through apertures or lacerations in the diaphragm, and when this ſpecies of hernia becomes ſtrangulated, the patient cannot poſſibly be ſerved by any ſurgical operation, nor, indeed, can the nature of his affliction be aſcertained till an examination is made after death.

A common cauſe of ſuch protruſions is a mal-formation of the diaphragm, which has a preternatural deficiency in it, forming a communication between the cavities of the cheſt and abdomen. In other inſtances, a portion of inteſtine has been forced between the muſcular fibres, ſo as to lie in a hernial ſac compoſed of the peritoneum and pleura. In ſome caſes, a part of the abdominal viſcera has paſſed into the thorax through accidental wounds of the diaphragm. In other examples, the protruſion happens through one of the natural apertures in this muſcular partition.

The caſes of phrenic herniæ on record are extremely numerous. In Mr. Lawrence's treatiſe on ruptures, the following references are given to caſes where the viſcera have been protruded through preternatural openings in the diaphragm.

Holt in Philoſ. Tranſ. abridged, v. iv. p. 630. Fothergill in Philoſ. Tranſ. N 468, or in his Works, vol. i. Macaulay in Medical Obſervations and Inquiries, vol. i. N 4. Morgagni, De Cauſis et Sedibus Morborum, ep. 54, art. 12 and 13. Lieutaud Hiſtor. Anatomico-Med. t. i. obſ. 212, &c. Klinkoſch, Diſſertat. Med. Select. Pragens, t. i. p. 187. Bonn Deſcriptio Theſauri Hoviani. Le Blanc Operations de Chirurgie, tom. ii. p. 414. Petit Traité des Mal. Chirurgicales, tom. ii. p. 261, &c. Chauvet, Hiſt. de l'Acad. des Sciences, 1729, p. 11. Vicq d'Azyr, ibid. 1772, p. 2. Clark in Tranſact. of a Society for promoting Medical and Chirurgical Knowledge, vol. ii. p. 118. Medical Records and Reſearches, art. 1. Monro on Crural Hernia, p. 10. Cooper on Crural and Umbilical Hernia, p. 76, et ſeq.

For caſes where the protruſion has happened between the muſcular fibres, Mr. Lawrence refers us to Petit, Traité des Mal. Chirurg. tom. ii. p. 266, Bowles in Medical Records and Reſearches. p. 15.

For examples in which the protruſion has occurred through wounds of the diaphragm, we are referred by Mr. Lawrence to Fabricius Hildanus, cent. 2. obſ. 33. Blancard, Anat. Pract. Rational. Muys, Prax. Med. Chirurg. dec. 5, obſ. 2. Plenk Sammlung von Beſbachtungen, 1 theil. Derrecagaix in the Pariſian Chirurgical Journal. Cooper, part. 2. p. 80.

Meſenteric Hernia.—It is well known that the meſentery is a double membrane, conſiſting of two layers. When one of theſe layers is torn, while the other remains in its natural ſtate, the inteſtines may inſinuate themſelves into the aperture, and form a kind of hernia. The ſame conſequence may ariſe from an imperfect formation of one of the layers. A caſe of this laſt kind is recorded by Mr. Aſtley Cooper, in his work on Crural Hernia, p. 82.

Meſocolic Hernia.—The bowels may inſinuate themſelves between the layers of the meſocolon, as well as between thoſe of the meſentery, as is proved by a ſpecimen of the diſeaſe preſerved in the muſeum of St. Thomas's hoſpital. In ſhort, the viſcera may glide into any preternatural opening which may exiſt in any of the peritoneal proceſſes, which are compoſed of two layers. The bowels have thus become entangled in the ligamentum latum uteri, omentum, &c.

We ſhall conclude the ſubject of ruptures with enjoining the practitioner never to forget, that beſides the common forms of ſtrangulation, there are others which may happen within the abdomen, and cauſe conſiderable embarraſſment. Theſe may be caſes of the deſcription juſt now given; or they may be inſtances where adheſions leave an opening, in which the bowel becomes confined; or, laſtly, the bowel may be ſurrounded at the mouth of the hernial ſac with membranous bands, which being reduced with the inteſtine, may conſtrict it within the belly, and bring on a ſtate of incarceration.

HERNIA *Cerebri.* See FUNGUS *Cerebri.*

HERNIA *Humoralis* is a term commonly applied to an acute inflammation of the teſticle. The inflammatory affection of this organ cannot be miſtaken. It is evinced by the pain and ſwelling of the part, and by the redneſs and tenſion of the ſcrotum, which becomes ſmooth and uncorrugated. The pain ſhoots up the ſpermatic cord towards the loins, and unleſs a ſuſpenſory bandage be worn, the leaſt motion cauſes an aggravation of the uneaſy ſenſations. At firſt the body of the teſticle is affected with a ſoft pulpy fulneſs, the part being exceedingly tender when handled. This fulneſs increaſes to a hard ſwelling, accompanied with conſiderable pain. The hardeſt part is in general at the lower portion of the epididymis, as may be plainly felt. Very frequently, the ſpermatic cord is affected, eſpecially the vas deferens, which is thickened, and exceedingly painful when touched. The complaint is attended with inflammatory fever; the pulſe is hard, ſtrong, and frequent; the urine high-coloured, and in little quantity, &c.

Inflammation of the teſticle may be brought on by cauſes ſimilar to thoſe which induce this affection in other parts. A contuſion of the ſcrotum may occaſion a hernia humoralis; we ſee it purpoſely cauſed by the ſurgeon, when he undertakes the radical cure of a hydrocele. But the moſt common cauſe of this complaint is irritation in the urethra. Hence, it more frequently ariſes in conſequence of a gonorrhœa than any other cauſe; and perſons with very bad ſtrictures, for which they are uſing bougies, are much expoſed

to

to its attack. When hernia humoralis is the conſequence of a gonorrhœa, it moſtly happens that, juſt about the time when the teſticle begins to ſwell, the diſcharge from the urethra either ſtops entirely, or undergoes a ſudden and remarkable diminution. On this account, the generality of ſurgical writers impute the hernia humoralis to the ſtoppage of the clap, while it ſeems quite as likely that the change in the latter complaint may depend upon the acceſs of the other. However, ſince an inflammation of the teſticle does not uſually originate when a clap is ſuddenly checked or ſtopped; and, further, ſince the caſe of hernia humoralis is not conſtantly attended, at its commencement, with an abatement, or ceſſation of the diſcharge from the urethra, we do not feel warranted in believing that there is any certain and incontrovertible theory on the ſubject. With the believers in the doctrine of metaſtaſis, the hernia humoralis has always been a favourite illuſtration, the tranſition of a diſeaſe from the urethra to the teſticle appearing to them to be here ſo evident and unqueſtionable. We cannot pretend to offer any other explanation of the cauſe of the hernia humoralis, in conſequence of a gonorrhœa, than that it proceeds from irritation in the urethra. It is alſo certain, that when a patient is affected with pain in making water, a diſcharge of matter from the urethra, &c. the teſticles are particularly tender and ſuſceptible of inflammation. And we find, that the latter complaint is more apt to come on under certain circumſtances, which ſeem all to operate on the principle, either of increaſing the irritation in the urethra, or of manifeſtly extending it to the teſticle.

Thus, it is remarked by writers on ſurgery, that, in caſes of gonorrhœa, hernia humoralis is moſt liable to occur when the patient neglects himſelf and is guilty of exceſſes; when, notwithſtanding the ſeverity of the clap, he does not ſupport the ſcrotum in a bag-truſs, but takes violent exerciſe, and does not rigorouſly abſtain from wine and women. Many authors are inclined to the opinion, that employing aſtringent injections, or bougies, in caſes of gonorrhœa, renders the patient diſpoſed to hernia humoralis.

Not only does the diſcharge from the urethra in general ſtop, or diminiſh, upon the acceſs of hernia humoralis; the pain in making water alſo ſuddenly ſubſides. In almoſt all inſtances the patient has not the good fortune to be permanently freed from the gonorrhœa; nor can it be ſaid that this is exchanged for the ſwelling of the teſticle; for as ſoon as the hernia humoralis begins to get better, the ſtrangury and diſcharge from the urethra uſually return again.

With regard to the treatment of the preſent diſeaſe, the patient is to be adviſed to keep himſelf quiet in bed, and to abſtain from meat and ſpirits. When he is young, or ſufficiently ſtrong, and when the ſwelling is great, and the pain ſhooting up to the loins, ſevere veneſection ought to be practiſed. It may be ſet down, that topical bleeding with leeches is invariably proper, and ſhould be at firſt repeated from day to day. Febrifuge medicines and ſaline purgatives are alſo indicated.

The pain in the loins will be relieved by quietude and bleeding; but when it is exceſſively ſevere, the practitioner will be juſtified in preſcribing opiates. But, ſuſpending the ſcrotum in a bag-truſs, ſo as to prevent the teſticle from hanging by the ſpermatic cord, will have more effect than any other meaſure, in leſſening the ſevere pain which patients moſtly experience in the lumbar region. Perhaps, indeed, a ſuſpenſory bandage, in caſes of hernia humoralis, is of more conſequence than all the reſt of the treatment together; and ſo immediately convinced is the patient of the great relief he derives from it, that, when once he has put it on, there is little danger of his neglecting to perſiſt in its uſe. Before applying the bag-truſs, the opportunity is to be taken to uſe leeches, and, on theſe being removed, the whole ſcrotum is to be covered with a ſoft linſeed poultice. There are practitioners, who prefer the ſaturnine lotion, and other cold applications; and we believe caſes do occur, where ſuch means afford moſt eaſe and comfort. The choice, we think, ſhould be principally regulated by the feelings and evidence of the patient himſelf.

After all active inflammation in the teſticle is obviated, the epididymis frequently remains conſiderably hardened. Such induration generally admits of being in part diſperſed by frictions with camphorated mercurial ointment, though it often happens that a degree of hardneſs will remain for life, notwithſtanding the fulleſt trial of diſcutient remedies. Since, however, it is unattended with any pain or uneaſineſs, it is of little importance, unleſs Mr. Hunter's conjecture be true, that many teſticles which continue thus indurated, cannot execute the functions for which they are deſigned in the animal economy, in conſequence of the epididymis being, perhaps, impervious.

The ſuppoſition, that in caſes of gonorrhœa the hernia humoralis ariſes altogether from the ſtopping of the diſcharge, has led to the abſurd practice of endeavouring to renew the ſecretion of matter from the urethra, by irritating the paſſage with bougies, applying emollients to the penis, &c. The truth is, that ſuch methods are neither ſupported by any accurate theory, nor are they productive of real benefit in practice; conſequently, they are not followed by any eminent ſurgeons in this country, nor can a ſerious comment on the abſurdity of the practice be neceſſary.

HERNIARIA, in *Botany*, is ſo called from *hernia*, a *rupture*, this plant having been very abſurdly ſuppoſed to be beneficial in that complaint, though it is ſcarcely poſſible to conceive that ſo fooliſh an idea ſhould ever have obtained, becauſe any mode of relief for that diſeaſe muſt, from the nature of it, be purely mechanical.—Linn. Gen. 121. Schreb. 170. Willd. Sp. Pl. 1296. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 271. Juſſ. 89. Lamarek Dict. v. 3. 124. Illuſtr. t. 180.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Holoraceæ*, Linn. *Amaranthi*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, five-cleft, acute, ſpreading, coloured internally, perſiſtent. *Cor.* none. *Stam.* Filaments five, awl-ſhaped, minute, withinſide of the ſegments of the calyx; anthers ſimple (there are alſo five barren filaments alternating with the ſegments of the calyx). *Piſt.* Germen ovate; ſtyle ſcarcely perceptible; ſtigmas two, acute, about the length of the ſtyle. *Peric.* Capſule ſmall, in the bottom of the calyx, covered, ſcarcely burſting. *Seed* ſolitary, ovate-acuminate, ſhining.

Eſſ. Ch. Cal. in five ſegments, inferior. Cor. none. Stamens with five thread-ſhaped ſcales between them. Capſ. with one ſeed, covered with the calyx.

1. *H. glabra.* Linn. Sp. Pl. 317. Engl. Bot. t. 206. Fl. Dan. t. 529.—"Whole plant herbaceous and ſmooth."—Native of gravelly ſoil in various parts of Europe, flowering about July and Auguſt.—*Root* perennial, ſpindle-ſhaped. *Stems* proſtrate, round, leafy. *Leaves* ovate, entire, ſomewhat fringed at the margin; lower ones oppoſite; upper ones alternate. *Stipulas* membranaceous. *Flowers* ſeſſile, heaped together in cluſters, yellowiſh-green. *Calyx* cloſed after flowering, and embracing the ripe capſule.

2. *H. hirſuta.* Linn. Sp. Pl. 317. Engl. Bot. t. 1379. Pet. H. Brit. t. 10. f. 10.—"Whole plant herbaceous and hairy."—Found in a ſandy ſoil, though leſs commonly than the laſt, flowering in July and Auguſt.—This is alſo a perennial, and is generally conſidered as a mere variety of *H. glabra*, differing only in being clothed all over with ſhort, minute,

minute, rigid briſtles or hairs, with which the leaves are alſo ſtrongly fringed. A Swiſs ſpecimen of *H. glabra* has been diſcovered with pubeſcence on its ſtem, which evidently betrays an approach to the plant before us.

3. *H. alpina.* Willd. n. 3. Villars Dauph. v. 2. 556.—"Leaves obovate, acute, fringed at the margin. Flowers denſely cluſtered, five-cleft, hairy."—Native of the hills of Dauphiny, and gathered in great luxuriance, by Dr. Smith on Mount Cenis, in Auguſt 1787. This is remarkable for its extremely long, ſimple *root*, bearing a very wide-ſpreading depreſſed tuft, compoſed of innumerable matted ſtems and branches. The whole is ſometimes a foot wide, but more commonly four or five inches. The obovate ſhape of its leaves diſtinguiſhes it from either of the foregoing, and the hairs, which more or leſs clothe every part, are much more long, lax, and ſpreading than even in *H. hirſuta*.

4. *H. macrocarpa.* Sm. Prod. Fl. Græc. v. 1. 167.—"Leaves obovato-lanceolate, hairy on both ſides as well as the calyx. Stems clothed with recurved hairs."—Found by Dr. Sibthorp on the road ſide between Smyrna and Burſa, as well as in Laconia. We have alſo a ſpecimen from the Balearic iſlands.—It has a great reſemblance to the laſt ſpecies, but the leaves are narrower, the fruit larger, the pubeſcence much finer and more denſe in general, and that of the ſtem is reflexed or recurved.

5. *H. fruticoſa.* Linn. Sp. Pl. 317; (Polygonum Herniariæ foliis et facie, perampla radice Aſtragaliti; Lob. Ic. v. 2. 85. Ger. em. 1594.)—Stem ſhrubby, downy. Leaves obovate, fleſhy, keeled, almoſt naked. Stipulas fringed with long hairs. Flowers four-cleft.—Gathered in Spain by Lœfling.—Very curious for the thick woody ſtem and branches, altogether three or four inches high, and widely ſpreading. The minute, thick, cluſtered leaves form, as it were, little balls, and are for the moſt part ſmooth, or nearly ſo, but are accompanied by ſuch very long, white, deeply-fringed ſtipulas, that each tuft has the appearance of being hairy. The *flowers* we have not examined, but Linnæus deſcribes them four-cleft.

6. *H. polygonoides.* Cavan. Ic. v. 2. 27. t. 131. (Illecebrum ſuffruticoſum; Linn. Sp. Pl. 298.)—Stem ſomewhat ſhrubby, upright. Leaves ovate, acute, with a terminal briſtle, naked.—Native of riſing ground in various parts of Spain, flowering in May and June.—The figure of Cavanilles agrees with the Linnæan ſpecimen, which removes his doubts, and he has unqueſtionably done right in removing it to this genus. The *flowers* are extremely minute at the tops of the branches and from the boſoms of the upper leaves.

Theſe are all the ſpecies of *Herniaria* known to us. *H. lenticulata* of Linnæus has always been a puzzling plant to botaniſts. His original ſpecimen, undoubtedly what he intended, is no other than *Creſſa cretica*, to which the ſynonym he quotes of Buxbaum, Cent. 1. t. 28. belongs; but the *Polygonum maritimum longius radicatum noſtras*, of Dillenius in Ray's Synopſis, 161. Pluk. t. 53. f. 3, figured alſo in Petiver's Engliſh Plants, t. 10. f. 6. is moſt unqueſtionably only *Glaux maritima*, as indicated under *Herniaria glabra*, H. Brit. 272.

H. lenticulata, therefore, may be preſumed a non-entity. What *Polygonum minus lentifolium*, Bauh. Prod. 131. may be, which ſeems to have ſuggeſted to Linnæus the ſpecific name, we do not recollect that we have ever had an opportunity of aſcertaining.

HERNICI, in *Ancient Geography*, a people of Italy, of Sabine origin, eſtabliſhed in Latium. They inhabited the mountains which extended themſelves from thoſe of Præneſte to Sora. Their principal towns were Anagnia, Alatrium, Ferentum, Pitalum, Hernicum, and Verulum. Theſe people, being naturally warlike, and advantageouſly occupying theſe mountains, fought for ſome time againſt the Romans, but they afterwards ſubmitted, and were comprehended among the Latin people.

HERNOSAND, or HERNOSUND, in *Geography*, a ſea-port town of Sweden, in the province of Angermania, built in 1584 by John III. on an iſland in the gulf of Bothnia, ſeparated from the continent by a narrow channel, over which was thrown a bridge. On the N. ſide of the harbour, the water is of ſufficient depth for the largeſt veſſels to unload at the warehouſes. Hernoſand was formerly a ſtaple town, and ſtill carries on a conſiderable trade, particularly in linen. N. lat. 62° 38'. E. long. 17° 43'.

HERNSHAW, or HERNARY, a place where herons breed.

HERO, in the *Ancient Theology*, and *Mythology*, a great and illuſtrious perſon, of mortal nature, though by the populace ſuppoſed to partake of immortality, and after his death, placed by them among the number of the gods. The word is formed of the Latin *heros*, and that of the Greek ἥρως, *ſemideus*, *demi-god*. St. Auguſtine, De Civit. Dei, lib. x. obſerves, that it is highly probable, that ſome one of Juno's ſons was originally called by this name; that goddeſs being called in Greek Ἥρη; or it may be, that great men were diſtinguiſhed by this appellation; in alluſion to the opinion of the ancients, that virtuous perſons, after their deaths, inhabit the wide expanſe of the air, which is Juno's province. Iſidore inclines to think, that heroes were thus called *quaſi aeroes*, *aerei*, perſons of ſuperior merit and worthy of heaven. Plato derives the word from the Greek ἔρος, *love*; as intimating the heroes to have riſen from the copulation of a god with a mortal woman; or of a goddeſs with a man. Others derive the name from the Greek εἰρεῖν, *dicere*, *to ſpeak*; the heroes being perſons who, by their eloquence, led the people at their pleaſure. Others, laſtly, derive it from the Greek ἔρα, *terra*, *earth*; the heroes, on their principle, being the *dii terreſtres*, or *gods of the earth*.

Heroes were, properly, perſons partly of divine, and partly of human extraction; being produced between the deity and a mortal; as Achilles, who was the ſon of the goddeſs Thetis, by Peleus; and Hercules, who was the ſon of Jupiter, by Alcmena.

A hero, then, coincides with what we otherwiſe call a *demi-god*; accordingly, Lucian defines a hero to be a medium between a god and a man; or rather, a compoſition of both.

The Greeks erected columns and other monuments over the tombs of their heroes, and eſtabliſhed a kind of worſhip in honour of the manes both of their heroes and heroines. The Romans alſo raiſed ſtatues in honour of their heroes; but there were ſix of their heroes of a ſuperior order, and who were ſuppoſed to be admitted into the community of the twelve great gods; theſe were Hercules, Bacchus, Eſculapius, Romulus, Caſtor, and Pollux. Writers have diſtinguiſhed between the worſhip which the ancients paid to their heroes, and that offered to their gods. The latter, it is ſaid, conſiſted of ſacrifices and libations; the former was only a kind of funeral honour, in which they celebrated their exploits, concluding the rehearſal with feaſts.

HERO is alſo uſed in a more extenſive ſenſe, for a great, illuſtrious, and extraordinary perſonage; particularly in reſpect of valour, courage, intrepidity, and other military virtues.

F. Bohours makes this diſtinction between a great man and a hero, that the latter is more daring, fierce, and enterpriſing; and the former more prudent, thoughtful, and reſerved.

ſerved. In this ſenſe we properly ſay, Alexander was a hero, Julius Cæſar a great man.

HERO *of a poem*, or *romance*, is the principal perſonage, or he who has the chief part in it.

Thus the hero of the Iliad is Achilles; of the Odyſſey, Ulyſſes; of the Æneid, Æneas; of the Pharſalia of Lucan, Pompey; of Taſſo's Jeruſalem, Godfrey of Bulloign, or, as Blair thinks, Rinaldo, copied in part after Homer's Achilles; of the Luſiad of Camoens, Vaſco; of Milton's Paradiſe Loſt, Adam; though Mr. Dryden will have the devil to be Milton's hero, becauſe he gets the better of Adam, and drives him out of Paradiſe.

The character of Achilles is the inexorable wrath of a haughty, valiant, unjuſt, and revengeful prince. Homer has been blamed for making his hero of too brutal and unamiable a character. But injuſtice, ſays Blair, is commonly done to Achilles, upon the credit of two lines of Horace, who has certainly overloaded his character:

"Impiger, iracundus, inexorabilis, acer,
Jura neget ſibi nata; nihil non arroget armis."

Although Achilles is paſſionate to a great degree, he is far from being a contemner of laws and juſtice. Beſides his wonderful bravery and contempt of death, he has ſeveral other qualities of a hero. He is open and ſincere, he loves his ſubjects, and reſpects the gods. He is diſtinguiſhed by ſtrong friendſhips and attachments; he is, throughout, high-ſpirited, gallant, and honourable; and allowing for a degree of ferocity which belonged to the times, and enters into the characters of moſt of Homer's heroes, he is, upon the whole, abundantly fitted to raiſe high admiration, though not pure eſteem. (See ILIAD.) The character of Ulyſſes, is the wiſe and prudent diſſimulation of a courageous king, whoſe conſtancy nothing could ſhake. (See ODYSSEY.) The character of Æneas is piety, goodneſs, gentleneſs, good nature, and humanity, ſuſtained, like the others, with an invincible courage.

Many of the critics find fault with the hero of the Æneid; they ſay he is too ſenſible and delicate; and wants the fire, firmneſs, and uncontrolable ſpirit, remarkable in the hero of the Iliad. Piety, tenderneſs, and ſubmiſſion to the gods, are the virtues of the middle claſs of mankind; they do not ſtrike and command enough for a hero, who is to be the inſtrument of ſuch notable exploits. St. Evremond looks on Æneas as fitter to have been the founder of a religious order than of an empire. F. Boſſu defends Virgil's hero, or at leaſt Virgil, with admirable addreſs. Æneas's character, he obſerves, was not to be formed on the model, either of Achilles, or Ulyſſes, nor to be of the ſame kind with them; as the fable and the deſign of the Æneid was very different from thoſe of the Iliad and Odyſſey.

What Virgil had in view was, in the opinion of this author, to make the Romans receive a new kind of government, and a new maſter; this maſter, then, muſt have all the qualities requiſite for the founder of a ſtate, and all the virtues which make a prince beloved. The violence of Achilles was, of conſequence, precluded; and ſo was the diſſimulation of Ulyſſes; that being a quality which renders a man ſuſpected, not beloved.

Virgil was reſtrained in his choice; his hero was to be of the genius of Auguſtus; and the poet was in the condition of a painter, who is obliged to accommodate a piece of hiſtory to the model of a face that is given him. But that the Æneid bears conſtant reference to the character and reign of Auguſtus, though it be an opinion maintained by ſome critics, has been denied by others. (See ÆNEID.) The character of Homer's two heroes, as being directly oppoſite to his deſign, he has thrown upon Turnus and Mezentius, who are the counterparts to his hero.

It is diſputed among the critics, whether it be neceſſarily required, that the hero of an epic poem be a good and virtuous man? F. Boſſu maintains the negative; between a hero in morality, and a hero in poetry, the ſame diſtinction is to be made, as between moral and poetical goodneſs. Hence as the manners of Achilles and Mezentius are poetically as good as thoſe of Ulyſſes and Æneas, ſo thoſe two cruel and unjuſt men are as regular poetical heroes, as theſe two juſt, wiſe, and good men.

Ariſtotle, indeed, repreſents the heroic virtue, as a virtue more than human: and of conſequence, heroes, as divine perſons, whom the excellency of their nature raiſes above our claſs; but this he ſays only in his books of morality: in his Poetics he ſpeaks another language. The prime perſon of a poem, whom he calls the hero, he there obſerves, muſt neither be good nor bad, but between both: he muſt not be either ſuperior to the generality of mankind, by his virtue and juſtice; nor inferior to them, by his crimes and wickedneſs: the moral and epic heroes, therefore, even on Ariſtotle's principles, have nothing in common with each other; the one muſt be raiſed above mankind, and the other muſt not be on a level with the moſt perfect of men.

In effect, reaſon, the nature of the poem, which is to be a fable, the practice of Homer, and the rules of Ariſtotle and Horace, all agree that ſo far is it from being neceſſary that the hero of an epopea be a perfect, faultleſs man, that it is not neceſſary he be an honeſt man: and that it is no ways irregular to make him as perfidious as Ixion, as unnatural as Medea, or as brutal as Achilles.

It is another ſubject of controverſy among the critics, whether the cataſtrophe or concluſion of the action, is neceſſarily to leave the hero happy, and at eaſe; or whether it be allowable to leave him unhappy?

The general practice of the heroic poets ſtands for the firſt. We have ſcarce an example of a hero who is overcome, and remains unhappy; excepting Adam in Milton. In tragedy, the caſe is different: unhappy cataſtrophes, according to Ariſtotle, are preferable to happy ones, and were always much better received among the ancients. The tragic ſcene is the throne of the paſſions; and terror and pity are there to rule in a peculiar manner: now theſe paſſions ariſe the moſt naturally from unhappy events: and the audience, quitting the theatre full of the misfortunes wherewith the piece was cloſed, preſerve their concern much longer, and feel more forcible effects from it, than if their tears had been wiped away, and their ſighs untied, in the ſatisfaction of a more happy peripetia.

But theſe reaſons have no place in the epopea; which is not intended ſo much to affect the paſſions, as to inſpire ill habitudes. But it is true, withal, that the epopea does not exclude all unhappy concluſions; the nature of epic fable is ſuch as admits equally of good and bad perſons for the prime parts; the unhappy adventure of a lamb unjuſtly devoured by a wolf, is a ſubject every way as inſtructive, and as regular, as the generoſity of a lion, who lets himſelf be diſarmed of his rage by the innocence of the lamb.

It is true, if the poet propoſed his hero as a pattern of perfection for imitation, the misfortunes falling on him would ſuit very ill with the deſign: but this was, doubtleſs, the fartheſt thing from the intentions of the great maſters of the epopea above-mentioned. The only reaſon, perhaps, that can be given for the uniform practice of the poets in this reſpect, is, that an epic poem containing an action of much more

more extent than that of a tragic poem, the reader would not be ſo well ſatisfied, if, after ſo many labours and difficulties as the hero is brought to ſtruggle with, he ſhould not at laſt be brought off, but periſh miſerably. There is ſomething, no doubt, great and good in the hero, which in the courſe of the poem, make us concerned for him; ſo that, after ſo long an acquaintance, we cannot leave him miſerable without ſome anxiety: which is not the final buſineſs of the poet to raiſe. See EPIC *poem*.

HERO, in *Biography*. There were two celebrated mathematicians of antiquity of this name, who are uſually diſtinguiſhed by the epithets, Hero the *elder*, and Hero the *younger*. The firſt was a native of Alexandria, and the diſciple of Cteſias, who flouriſhed in the reigns of Ptolemy Philadelphus, and Euergetes I. He was diſtinguiſhed by his great ſkill in mechanics, and particularly in the conſtruction of machinery; as a moraliſt he was inclined to the tenets of Epicurus. He was author of a treatiſe "De Conſtructione et Menſura Manubaliſtæ," of which a fragment was publiſhed in Greek by Bernardino Baldi: "De Telis conficiendis jaculandiſque Liber," publiſhed with notes by Baldi: "Spiralia," publiſhed in 1575 by Frederic Commandine; and "De Automatorum Fabrica." Theſe are all to be found in the Grand Louvre edition of the "Ancient Mathematicians." The younger Hero is ſuppoſed to have flouriſhed under the reign of the emperor Heraclius. He was author of "De Machinis Bellicis:" "Geodœſia:" "Liber de Obſidione Repellenda et Toleranda;" and "De Vocabulis Geometricis et Stereometricis." Moreri.

HERO, *North*, in *Geography*, an iſland in lake Champlain, which is a townſhip annexed to Chittenden county, in Vermont, 13 miles long and 2 broad, and contained, in 1790, 125 inhabitants.

HERO, *South*, an iſland in the ſame lake, belonging to the ſame county, which is a townſhip and port of entry, and contains 678 inhabitants; it is 14 miles long, and $3\frac{1}{2}$ broad. The Heros are ſurrounded by ſeveral ſmall iſles. This iſland produces good crops of wheat and other grain. In it is a quarry of blueiſh grey marble, which has the appearance of being a petrifaction of ſcollops, a ſpecies of ſhell abounding in the vicinity of the lake, together with the common earth of the ſhore, which is of a marley ſubſtance. South Hero was divided, in 1798, into two townſhips, the ſouthernmoſt retaining its original name, and the northernmoſt that of "Middle Hero," and containing 621 inhabitants.

HERO, in *Fabulous Hiſtory*, a prieſteſs of Venus, who lived at Abydus, in a tower ſituated on the banks of the Helleſpont. Her lover Leander, who lived at Seſtus, on the other ſide of the ſtrait, at the oblique diſtance of 30 ſtadia, ſwam over every night to viſit her, guided by a light fixed on the tower. But in a ſtormy night the light was extinguiſhed, and the youth miſſing his way, was drowned; upon which Hero threw herſelf into the ſea and periſhed. This improbable tale is expoſed by M. Mahudel, but is defended on the authority of poets and medals by M. de la Nauze. Acad. des Inſcript. tom. vii. Hiſt. p. 74. Mem. 240.

HEROD, in *Biography*, furnamed the *Great*, king of the Jews, ſecond ſon of Antipater the Idumæan, was born in the year before Chriſt, 71. At the age of 25 he was made by his father governor of Galilee, and diſtinguiſhed himſelf by the ſuppreſſion of a band of robbers, with the execution of their leader Hezekiah, and ſeveral of his comrades. As he had performed this act of heroiſm by his own authority, and had executed the culprits without the form of trial, he was ſummoned before the Sanhedrim, but through the ſtrength of his party and zeal of his friends, he eſcaped any cenſure. In the civil war between the republican and Cæſarian parties, Herod joined Caſſius, and was made governor of Cœleſyria, and when Mark Antony arrived victorious in Syria, Herod and his brother found means to ingratiate themſelves with him, and were appointed as tetrarchs in Judea, but in a ſhort time an invaſion of Antigonus, who was aided by the Jews, obliged Herod to make his eſcape from Jeruſalem, and retire firſt to Idumæa, and then to Egypt. He at length arrived at Rome, and obtained the crown of Judea upon occaſion of a difference between the two branches of the Aſmodean family. Hyrcanus had been for a conſiderable time prince and high prieſt of the Jewiſh nation; but whilſt the Roman empire was in an unſettled ſtate, after the death of Julius Cæſar, Antigonus, ſon of Ariſtobulus, brother of Hyrcanus, made himſelf maſter of the city and all Judea. In this ſtate Herod found things when he came to Rome, and the moſt that he then aimed at was to obtain the kingdom for Ariſtobulus, his wife's brother, but the ſenate of Rome, moved by the recommendations of Mark Antony, conferred the kingdom of Judea upon Herod himſelf. Having met with this unexpected ſucceſs at Rome, he returned without delay to Judea, and in about three years got poſſeſſion of the whole country. He had, however, to fight his way to the throne, which, as we have ſeen, was in the poſſeſſion of Antigonus; though aided by the Roman army, he was obliged to lay ſiege to Jeruſalem, which held out for ſix months, when it was carried by aſſault, and a vaſt ſlaughter was made of the inhabitants, till the interceſſion and bribes of Herod put an end to it. Antigonus was taken priſoner and put to death, which opened the way to Herod's quiet poſſeſſion of the kingdom. His firſt cares were to repleniſh his coffers, and to repreſs the faction ſtill attached to the Aſmodean race, and which regarded him as an uſurper. He was guilty of many extortions and cruelties in the purſuit of theſe objects. Shortly after this an accuſation was lodged againſt Herod before Mark Antony by Cleopatra, who had been influenced to the deed by his mother-in-law Alexandra. He was ſummoned to anſwer to the charges exhibited againſt him before the triumvir, and on this occaſion he gave a moſt remarkable diſplay of the conflict of oppoſite paſſions in a ferocious heart. Doatingly fond of his wife Mariamne, and not being able to bear the thought of her falling into the hands of another, he exacted a ſolemn promiſe from Joſeph, whom he appointed to govern in his abſence, that ſhould the accuſation prove fatal to him, he would put the queen to death. Joſeph diſcloſed the ſecret to Mariamne, who, abhorring ſuch a ſavage proof of his love, from that moment conceived the deepeſt and moſt ſettled averſion to her huſband. Herod, by great pecuniary ſacrifices, made his peace with Antony, and returned in high credit. Some hints were thrown out reſpecting Joſeph's familiarity with Mariamne during his abſence; he communicated his ſuſpicions to his wife, who, recriminating, upbraided him with his cruel order concerning her. His rage was unbounded; he put Joſeph to death for communicating the ſecret entruſted to him alone, and he threw his mother-in-law, Alexandra, into priſon. Soon after this he received a viſit from Cleopatra, who is ſaid to have entertained amorous inclinations with regard to him. Theſe Herod diſappointed, but glutted her avarice with profuſe donations. In the war between Antony and Octavius, Herod raiſed an army for the purpoſe of joining the former, but he was obliged firſt to engage Malchus, king of Arabia, whom he defeated and obliged to ſue for peace. After the battle of Actium his great object was to make terms with the conqueror, and, as a preliminary ſtep, he put to death Hyrcan, the only ſurviving male of the Aſmodeans;

ans; and having ſecured his family he embarked for Rhodes, where Auguſtus at that time was. He appeared before the maſter of the Roman world in all the regal ornaments, excepting his diadem, and with a noble confidence related the faithful ſervices he had performed for his benefactor Antony, concluding that he was ready to transfer the ſame gratitude to a new patron, from whom he ſhould hold his crown and kingdom. Auguſtus was ſtruck with the magnanimity of the defence, and replaced the diadem on the head of Herod, who remained the moſt favoured of the tributary ſovereigns. When the emperor afterwards travelled through Syria, in his way to and from Egypt, he was entertained with the utmoſt magnificence by Herod, in recompence for which he reſtored to him all his revenues and dominions, and even conſiderably augmented them. His good fortune, as a prince, was poiſoned by domeſtic broils, and eſpecially by the inſuperable averſion of Mariamne, whom at length he brought to trial, convicted, and executed. She ſubmitted to her fate with all the intripidity of innocence, and was ſufficiently avenged by the remorſe of her huſband, who ſeems never after to have enjoyed a tranquil hour. In the way to her execution ſhe was accoſted by her vile mother Alexandra, who, to make her peace with the tyrant, accuſed her own daughter, at the moment when conſolation, rather than unkind uſage, might have been looked for, of ingratitude to an affectionate huſband, and exclaiming, that ſhe juſtly merited her fate. Mariamne, in return, expreſſed only emotions of pity for a mother who could ſo miſbehave herſelf, and ſhe met the fatal blow without even changing co'our. "She died," ſays the learned Prideaux, "as ſhe lived, great, firm, and fearleſs, to the laſt. Thus ended the life of this virtuous and excellent princeſs. In the beauty and other charms and graces of her perſon, ſhe excelled all the women of her time, and would have been a lady without exception, could ſhe have carried it with ſome better temper and compliance towards her huſband; but conſidering that he had built his fortune upon the ruins of her family, that he had uſurped from them the crown which he wore, that he had cauſed her father, her grandfather, her brother, and her uncle, to be put to death, for the ſerving of his deſigns, and had twice ordered her death in caſe of his own, it would put difficulties upon the moſt patient and beſt tempered woman in the world, how to bear ſuch a huſband with any affection or complaiſance." His rage being quenched, Herod endeavoured to baniſh the memory of his evil acts from his mind by ſcenes of diſſipation, but the charms of his once loved Mariamne haunted him wherever he went: he would frequently call aloud upon her name, and inſiſt upon his attendants bringing her into his preſence, as if willing to forget that ſhe was no longer among the living. At times he would fly from the ſight of men, and on his return from ſolitude, which was ill ſuited to a mind conſcious of the moſt ferocious deeds, he became more brutal than ever, and in fits of fury ſpared neither foes nor friends. Alexandra, whoſe malignity towards her daughter has been noticed, was an unpitied victim to his rage. At length he recovered ſome portion of ſelf-poſſeſſion, and employed himſelf in projects of regal magnificence. He built at Jeruſalem a ſtately theatre and amphitheatre, in which he celebrated games in honour of Auguſtus, to the great diſpleaſure of the zealous Jews, who diſcovered Gentile profanation in the theatrical ornaments and ſpectacles. Nothing, it is ſaid, gave them ſo much offence as ſome trophies which he had ſet round his theatre in honour of Auguſtus, and in commemoration of his victories, but which the Jews regarded as images devoted to the purpoſes of idol worſhip. For this and other acts of the king a moſt ſerious conſpiracy was formed againſt him, which he fortunately for himſelf diſcovered, and he exerciſed the moſt brutal revenge on all the parties concerned in it. He next built Samaria, which he named Sebaſte, and adorned it with the moſt ſumptuous edifices, and for his ſecurity he built ſeveral fortreſſes throughout the whole of Judea, of which the principal was called Cæſarea, in honour of the emperor. In his own palace, near the temple of Jeruſalem, he laviſhed the moſt coſtly materials and curious workmanſhip, and his palace Herodion, at ſome miles diſtance from the capital, by the beauty of its ſituation and other apropriate advantages, drew around it the population of a conſiderable city. To ſupply the place of his loſt Mariamne he married a new wife of the ſame name, the beautiful daughter of a prieſt, whom he raiſed to the high rank of the ſupreme pontificate. He ſent his two ſons, by the firſt Mariamne, to be educated at Rome, and ſo ingratiated himſelf with Auguſtus and his miniſters, that he was appointed imperial procurator for Syria. To acquire popularity among the Jews, and to exhibit an attachment to their religion, he undertook the vaſt enterprize of rebuilding the temple of Jeruſalem, which he finiſhed in a noble ſtyle of magnificence in about a year and a half. During the progreſs of this work he viſited Rome, and brought back his ſons, who had attained to man's eſtate. Theſe at length conſpired againſt their father's perſon and government, and were tried, convicted, and executed. Another act, deſerving of notice, performed by Herod, was the dedication of his new city of Cæſarea, at which time he diſplayed ſuch profuſe magnificence, that Auguſtus ſaid "his ſoul was too great for his kingdom." Notwithſtanding the execution of his ſons, he was ſtill the ſlave to conſpiracies from his other near relations. In the 33d year of Herod's reign, which, according to the vulgar era, was the fifth B. C., our Saviour was born. This event was followed, according to the goſpel by St. Matthew, by the maſſacre of the children at Bethlehem. It ought, however, to be obſerved, that ſome modern writers do not admit this fact as ſtanding upon undeniable teſtimony, and it is certain that Joſephus, who was no friend to Herod, makes not the lighteſt alluſion to it whatever; nevertheleſs the candid Lardner, after carefully examining the evidences, thinks the fact deſerving of credit. (See vol. i. Part. Credibility, p. 330—9. 8vo. edit. 1788.) About this time Antipater, returning from Rome, was arreſted by his father's orders, and charged with treaſonable practices: he was found guilty of conſpiring againſt the life of the king. This and other calamities, joined to a guilty conſcience, preying upon a broken conſtitution, threw the wretched monarch into a mortal diſeaſe, which has been repreſented by Euſebius, Joſephus, and others, as a juſt judgment of Heaven on the many foul enormities and impieties of which he had been guilty. His diſorder was attended with the moſt loathſome circumſtances that can be imagined. A premature report of his death cauſed a tumult in Jeruſalem, excited by the zealots, who were impatient to demoliſh a golden eagle which he had placed over the gate of the temple. The perpetrators of this imprudent act were ſeized, and, by order of the dying king, put to death. He alſo cauſed his ſon Antipater to be ſlain in priſon, and his remains to be treated with every ſpecies of ignominy. He bequeathed his kingdom to his ſon Archelaus, with tetrarchies to his two other ſons. Herod, on his dying bed, had planned a ſcene of the moſt horrible cruelty that could be deviſed, and which was to take place at the inſtant of his own death. He had ſummoned the chief perſons among the Jews to Jericho, and cauſed them to be ſhut up in the hippodrome, or circus, and gave ſtrict orders to his ſiſter Salome to have them all maſſacred as ſoon as he ſhould have drawn his laſt breath. For this, ſaid he, will provide mourners for my funeral all over the land, and make the Jews

Jews in every family lament my death, who would otherwiſe exhibit no ſigns of concern. Salome and her huſband Alexas choſe rather to break their oath, extorted by the tyrant, than be implicated in ſo cruel a deed: and accordingly, as ſoon as Herod was dead, they opened the doors of the circus, and permitted every one to return to his own home. Herod died in the thirty-fourth year of his reign, and the ſixty-eighth of his age. His memory has been conſigned to merited deteſtation, while his great talents, and the glories of his reign, have placed him high in the rank of ſovereigns. Joſephus, Antiq. lib. xvii. Prideaux. Lardner, Univer. Hiſt.

HEROD ANTIPAS, or the tetrarch, ſon of the preceding, by his wife Malthace, ſucceeded, at the death of his father, to the poſſeſſion of a great part of Galilee, and the countries beyond Jordan. This is the perſon alluded to by St. Luke, who ſays, ch. iii., "that when the word of God came to John in the fifteenth year of Tiberius, Herod was tetrarch of Galilee, and his brother Philip tetrarch of Iturea," that is, they were in poſſeſſion of the ſame territories and titles which were aſſigned them by their father's will and Auguſtus's decree. It was this ſame Herod, tetrarch of Galilee, to whom our Saviour was ſent by Pilate, when accuſed before him. He had married, as his firſt wife, a daughter of Aretas, an Arabian king, whom he put away, in order that he might marry Herodias, the wife of his brother Philip. This involved him in a war that was carried on to his diſadvantage full four years; it alſo, on account of the inceſtuous nature of his ſecond marriage, diſguſted his own ſubjects, and drew upon him the reproaches of John the Baptiſt, which were the occaſion of that excellent man's impriſonment. The loſs of his liberty was not deemed puniſhment ſufficient to ſatisfy the revengeful paſſions of Herodias; but ſhe laid a ſnare for the life of the Baptiſt. She inſiſted upon her daughter Salome aſking of Herod the head of John, in reward for her fine dancing, with which he had been ſo highly delighted, as to promiſe her whatever ſhe ſhould demand. John was beheaded; but the ambition of Herodias was not ſatiated. Their relation, Herod AGRIPPA, (ſee the article,) had obtained regal honours from Caligula; ſhe was deſirous of the ſame diſtinction for her huſband, and perſuaded him, much againſt his inclination, to take a journey to Rome for the purpoſe. Here, however, he was accuſed of being concerned in a conſpiracy with Sejanus, and inſtead of returning home a king, he was ſtript of his dominions, and ſent, with his wife, into exile at Lyons, where he probably died, having poſſeſſed his tetrarchy forty-three years. Joſephus, Lardner, New Teſtament.

HERODIAN, a Greek hiſtorian, who flouriſhed from the reign of Commodus to that of the third Gordian, was born at Alexandria, and employed among the officers of the Roman emperors. He wrote a hiſtory of Rome, in eight books, from the death of Marcus Aurelius to Maximinus, and he aſſerts that he had either ſeen or been perſonally acquainted with all that he relates. His ſtyle is ſimple and elegant, but he diſplays, with a capacity and penetration ſuited to his ſubject, no elevation of mind, or general erudition, and a conſiderable want of geographical knowledge. He has been accuſed of being too partial towards Maximinus, and ſevere with regard to Alexander Severus. But Mr. Gibbon paſſed a different judgment on him. "The life of Alexander," ſays he, "in the Auguſtan hiſtory, is the mere idea of a perfect prince, an awkward imitation of the Cyropedia. The account of his reign, as given by Herodian, is rational and moderate, conſiſtent with the general hiſtory of the age, and, in ſome of the moſt invidious particulars, confirmed by the deciſive fragments of Dion. Yet, from a paltry prejudice, the greater number of our modern writers abuſe Herodian, and copy the Auguſtan hiſtory." His book comprehends the hiſtory of nearly 70 years. The beſt edition of this author is "Herodiani Hiſtoria," 4to. Gr. Politiani, Lovan. 1525. This edition is mentioned by Dr. Harwood as exceedingly ſcarce, correct, and truly valuable. Politian publiſhed an elegant tranſlation of this hiſtorian, which was firſt publiſhed in a fol. volume in 1493, and is contained in the Aldine edition, Venet. The Oxford editions of 1699 and 1704, are correct and very beautiful. The moſt erudite and elaborate edition extant is that projected by Leiſner, and after his death in 1767, completed by Irſmich, Lipſ. 8vo. 1789, 1805. Gr. and Lat. 5 vols. Gibbon. Harwood. Dibdin.

HERODIANS, a ſect among the Jews, at the time of Jeſus Chriſt, mentioned by St. Matthew, xxii. 16. and St. Mark, iii. 6. viii. 15, and xii. 13. but paſſed over in ſilence both by Joſephus and Philo.

The critics and commentators on the New Teſtament are very much divided with regard to the Herodians; ſome making them to be a political party, and others a religious ſect. The former opinion is favoured by the author of the Syriac verſion, who calls them the domeſtics of Herod, and alſo by Joſephus's having paſſed them over in ſilence, though he profeſſes to give an account of the ſeveral religious ſects of the Jews. The latter opinion is countenanced by our Lord's caution againſt the leaven of Herod, which implies, that the Herodians were diſtinguiſhed from the other Jews by ſome doctrinal tenets. Mr. Baſnage ſuppoſes, that one thing meant by the leaven of the Herodians might be a conformity to Roman cuſtoms in ſome points which were forbidden the Jews: if this was the caſe, it is not ſtrange that they are not particularly mentioned by Joſephus among the Jewiſh ſects.

St. Jerom, in his Dialogue againſt the Luciferians, takes the name to have been given to ſuch as owned Herod for the Meſſiah: and Tertullian, Epiphanius, Chryſoſtom, and Theophylact, among the ancients; and Grotius, and other moderns, are of the ſame ſentiment. But the ſame St. Jerom, in his comment on St. Matthew, treats this opinion as ridiculous; and indeed it muſt be highly improbable, whether we underſtand it of Herod the Great, who died ſoon after our Saviour was born, or of Herod Antipas, who reigned at the time of his perſonal miniſtry; ſince they were not native Iſraelites; and it cannot be well ſuppoſed, that any Jews were ſo ignorant as to take a foreigner for the Meſſiah, who had been ſo expreſsly promiſed them to be raiſed up among themſelves, of the tribe of Judah, and of the houſe of David. The wicked and odious adminiſtration, and alſo the death of Herod the Great, muſt have convinced the moſt ſtupid of their miſtake; as they perceived that he had been very far from accompliſhing the deliverance of Iſrael from all oppreſſion, which they expected from the Meſſiah. And as for the ſecond Herod, his dominions were ſmall, and his power little, in compariſon with the former; Judea being reduced into the form of a Roman province, ſo that he was little more than the procurator of Galilee, with merely the title of king. It is altogether inconceivable that any ſhould take him for the Meſſiah. St. Jerom maintains, that the Phariſees gave this appellation, by way of deriſion, to Herod's ſoldiers, who paid tribute to the Romans; agreeably to which the Syriac interpreters render the word by the *domeſtics of Herod*: *i. e.* his courtiers.

M. Simon, in his notes on the twenty-ſecond chapter of Matthew, advances a more probable opinion. The name

Herodian

Herodian he imagines to have been given to ſuch as adhered to Herod's party and intereſt, and were for preſerving the government in his family; about which there were, at that time, great diviſions among the Jews.

F. Hardouin will have the Herodians and Sadducees to have been the ſame: nor is it at all improbable, that the Herodians were chiefly of the ſect of the Sadducees; ſince that which is called by St. Mark (viii. 15.) the leaven of Herod, is by St. Matthew (xvi. 6.) ſtyled the leaven of the Sadducees.

Mr. Baſnage, and ſome others, ſuppoſe that they were certain officers of Herod, tetrarch of Galilee, who came up to Jeruſalem at the feaſts, and who were more devoted to the intereſts of the emperor than ſome of the Jews; and, therefore, the Phariſees perſuaded ſome of them to go along with their own diſciples, when they ſent them to our Saviour with the queſtion concerning the lawfulneſs of tribute. The learned Albert Fabricius ſuppoſed, that they were the courtiers and ſoldiers of Herod Antipas, tetrarch of Galilee; and that the name Herodians no more denotes a ſect, than Cæſareans and Pompeians, or any ſuch like name, would do.

Dr. Prideaux is of opinion that they derived their name from Herod the Great, and that they were diſtinguiſhed from the other Jews by their concurrence with Herod's ſcheme of ſubjecting himſelf and his dominions to the Romans, and likewiſe by complying with many of their heathen uſages and cuſtoms.

In their zeal for the Roman authority they were diametrically oppoſite to the Phariſees, who eſteemed it unlawful to ſubmit, or pay taxes, to the Roman emperor; an opinion which they grounded on their being forbidden by the law to ſet a ſtranger over them, who was not one of their own nation, as their king. The conjunction of the Herodians, therefore, with the Phariſees againſt Chriſt, is a memorable proof of the keenneſs of their reſentment and malice againſt him; eſpecially, when we conſider that they united together in propoſing to him an enſnaring queſtion, on a ſubject which was the ground of their mutual diſſenſion; namely, whether it was lawful to pay tribute to Cæſar? And provided he anſwered in the negative, the Herodians would accuſe him of treaſon againſt the ſtate; and ſhould he reply in the affirmative, the Phariſees were as ready to excite the people againſt him, as an enemy to their civil liberties and privileges. Herod had introduced ſeveral heathen idolatrous uſages; for, as Joſephus ſays, (Antiq. lib. xv.) he built a temple to Cæſar, near the head of the river Jordan; he erected a magnificent theatre at Jeruſalem, inſtituted Pagan games, and placed a golden eagle over the gate of the temple of Jehovah (De Bell. Jud. l. i. c. 33.): and as Joſephus elſewhere ſays, (Antiq. l. xv. c. 9.) he furniſhed the temples, which he reared in ſeveral places out of Judea, with images for idolatrous worſhip, in order to ingratiate himſelf with the emperor and the people of Rome; though to the Jews he pretended that he did it againſt his will, and in obedience to the imperial command. The Herodians probably complied with, acquieſced in, or approved theſe idolatrous uſages. This ſymbolizing with idolatry upon views of intereſt and worldly policy, was probably that leaven of Herod, againſt which our Saviour cautioned his diſciples. Prid. Conn. part ii. book v. ſub fin.

HERODICUS, in *Biography*, an ancient phyſician, chiefly celebrated as the inventor of what has been called the gymnaſtic medicine, is ſaid by Plutarch to have been a native of Selymbria, a city of Thrace; but ſome aſſert that he was born in Sicily. He was maſter of a ſchool of exerciſe, or *gymnaſium*, to which the youth reſorted for the purpoſes of learning the military and athletic exerciſes, and obſerving the great improvement of the health connected with them, he turned his attention to the invention of exerciſes for the cure of diſeaſes. Galen conſiders Eſculapius as the author of the gymnaſtic medicine, becauſe he preſcribed the exerciſe of riding on horſeback, and directed certain modes of it for invalids: but Herodicus appears to have been more ſyſtematic in his methods; and deſiſted from teaching the military exerciſes, in order to devote himſelf excluſively to the gymnaſtic medicine, and to aſcertain the regulations of it moſt conducive to its proper end, according to the difference of age, conſtitution, and diſorder of the patient, and to the climate, ſeaſon, &c. Theſe precepts likewiſe included regulations relative to diet and abſtinence; but as the works of Herodicus are loſt, the nature of theſe regulations and precepts is not accurately known. Hippocrates, indeed, has given an opinion reſpecting the practice of Herodicus, which is not very complimentary to his ſkill, "Herodicus," he ſays, "pretending to counteract the fatigue occaſioned by diſeaſe by a fatigue of a different nature, ſometimes brought on inflammations, and ſometimes pains in the ſide, &c. in his patients, and rendered them pale and thin." Plato has alſo ſpoken of Herodicus and his ſyſtem in a ſimilar manner. After ſtating, in one paſſage, that "Herodicus, being of a ſickly habit of body, combined gymnaſtics with medicine, and haraſſed, firſt himſelf, and afterwards many others by the immoderate uſe of exerciſe;" (De Republica, lib. iii.) he expatiates, in another place, upon the dangers and inconveniencies of this plan of treatment, and ſhews to what an abſurd extreme it was often carried by its inventor. To one of his patients, for example, Herodicus preſcribed a pedeſtrian excurſion from Athens to Megara, a diſtance of 180 ſtadia, or upwards of twenty Engliſh miles, but with this expreſs injunction, that when he reached the walls of Megara he ſhould ſtraightway return to Athens. (Plat. Phædr.) In many caſes, however, Hippocrates reſorted to the gymnaſtic medicine; and ſucceeding phyſicians, among whom were Diocles, Praxagoras, Eraſiſtratus, Aſclepiades, &c. have treated of it in a manner which evinces the eſtimation in which it was held by the ancients. Le Clerc. Hiſt. de la Medecine, liv. ii. cap. 8. See EXERCISE.

HERODORUS, the trumpeter of Megara, who, according to Athenæus, had the power of animating the troops of Demetrius ſo much, by ſounding two trumpets at a time, during the ſiege of Argos, as to enable them to move a machine towards the ramparts, which they had in vain attempted to do for ſeveral days before, on account of its enormous weight. Now the whole miraculous part of this exploit may fairly be confined into a ſignal given by the muſician to the ſoldiers for working in concert at the battering ram, or other military engines; for want of which ſignal, in former attempts, their efforts had never been united, and conſequently were ineffectual.

The ſame writer informs us, that Herodorus was victor in the whole circle of ſacred games, having been crowned at the Olympian, Pythian, Nemean, and Iſthmian, by turns.

Theſe performers on the trumpet appear to have been heralds and public criers; who not only gave the ſignals at the games for the combatants to engage, and announced their ſucceſs, but proclaimed peace and war, and founded ſignals of ſacrifice and ſilence, at religious ceremonies.

As Herodorus is allowed to have been cotemporary with Demetrius Poliorcetes, he may be placed about the 120 Olymp. 300 B. C. According to the authors already cited, he was as remarkable for his gigantic figure and enormous appetite, as for the ſtrength of his lungs, which were ſo powerful in blowing the trumpet, that he could not be heard with ſafety unleſs at a great diſtance.

HERODOTUS, the oldeſt of all the Greek hiſtorians whoſe works are extant, and who is called by Cicero "The Father of Hiſtory," was born at Halicarnaſſus, in Caria, in the firſt year of the ſeventy-fourth Olympiad, anſwering to the year 484 B. C. He fled to Samos when his country laboured under the oppreſſions and tyranny exerciſed by Lygdamis, and travelled, in the acquiſition of knowledge, over Greece, Egypt, and Italy, collecting every where all the information he could obtain concerning the hiſtory and origin of nations. He is ſuppoſed to have retired to the iſle of Samos for the compoſition of his work; he afterwards re-viſited his native place, and was chiefly inſtrumental in overthrowing the tyrannical government, a deed, which of itſelf alone ought to have immortalized his name, but ſo far from gaining the eſteem and admiration of the people, it diſpleaſed and irritated them, and Herodotus was obliged to fly from Greece to avoid public reſentment. When he had attained to his thirty-ninth year, a generous deſire of fame led him publicly to recite his hiſtory to the people aſſembled at the Olympic games. It was received with univerſal applauſe, and gave him a laſting celebrity through all the Grecian ſtates. So highly was the hiſtory eſteemed by his contemporaries, that the names of the nine muſes were given unanimouſly to the nine books of which it is compoſed. This celebrated compoſition is written in the Ionic dialect, and Herodotus is among hiſtorians, what Homer is among poets, and Demoſthenes among the orators. His hiſtory comprehends a period of 240 years, from Cyrus the Great to Xerxes, or, if we date its commencement about 713 years B. C. and its termination at the year 479 B. C. it includes a period of about 234 years, and it contains, beſides the tranſactions between Perſia and Greece, a ſketch of the affairs of other nations, as the Lydians, Ionians, Lycians, Egyptians, and Macedonians. Herodotus had written a hiſtory of Aſſyria and Arabia, which is loſt. The life of Homer, generally attributed to him, is ſuppoſed by ſome able critics not to have been written by his pen. Herodotus, as an hiſtorian, is generally thought to be too fond of the marvellous. Many fabulous things are inſerted in his hiſtory, though not without ſufficient intimations of his own diſbelief, or ſuſpicion of them. And it is an argument greatly in favour of this ancient writer, that his chronology requires leſs correction, according to Newton's canons, than that of any ſubſequent Greek hiſtorians. The greateſt inconvenience attending the peruſal of his hiſtory reſults from his method, which is the moſt irregular and diſcurſive that can be conceived; ſome entire hiſtories being introduced, as it were, by way of parentheſis in the bodies of others. Notwithſtanding all his faults, he is a moſt pleaſing writer. The two beſt editions of this work are that of Weſſeling, fol. Amſterdam, 1763, which is now become ſcarce and dear, and that of Glaſgow in 9 vols. 12mo. 1761. The editio princeps is that of Aldus, Venet. fol. 1502, Græc. which, in the opinion of Weſſeling, is very faithful and accurate. It has been tranſlated into moſt modern languages; the Engliſh verſions are thoſe by Littlebury and Beloe. "The ſtyle of Herodotus," ſays one of his biographers, "has always been admired for its flowing eaſe and ſweetneſs. Cicero compared its courſe to that of the waters of a ſtill river. It excels chiefly in narration, and wants force and conciſeneſs for ſentiment and remark. With reſpect to the matter of this hiſtorian, it has been the ſubject of diſcuſſion almoſt ever ſince the firſt appearance of his work, ſome have placed great confidence in his authority, and others regarded him altogether as fabulous. It is certain that he relates many things reſpecting remote times and countries which have all the air of fable; but there is reaſon to believe, according to his own aſſertions, that he gives the narrations as he heard them. With reſpect to thoſe great tranſactions which took place in Greece after his own birth, he is generally thought to be deſerving of credit, and the publication of his work, at a general aſſembly of the nation, is conſidered as a voucher for his veracity. Nevertheleſs, he has been ſuſpected of partiality in particular inſtances, and Plutarch has compoſed an expreſs treatiſe "On the Malignity of Herodotus," in which he taxes him with injuſtice towards the Thebans and Corinthians, and, indeed, towards the Greeks in general. Juvenal alſo alludes to him in his "Velificatus Athos et quicquid Græcia mendax Audet in Hiſtoria." Still his work is juſtly accounted one of the moſt precious relics of antiquity." Gibbon. Lempriere. Gen. Biog. Moreri.

HEROIC, ſomething belonging to a hero or heroine.

Thus we ſay, heroic actions, heroic virtue, heroic ſtyle, heroic verſe, heroic poet, heroic age, &c.

HEROIC *Age* is that age or period of the world, wherein the heroes, or thoſe called by the poets the *children of the gods*, are ſuppoſed to have lived.

The heroic age coincides with the fabulous age. See AGE.

HEROIC *Poem* is that which undertakes to deſcribe ſome extraordinary action, or enterpriſe.

Homer, Virgil, Statius, Lucan, Taſſo, Camoens, Milton, and Voltaire, have compoſed heroic poems.

In this ſenſe, heroic poem coincides with epic poem. See EPIC *Poem* and HERO.

HEROIC *Verſe* is that wherein heroic poems are uſually compoſed; or, it is that proper for ſuch poems. In the Greek and Latin, hexameter verſes are peculiarly denominated heroic verſes, as being alone uſed by Homer, Virgil, &c. Alexandrine verſes of twelve ſyllables were formerly called heroic verſes, as being ſuppoſed the only verſes proper for heroic poetry; but later writers uſe verſes of ten ſyllables.

HEROINE, HEROINA, or *Herois*, a woman that has the qualities and virtue of a hero, or that has done ſome heroic action.

HERON, in *Geography*, a town of France, in the department of the Ourte, and chief place of a canton, in the diſtrict of Huy. The place contains 698, and the canton 7654 inhabitants, on a territory of 137½ kiliometres, in 19 communes.

HERON, in *Ornithology*, a tribe, family, or genus of the Grallæ order, being variouſly applied by different authorities. In a general ſenſe the term heron includes the whole of the ardea genus, the character of which conſiſts in having the bill ſtraight, pointed, long, ſub-compreſſed, with a furrow from the noſtrils towards the tip; and the noſtrils linear; tongue ſharp; feet four-toed and cleft; and the toes connected at the baſe. Theſe are divided by Gmelin into four families, the firſt compriſing thoſe with the head creſted, and the bill hardly longer than the head; the ſecond have the head bald, and are the grues or cranes; the third have the orbits naked, and are the ſtorks; and the laſt, which is by far the moſt extenſive family, comprehends the herons, or thoſe birds of the ardea tribe which have the middle toe ſerrated.

The French adopt the word heron in the ſame manner; they conſider it as including the whole of the ardea genus, which they divide into four families; the *hérons*, properly ſo called, *heron-butors*, *biboreaux*, and *crabiers*. Their true herons compriſe the *aigrettes*, a family diſtinguiſhed by having a very large tuft of fine pendent feathers ariſing from the poſterior part of the body, beneath the tail; but is not confined to that family, as Buffon applies the ſame term to moſt

moſt of the ardea genus. The family of butor, or as ſome French authors denominate them *heron-butors*, are the bitterns, which differ from the herons in having the body thicker, the legs not ſo long, and the tail ſhorter. Thoſe of the *bihoreaux* family are leſs than the bitterns, their tail ſhorter, and have two or three long appendices placed in the nape of the neck, which ſufficiently diſtinguiſh them from the other families; the bill in theſe is ſlightly arched above. The *crabiers* form a ſubaltern family, including thoſe of a ſmall ſize, and hence are ſometimes called the little herons; it is chiefly from their diminutiveneſs they have obtained this appellation.

The manners of the heron tribe are well known; they frequent the fens, and other watery places; and feed on fiſhes, reptiles, and the ſmaller kinds of quadrupeds. They are diſtributed by Gmelin in the following order.

Species.

* *Creſted; Bill hardly longer than the Head.*

PAVONIA. Creſt briſtly, erect, temples with two naked wattles. Gmel. *Pavo marinus*, Cluſ. *Balearica*, Aldr. *Balearic crane*, Ray. *Crowned heron.*

Length two feet nine inches. This ſpecies feeds on worms and vegetables; runs and flies well, and ſleeps on one leg. It inhabits Africa and Guinea.

VIRGO. Behind each eye a tuft of long, white, pendent feathers. Gmel. *Numidian crane*, Albin. *Demoiſelle heron.*

Native of Africa and Aſia. An elegant bird, about three feet three inches in height, with the bill yelloviſh, the baſe greeniſh, and the tip red; the head and primary quill-feathers are black, the latter long and pendulous; creſt pendent backward over the eyes; and the head, neck, throat, breaſt, and legs black.

** *Cranes.* See GRUES.

*** *Storks. Orbits naked.*

CICONIA. White; orbits and quill-feathers black; bill, legs, and ſkin red. Linn. &c. *La cicogne blanche*, Briſſ. *White ſtork*, Ray. Donov. Br. Birds, &c.

A general inhabitant of Europe, Aſia, and Africa; feeds on reptiles and fiſh, and is held ſacred in many countries for its great utility in deſtroying ſerpents; it migrates at particular ſeaſons from one part to another in vaſt flocks, and in the moſt orderly manner. The female makes a large neſt compoſed of ſticks, and lays three or four eggs of a dirty yelloviſh white colour, in ſize like thoſe of the gooſe, but rather more elongated. The ſtork ſleeps on one leg, and ſnaps with its bill in a very ſingular manner, in doing which the head is turned back, and the upper part of the bill placed on the rump. The fleſh of the ſtork is indifferent, and this, in addition to the beneſits derived from its inveterate animoſity towards the reptile race, may in ſome meaſure account for its being allowed to live and even breed unmoleſted in the moſt populous eaſtern cities; the ſame veneration is alſo ſhewn for the ſtork in Holland. In England it is a rare bird, and ſeen only in ſevere winters. The height of this ſpecies is about three feet three inches.

MAGUARI. White; orbits and legs red; bill cinereous; upper part of the tail, and greater wing-coverts, quill-feathers, and ſcapulars black. Gmel *Le maguari*, Buff. *La cigogne d'Amerique*, Briſſ. *Ciconia Americana, American ſtork*, Ray.

Size of the laſt, and inhabits the Brazils, and other warm parts of America.

NIGRA. Brown; breaſt and belly white. Linn. *La cicogne brune*, Briſſ. *Black ſtork*, Ray.

Length two feet nine inches, and inhabits many parts of Europe, but is leſs common than the white ſtork, and migrates to the ſouth in autumn; its haunts are thick foreſts and marſhes in the moſt ſecluded ſituations. Like the white ſtork it feeds on fiſh and reptiles, and the fleſh is equally unpalatable.

*** *Herons, middle Claw ſerrated inwardly.*

DUBIA. Glaucous, beneath dirty-white; bill a little triangular. Gmel. *Argill* or *hargill*, Ives. *Boorong cambing, or Booring-volar*, Marſd. *Gigantic crane*, Lath.

The extraordinary magnitude of this bird renders it the moſt conſpicuous of the heron genus, the tribe to which it appears at leaſt the neareſt allied, if we can form a correct opinion from the deſcriptions Marſden, Ives, and other authors afford us. The height of this bird, when ſtanding erect, is about ſeven feet and a half, and the expanſion from tip to tip of the wing above fourteen feet; the bill is ſixteen inches round at the baſe, of various colours, and nearly triangular; the feathers of the back very ſtrong and of an iron colour; thoſe of the breaſt long; over the belly a great deal of down of a dirty white; the legs and half the thighs naked; and the naked parts full three feet in length. This monſter, as Mr. Ives terms it, inhabits Bengal, and is alſo found at Calcutta, at which latter place it is called hargill, or argill. It ſtalks, he ſays, majeſtically along before one, and appears at firſt like a naked Indian. The common opinion is, that the ſouls of the Bramins poſſeſs theſe birds. On opening one of theſe, a terapin, or land tortoiſe, ten inches long, was found in its craw, and a male black cat was found entire in its ſtomach.

A gigantic bird of this kind, and ſuppoſed to be of the ſame ſpecies, is mentioned by Mr. Smeathman as an inhabitant of Africa; he deſcribes the height of an adult bird, when ſtanding erect, at about ſeven feet; the plumage, according to this writer, agrees with the deſcription of the argill given by Mr. Ives; to which is added that the gape is monſtrouſly wide; the head covered with white down, thinly diſperſed, appearing not unlike a grey-headed man; on the middle of the neck before, a long conic membrane, like a bladder, ſprinkled very thinly with ſhort down riſing or falling as the animal moves the beak, and always appearing inflated. Theſe birds are met with in companies; and when ſeen at a diſtance, near the mouths of rivers, coming towards an obſerver, which they do with their wings extended, may be miſtaken for canoes upon the ſurface of a ſmooth ſea; or, if walking on the ſands, for human beings. One of theſe, a young bird about five feet in height, was brought up tame, and preſented to the chief of the Bananas, where Mr. Smeathman lived; and being accuſtomed to be fed in the great hall, ſoon became familiar, duly attending that place at dinner-time, placing itſelf behind its maſter's chair frequently before any of the guests entered. The ſervants were obliged to watch it narrowly, and to defend the proviſions with ſwitches in their hands; but notwithſtanding this, it would frequently ſnatch off ſome part of the proviſions, and was once known to have purloined a whole boiled fowl, which it ſwallowed in an inſtant. Its courage is not equal to its voracity; for a child of eight or ten years old could ſoon put it to flight with a ſwitch; though at firſt it ſeems to ſtand on its defence by threatening with its enormous bill, widely extended, and crying out with a loud hoarſe voice, like a bear or tiger. It is an enemy to ſmall quadrupeds as well as birds and reptiles, and deſtroys fowls and chickens, though it dare not attack a hen with her young openly; it preys alſo on rats, young chickens, and the like, and has been known to ſwallow a cat whole; a ſhin bone of beef being broken aſunder, ſerved it but for two

two morſels. The individual above-mentioned uſed to fly about the iſland, and rooſt very high among the ſilk cotton trees; from whence, at two or three yards diſtance, it could ſpy the ſervants carrying the dinner acroſs the yard; when darting from its ſtation it would enter promiſcuouſly with the women who carried in the diſhes. In ſitting it was obſerved to reſt itſelf upon the whole length of the hind part of the leg. It ſometimes ſtood near for half an hour after dinner, with the head turning alternately; as if liſtening to the converſation; and during this time would every three or four minutes mute firſt on one leg, and then on the other; obſerving invariably, that if he had muted on the left leg laſt, he would be ſure to do the ſame on the right the next time, never making any miſtake.

Torquata. Hind head black, creſted; back brown; neck and belly dirty white; breaſt black; with yellowiſh lunules. Gmel. *Wreathed heron.*

Native of South America.

Nycticorax. Creſt on the hind head white, horizontal, and conſiſting of three feathers; back black; abdomen yellowiſh, Scop. male. *Ardea griſea.* Head ſmooth, brown; belly browniſh, beneath white; firſt quill-feathers with a white ſpot at the tip. Linn. female. *Ardea varia,* Klein. *Nitticorace,* Cetti. *Le Bihoreau,* Buff. *Night heron,* Ray. Donov. Br. Birds, &c.

The length of this elegant ſpecies is about twenty inches, the male being about the ſame ſize as the female. The bill is ſtout, about three inches and three quarters long, the baſe yellow, and the extremity black. The prevailing colour of the plumage in the male is grey above, beneath pure white; the head, as far as the middle of the back, dark gloſſy green; the creſt of three long diſtinct pendent feathers; and the legs greeniſh. In the female, (which Linnæus conſidered a different ſpecies,) the crown is brown, and without creſt; the body grey-brown; the neck beneath with a ruſty line; lores white; tail feathers edged with white, and the legs brown. The ſpecies is an inhabitant of ſome parts of Europe and America. "It is recorded by Dr. Latham, and later writers, as a native of Britain, upon the authority of an individual example of the male bird ſhot near London in the month of May 1782, and which at this time is in our poſſeſſion." Donov. Br. Birds.—The Germans call it Nachtrab, or Night Raven; and the Ruſſians Kwaka, from its cry, which reſembles that word uncouthly expreſſed.

Jamaicensis. Brown, beneath white; head ſomewhat creſted; breaſt and belly with browniſh ſtreaks. Gmel. *Jamaica night heron,* Lath.

About the ſize of the laſt, or ſcarcely larger; the bill duſky; lores and orbits greeniſh; chin and vent white; primary quill-feathers black at the tip; legs brown. This kind is known by the name of the Clucking Hen in the Weſt Indies, where, contrary to the uſual manners of the heron tribe, it frequents woods. In Ind. Orn. (Lath.) it is conſidered, not, perhaps, diſtinct from the female of the former.

Caledonica. Ferruginous, beneath white; creſt on the hind head of three feathers; frontlet black; eye-brows white. Gmel. *Caledonian white heron,* Lath. Cook's Voyage, &c.

Native of New South Wales. Length twenty-two inches; bill ſtraight and black; creſt feathers white; area of the eyes green; legs yellow.

Obscura. Creſt on the hind head one feather; body above greeniſh, beneath cheſnut, longitudinally ſtriped, with white and ferruginous; quill feathers with a white ſpot at the tip. It. Poſeg. *Duſky heron.*

Size of the common bittern; the bill recurved, greeniſh-black; feathers of the creſt white; front, crown, and nape duſky cheſnut; back and wing-coverts duſky cheſnut and golden green; legs ſhort and greeniſh. Inhabits Sclavonia.

Cayanensis. Cinereous; head black; crown white; creſt unequal, of ſix feathers, half white, the remainder black. Gmel. *Le biboreau de Cayenne,* Buff. *Cayenne night heron,* Lath.

Length twenty-one inches; the bill black; lores pale-green; a white line from the noſtrils beneath the eyes to the hind head; body blueiſh-aſh; quill-feathers black; legs yellowiſh and long, the thighs bare high up. This ſpecies inhabits Cayenne.

Purpurea. Hind head black; creſt pendent, of two long feathers; body olive; beneath purpliſh. Gmel. *Ardea criſtata, purpuraſcens,* Briſſ. *Heron pourpré,* Buff. *Creſted purple heron,* Lath.

Rather leſs than the common heron; the length two feet ten inches and a half; bill ſix inches long, brown, with a duſky point, and yellowiſh beneath; head furniſhed with a black creſt; orbits naked, and yellowiſh; chin white; upper half of the neck rufous, with three black lines diſpoſed longitudinally, the colour behind olive, at the ſides rufous, and in front reddiſh; from the breaſt in the middle, to the vent a black band; lower tail-coverts white varied with rufous, and tipped with black; angles of the wings rufous; quill-feathers dark; tail cinereous olive; legs greeniſh with duſky claws. This ſpecies inhabits Aſia, frequenting the lakes of the Caſpian and Black ſeas, and thoſe of Great Tartary, but is not found farther eaſt in Siberia than the river Irtiſh.

Purpurata. Head without creſt, and with the neck blackiſh cinereous; body above purple-cheſnut, beneath cinereous. *Ardea purpurata,* Gmel. *A. purpuraſcens,* Briſſ. *Heron pourpré,* Buff. *Purple heron,* Lath.

Size of the common heron. The upper mandible yellowiſh-green, lower yellowiſh; face naked and yellowiſh; neck lineated above with black; quill-feathers blackiſh-brown; legs brown. Inhabits the banks of the Danube. Some late ornithologiſts, according with Buffon, believe this to be the female of the former; others are perſuaded it is ſpecifically different.

Caspica. Creſted; body cinereous; neck, breaſt, and belly ferruginous; chin white; neck with three black lines. Lath. Ind. Orn. *Ardea caſpica,* Gmel. Reiſe. *Ardea ritula,* Lath. Suppl. *African heron.*

This beautiful ſpecies is the ſize of the common heron; the length being nearly three feet; the bill ſeven inches long, of a yellowiſh colour, with the tip black; the creſt long, and conſiſting of three feathers; the legs are dull yellow, with the anterior part of the toes, together with the claws, black.—"A bird of this very rare kind was ſhot ſome years ago in Aſhdown park, near Lambourn, Berks; and it is on the authority of this ſpecimen the ſpecies is arranged among the birds of this country. The ſpecimen is deſcribed by Dr. Latham in the ſupplement of his Ornithology, under the ſpecific name of ritula, and afterwards in his "Index Ornithologicus," with the obſervation "rariſſima in Anglia," under that of Caſpica. The original bird depoſited formerly in the Leverian collection, is now in the muſeum of the author." Vide Donov. Br. Birds. Whether this be really a diſtinct ſpecies from the former (ardea purpurea), or only a variety, admits of ſome diſpute. Dr. Latham, in the lateſt of the works laſt mentioned, deſcribes it a diſtinct bird, with a ſuggeſtion of doubt, "vix a præcedente ſatis diſtincta. Nonne avis annotina?" Monſ. Viellot, author of the continuation of Audebert's "Hiſtoire des Oiſeaux," without, however, appearing to have conſulted the original, offers a more poſitive opinion, and conſidered it the ſame as the

purple

purple heron; at the ſame time blaming the author before-mentioned for his ſeeming contradiction, in deſcribing it as a ſpecies, while he ſtill eſteemed it only a young bird of the former kind. "L'Ornithologiſte Anglais, (ſays Viellot,) qui a décrit *le heron de la mer Caſpienne*, attribue au jeune âge les foibles différences qui exiſtent entre lui et le *heron pourpré*; cependant il le donne comme eſpèce diſtincte; mais on doit le rapporter à celle du heron pourpré." This interpretation of Dr. Latham's remarks is more abſolute than the paſſages to which he alludes will juſtify, for theſe expreſs only a moderate ſhare of doubt; nor can we refrain from adding, that from a ſubſequent attentive examination of the ſpecimen in our poſſeſſion, we are inclined to think the concluſion drawn by Viellot is erroneous, for we really conceive it to be an adult bird, and very probably a diſtinct ſpecies.

Major. Hind head with a long pendent creſt; body cinereous; line on the neck beneath, and pectoral bar black. Male.—Hind head ſmooth, black; back blueiſh, beneath whitiſh; breaſt with oblong black ſpots. Female.

Mas. *Ardea major*, Linn. *Ardea criſtata*, Briſ. *Garza cinerizia groſſa*, Zinnen. *Le heron huppé*, Buff. *Creſted heron*, Alb. *Common heron* (male), Donov. Br. Birds.

Femina. *Ardea cinerea*, Linn. *Ardea rhenana*, Naturf. *Heron*, Buff. *Common heron* (female), Donov. Br. Birds.

The length of this bird is about three feet; its breadth, when the wings are expanded, above five feet; and the weight exceeding three pounds. The heron is very common in Britain, and is ſo generally diffuſed, that there is ſcarcely any part of the globe that has been viſited by travellers, in which it has not been noticed. Its haunts, like moſt of its tribe, are fenny places, where it preys on fiſhes and reptiles, and from the voracity of its appetite is highly deſtructive in fiſh-ponds. In flying the heron ſoars to a vaſt height, having the head crouched in between the ſhoulders, and the legs pendulous. During the breeding ſeaſon the herons unite in large ſocieties; the neſt is compoſed of ſticks lined with ruſhes, wool, feathers, and other light ſubſtances, and generally contains from four to ſix eggs, which are of a pale-greeniſh blue colour. The neſts of theſe birds, which they deſert in the winter, are often found drifted upon the banks of rivers at that ſeaſon of the year. In Britain the heron was formerly held in high eſtimation, its fleſh being accounted a delicacy at the tables of the nobility, and bearing a price equal to that of the pheaſant and the curlew. Heron hawking was alſo a favourite diverſion, inſomuch that laws were enacted for the preſervation of the ſpecies; and any perſon found guilty even of deſtroying their eggs, was condemned to pay the penalty of twenty ſhillings each, a heavy ſum in the times when thoſe laws were in force.

Egretta. Somewhat creſted; white; legs black; feathers of the back and breaſt lax, narrow, and very long. Gmel. *Guiratinga*, Ray. *Great egret*. Arct. Zool.

Length two feet, the creſt ſcarcely viſible; bill black, or dirty yellow, and duſky at the back and tip. A native of South America. It is a ſhy and ſolitary bird, and frequents marſhes, where it ſecretes itſelf among the reeds in the day time, and feeds at night.

Garzetta. Hind-head creſted; body white; bill black; lores and legs greeniſh, Kramer. *Ardea alba minor*, Aldr. *Gerzetta*, Geſn. *Egretta*, Belon, &c. *Aigrette*, Buff. *Little egret*, Donov. Br. Birds.

The creſt of this elegant bird conſiſts of ſeveral ſhort and two longer feathers; the face is naked, and green; and the claws black. The ſpecies inhabits marſhes in temperate regions. Formerly the egret appears to have been common in Britain; at this time it is very rare. The ſize of this kind is half that of the great egret, or about twelve inches.

Leucogaster. Blueiſh-black, beneath white; creſt on the hind-head of two feathers; bill, naked face and legs yellow. Gmel. *Demi-aigrette*, Buff. *Demi-egret*.

Length not quite two feet; lower part of the back with ſome pendulous feathers, of an elongated form and rufous colour. Native of Cayenne.

Rufescens. Blackiſh grey; lores and orbits green; feathers of the head and neck, and longer narrow ones of the back ferruginous rufous, Gmel. *Aigrette rouſſe*, Buff. *Reddiſh aigrette*, Arct. Zool.

Native of Louiſiana. Length two feet; bill yellowiſh, with duſky tip; legs black.

Agami. Black-blue, beneath rufous; hind head creſted; orbits and chin white. Gmel. *Agami*, Buff. *Agami heron*.

Length two feet ſeven inches; the bill duſky; cap and creſt blue, the latter compoſed of ſix feathers; lower part of the neck and back with ſix long pendulous feathers. This ſpecies inhabits Cayenne.

Cocoi. Hind head, pendent creſt, and back cinereous; neck beneath ſpotted with black; ſides of the head black. Gmel. *Ardea cayanenſis criſtata*, Briſſ. *Ardea ſecunda*, Tetr. *Cocoi*, Marcgr. *Blue heron*, Albin. *Cocoi heron*.

Inhabits Brazil and Cayenne. The length of this bird is three feet; the bill greeniſh-yellow; body cinereous; creſt five inches and a half long; cheeks, chin, and crown white; neck and back with very long pendulous feathers. This ſpecies is ſaid to be fat and tolerably good eating in the rainy ſeaſon.

Johanna. Above cinereous, beneath white; pendent creſt, and quill-feathers black; feathers of the throat long, lax, and ſpotted with black. Gmel. *Johanna heron*, Lath.

Size uncertain; the bill yellowiſh; face naked, yellowiſh-green; legs browniſh. Deſcribed by Dr. Latham from ſome Chineſe drawings formerly in the poſſeſſion of Dr. Fothergill.

Fusca. Creſt blackiſh; body blackiſh-brown, beneath white; breaſt with long brown ſpots. Lath. *Le heron brun*, Buff.

Length two feet and a half; the bill brown; legs yellow. The ſpecies inhabits Cayenne.

Hoactli. Creſted; head and body above black; beneath white; face naked and yellowiſh; front between the eyes white; wings and tail cinereous. Gmel. *Ardea mexicana criſtata*, Briſſ. *Hoäli*, Buff. *Hoactli*, or *Dry heron*, Lath. *Hoactli bird*, Ray. *Hoaclon*, Will. *Dry heron*, Lath. *Hoactli heron*.

Inhabits Mexico, where it frequents lakes, and breeds among the ruſhes. The Spaniards call it *Martinete Peſcador*, as it is imagined from its catching fiſh; its voice is loud and flat, the bite hard. It is a large bird, being three feet three inches long: the bill black with the ſides yellow. The plumage of the female differs from the male in being brown mixed with whitiſh above; beneath white tinged with brown.

Hohu. Head purple and creſted; body cinereous; angles of the wing-coverts white; front varied black and white; wing-coverts blue and cinereous. Gmel. *Ardea mexicana cinerea*, Briſſ. *Xouckqui hoactli*, Ray. *Houhou*, Buff. *Hohou heron*.

A rare ſpecies, ſometimes found in the fens of Mexico. Buffon calls it houhou from its cry reſembling the pronunciation of that word. The bill is black; legs variegated with

with brown, black and yellowiſh; creſt purple and compoſed of ſeven feathers.

Indica. Varied with brown and green; ſecondary quill-feathers green; tail black; wing-coverts, primary quill-feathers and body beneath white. Lath. *Lohaujung heron.*

Length three feet; the bill black; legs fleſh-colour; crown, neck, and poſterior part of the back with green ſpots. Sometimes the back white. An Indian ſpecies.

Flavicollis. Creſt on the hind head and body black; neck yellowiſh at the ſides, in front cheſnut, the feathers edged with black and white. Lath. *Yellow-necked heron.*

Native of India; the length two feet.

Novæ Hollandiæ. Somewhat creſted; lead-colour cinereous; beneath ferruginous rufous; face beyond the eyes, with the chin and throat, white. Lath. *White fronted heron*, Phillips.

Length twenty-eight inches; the bill black, at the baſe beneath yellowiſh; legs yellow brown. Native of New Holland.

Ludoviciana. Head and neck rufous; front white, ſpotted with rufous; crown creſted; wing-coverts and tail green; back cinereous, tinged with purple. Gmel. *Crabrier de la Louiſiane*, Buff. *Louiſiana heron*, Arct. Zool.

Inhabits Louiſiana; length ſixteen inches; bill duſky; legs yellow; claws black.

Violacea. Hind head pale yellow; creſt white; body ſtreaked black and white; beneath blueiſh; legs pale yellow. Gmel. *Ardea cærulea*, Rai. *Cancrophagus bahamenſis*, Briſſ. *Crabrier gris-de-fer*, Buff. *Grey creſted gaulding*, Brown. *Creſted bittern*, Cateſby. *Yellow-crowned heron*, Arct. Zool.

Length fifteen inches and a half; the bill black; face naked and green; creſt in general about ſix inches long; head violet: from the angle of the mouth each ſide to the hind head a white ſtreak; quill-feathers blueiſh-brown; tail brown. This ſpecies inhabits the Bahama iſlands, where it breeds in the buſhes among the rocks, and being conſidered good eating, the birds are caught in great numbers for the table; in the rainy ſeaſon they viſit Carolina.

Cerulea. Hind head creſted; body blue. Gmel. *Cancrophagus cæruleus*, Briſſ. *Black* or *blue gaulding*, Ray. *Blue bittern*, Cateſby. *Blue heron*, Arct. Zool.

Size of the crow; in the male the bill and lores are blue, and the legs green; in the female the head and neck are duſky purple; chin and middle of the throat white; and the back lead-colour. It is found in Carolina during ſpring after paſſing the winter in Jamaica, and other Weſt Indian iſlands; the ſpecies extends to Otaheite and other iſlands in the South Seas, where the inhabitants treat it with reſpect. Another variety inhabits Queen Charlotte's ſound, where it is called Matook; the head of this is ſomewhat creſted, blue-green, and the chin and throat white; the length eighteen inches. There are other ſuppoſed varieties, the moſt diſtinct of which has the plumage varied with brown, yellow, and cinereous; the colour above ſteel black, beneath white; wings and tail greeniſh. This laſt kind inhabits South America.

Cærulescens. Creſted; body duſky blue; head and neck rufous brown; hind part of the head with two long feathers. Lath. *Le crabier bleu a cou brun*, Buff. *Heron bleuatre de Cayenne*, ib. *Blueiſh heron.*

Conſidered by ſome a variety of the former; the length nineteen inches; bill pale yellow; lores red; legs brown. Native of Cayenne.

Rubiginosa. Ferruginous, beneath whitiſh with black ſtreaks; head ſomewhat creſted; chin white; back with a few black ſpots. Lath. *Ruſty crowned heron*, Arct. Zool.

Size of the common bittern; the bill ſlender; irides and legs yellow; front and quill-feathers duſky; throat with four black ſtreaks; feathers of the breaſt long and looſe; from the breaſt to the upper part of the neck a black line; tail ſhort and lead-coloured. Native of North America.

Herodias. Hind-head creſted; body brown; thighs rufous; breaſt with oblong black ſpots. Gmel. *Ardea virginiana criſtata*, Briſſ. *Larger creſted heron*, Cateſby. *Great heron*, Arct. Zool.

Inhabits the lakes and rivers of Virginia, and feeds on lizards, frogs, and fiſhes; the bill brown; face yellowiſh; creſt and quill-feathers black; neck and breaſt rufous. Length five feet.

Hudsonias. Crown creſted and black; body browniſh, beneath whitiſh; neck ſpotted with reddiſh black. Gmel. *Ardea freti Hudſonis*, Briſſ. *Heron de la Baye de Hudſon*, Buff. *Aſh-coloured heron from North America*, Edw. *Red ſhouldered heron*, Arct. Zool.

Suppoſed by ſome writers to be the female of the laſt ſpecies. Frequents North America from New York to Hudſon's bay, and reſorts to the inland lakes of the latter during ſummer.

Comata. Ferruginous, beneath white; hind head with a long, white, pendent creſt, edged with black. Pallas. *Cancrophagus luteus*, Briſſ. *Guacco*, Buff. *Crabrier de Mahon*, Buff. *Squacco*, Ray.

Native of Aſia and Europe, and has been once ſhot in England. (Linn. Tranſ.) There are ſeveral varieties of this ſpecies.

Erythrocephala. Hind head with a red pendent creſt; body white. Molina.

Inhabits Chili.

Cyanocephala. Hind head creſted, and with the back blue; wings black, edged with white. Molina. *Blue-headed heron.*

Native of Chili; the bill black; belly yellowiſh green; tail green; legs yellow.

Thula. Hind head creſted, and with the reſt of the body white. Molina. *Thula heron.*

Found in Chili.

Candidissima. Snowy-white; bill and legs blackiſh; eyes and toes yellow; creſt very long, and ſhading the hind head, neck, breaſt, and back. Jacquin. *Snowy heron.*

Inhabits near Carthagena in America; ſize leſs than the common bittern.

Castanea. Cheſnut, beneath white; face and eyebrows green; pouched chin and rump white; head creſted. Gmel. *Ardea ralloides*, Scop. *Cheſnut heron.*

Length twenty inches; the bill livid at the baſe and brown at the tip; ſides of the head yellowiſh; neck yellowiſh-bay, beneath varied yellow and whitiſh; quill and tail-feathers ſnowy; wing-coverts ochrey; legs ſaffron; claws black. Inhabits near the Tanais, extending thence from the Black ſea and Arabia. It builds in trees, and is by ſome conſidered as a variety, or perhaps a ſexual difference of the ſquacco heron, Ardea comata.

Squajotta. Bay; creſt on the head black, the middle feathers white; ſcapulars long, narrow, and white at the baſe. Gmel. *Cancrophagus*, Briſſ. *Crabrier cajot*, Buff. *Squajotta*, Ray.

Native of Italy, about Bologna, where it is called ſquaiotta; the length is 18 inches; bill yellow, tipped with black;

black; face yellow and naked; creft with thirty feathers; legs green.

GALEATA. Hind-head fomewhat crefted; body milk-white; bill pale yellow; legs fcarlet. Molina. *Galeated heron.*

Height two feet feven inches; bill four inches long. A native of Chili.

FERRUGINEA. Head fomewhat crefted; body blackifh, the feathers ferruginous at the tips; beneath varied with ferruginous, whitifh, brown, and cinereous. Gmel.

Native of Afia and Europe, and is moft frequent about the river Don in fummer, paffing the winter in the neighbourhood of the Black fea. The fpecies feeds on fifhes and infects, and builds on the top branches of trees. The bill is brown above; beneath reddifh-green; face naked and green; chin pale ochre; quill-feathers black brown, at the tip white; legs greenifh.

ERYTHROPUS. Head crefted; body chefnut-faffron, beneath deeper; bill blue; legs red. Lath. *Cancrofagus rufus*, Briff. *Ardea hæmatopus, feu cirris*, Ray. *Le crabier marron*, Buff. *Red-legged heron.*

Inhabits about Bologna in Italy; the bill black; head varied with yellow and black. Size of the green heron. A fuppofed variety has the fides of the neck fpotted, and the legs pale yellowifh.

STRIATA. Hind-head fomewhat crefted; back hoary and ftreaked; neck beneath ferruginous; fecondary quill-feathers white at the tip. Gmel. *Heron of Guiana*, Bancroft. *Striated heron.*

Defcribed by Bancroft as a native of Guiana; its fize equal to that of the common heron; the bill ftraight, compreffed, and furrowed on the fides. The fpecies alfo inhabits Surinam; and is faid to be feen at Aftrachan about March.

VIRESCENS. Hind head fomewhat crefted; back fhining green; breaft reddifh; lores pale yellow; tail-feathers gold-green (male). Brown gold-green, beneath whitifh; neck reddifh, ftreaked with white; wing-coverts and quill-feathers fpotted with white (female). *Ardea virefcens*, Linn. *Cancrofagus viridis*, Briff. *Le crabier verd*, Buff. *Small bittern*, Catefby. *Green bittern.*

Size of the common hen, the length 18 inches; bill greenifh brown; legs greenifh. It inhabits New York and other pars of North America, extending thence to the iflands in the Weft Indian feas. The fpecies is fuppofed to breed in Carolina, where it is found only in the fummer. It feeds on fifhes of the fmaller fize, and alfo on reptiles and crabs; and, in allufion to the latter, is fometimes called the crab-catcher.

They differ a little in fize, and there appear to be two or three very diftinct varieties. One of thefe, *le crabier de Cayenne* of Buffon, has the plumage cinereous; the head crefted; anterior part of the neck white, with rufous ftreaks; wing-coverts greenifh, edged with rufous; and the crown and tail black. Its fize and habits like the former. Another, called by Klein Ardea fufca, and by Latham the brown bittern, is rather larger, being 20 inches in length; the general plumage is brown, beneath paler; the wings dotted with white; and the quill and tail-feathers blueifh-afh.

BOTAURUS. Head crefted, body cinereous brown above, beneath rufous; crown black; chin and throat white, ftriated with black and reddifh. *Ardea botaurus*, Gmel. *Botaurus major*, Briff. *Ardea ftellaris major, feu rubra*, Ray. *Grand butor*, Buff. *Greater bittern*, Lath.

Native of Italy. The length three feet nine inches. The lores and naked orbits yellowifh; feathers of the head and neck long and flowing.

STELLARIS. Head rather fmooth; body above teftaceous, with tranverfe fpots, beneath pale, with oblong brown fpots. Linn. *Ardea ftellaris minor*, Bell. *Botaurus*, Briff. *Butor*, Buff. *Bittour* or *bittern*, Ray, &c. *Common bittern*, Donov. Br. Birds.

Rather lefs than the common heron; the bill brown, beneath inclining to green; the plumage ferruginous yellow, very beautifully variegated with numerous bars, ftreaks, and ziz-zag lines of black; the legs pale green; claws long and flender. The bittern is an inhabitant of the temperate parts of Europe, Afia, and America, migrating northerly in the fummer, but in fome countries, as in Britain, remaining throughout the year. Its haunts are fens and marfhy places, where it conceals itfelf among the reeds in the day time. About funfet it quits its hiding-place, and commences its flight, foaring, with a prodigious noife, to a vaft height, in a fpiral direction. The food of the bittern conffts principally of fifhes, reptiles, and the fmaller kind of quadrupeds, particularly mice; and in general it fwallows its prey entire. It builds its neft in April among the reeds; the female lays four or five eggs of a pale greenifh afh-colour; and the young are hatched in 25 days. The flefh was formerly efteemed equally with that of the pheafant. A fmaller bird of this kind occurs in Hudfon's bay, the bill of which is longer, and the colour of the plumage in general darker. The natives, by whom it is confidered delicious, call it *Mudebofee*.

SOLONNIENSIS. Crown black; head fmooth, and, with the neck, ferruginous; body above blackifh, beneath reddifh. Gmel. *Botaurus rufus*, Briff. *Butor roux*, Buff. *Rufous bittern.*

Native of Italy; the bill blackifh, beneath horny; wing-coverts varied with ferruginous and white; greater quill-feathers blackifh, leffer ferruginous; legs brown. Lefs than the common bittern.

MARSIGLI. Rufous ftreaked with brown; head fmooth, throat white; quill-feathers browniffh with dufky bars; tail whitifh. Gmel. *Botaurus minor*, Briff. *Petit butor*, Buff. *Swabian bittern.*

Rather fmaller than the laft, and inhabits the Danube.

DANUBIALIS. Brown, with black and reddifh lines; head fmooth; lores naked, yellow; throat and breaft whitifh. Gmel. *Botaurus ftriatus*, Briff. *Butor brunraye*, Buff. *Rayed bittern.*

Size of the laft, and inhabits the fame places; the bill is brown, beneath yellowifh; and the legs and claws grey.

BRASILIENSIS. Head fmooth; body blackifh, dotted with yellow; quill and tail-feathers, with the bill and legs, blackifh. Gmel. *Ardea Braffilienfis*, Briff. *Soco*, Marcgr. *Onoré des bois*, Buff. *Clucking hen*, Brown. *Braffilian bittern*, Brown.

Native of Brazil; the length two feet three inches; head and neck brown, with a few black fpots; throat white, with black and brown longitudinal fpots.

UNDULATA. Reddifh-grey; cap black; body above with black waves, beneath with angular ftreaks. Gmel. *Petit butor de Cayenne*, Buff. *Zig-zag bittern*, Lath.

Length 13 inches; the bill brown; lores blueifh; neck tumid; legs yellow. Native of Cayenne.

TIGRINA. Head fmooth; crown and tail black, with white bands; body black, fpotted above with rufous, beneath with pale ochre; chin and vent white. Gmel. *Onoré*, Buff. *Heron tigré*, Fermin. *Tiger bittern*, Lath.

Native of South America; length two feet and a half; the bill greenifh; chin and fides of the neck reddifh with black fpots; tail with four bands; legs green. This fpecies is not very unfrequent; it lays feven or eight rounded eggs, of a whitifh colour fpotted with green, on the ground, with

out making a neſt. Like the common bittern it frequents marſhes, and ſecretes itſelf among the reeds in the day-time.

Lineata. Head ſmooth; bill and lores blue; wings and tail black; body above waved with rufous, yellowiſh, and brown lines; beneath dirty white. Gmel. *Onoré raye*, Buff. *Lineated bittern*, Lath.

Inhabits South America; the length two feet and a quarter; head and neck rufous, with numerous brown lines croſſing each other; on the anterior part of the neck a white line, each ſide edged with black ſpots; legs yellow. This ſpecies frequents the banks of rivers, where it preys on fiſhes and reptiles. It is ſaid, like the common bittern, to make a vigorous defence when wounded, and to ſtrike its enemy with advantage, eſpecially aiming at the eyes. One of theſe kept tame, as is related, was of ſingular utility in deſtroying rats, watching them with all the attention of the houſe-cat, and even with better ſucceſs.

Flava. Streaked; above brown, beneath white; head and neck reddiſh; tail-feathers with tranſverſe white ſtreaks. Gmel. *Butor jaune du Breſil*, Buff. *Braſilian bittern, with a ſerrated bill*, Will. *Yellow bittern*.

Size of a duck, the length two feet three inches; bill ſerrated near the tip, brown, and at the baſe greeniſh; irides golden; feathers of the belly edged with yellow; tail lineated with white; legs duſky-grey. The ſpecies inhabits Braſil, and is eſteemed good eating.

Bononiensis. Black; collar white; legs with two ſpots on the yellow bill black. Gmel. *Ardea nigra torquata*, Briſſ. *Ardea rougeter*, Raj. *Collared heron*.

Size of the curlew; inhabits Bononia.

Alba. Head ſmooth; body white; bill tawny; legs black. Linn. *Ardea alba*, Geſn. *Ardea alba major*, Marſd. *Great white gaulding*, Sloane. *Great white heron*.

Length three feet ſix inches; the bill ſix inches long; irides yellowiſh; and lores green. Plumage in general white. Inhabits Europe, Aſia, and America.

Pileata. Hind-head creſted; body white; crown black. Lath. *Le heron blanc à calotte noire*. Buff. *Ardea braſilienſis candida*, Briſſ. *Black creſted white heron*.

Size of the laſt, and inhabits marſhes in Guiana; the bill brown; legs pale yellow; lores grey green. This is a rare ſpecies.

Nivea. Head ſmooth; bill and legs black; body ſnowy; feathers of the neck and back flowing. Gmel. *Snowy heron*.

Builds in high trees in Aſia; found about the river Don in ſummer, and paſſing the winter near the Black ſea. The bird, called by Gmelin Ardea xanthedactylos, is ſuppoſed to be a variety. The ſize of theſe herons is about two feet, the male rather exceeding the female; the feathers on the neck and breaſt are rather ſhorter.

Hellas. Head ferruginous; body above black, waved with tranſverſe ferruginous lines; beneath whitiſh; quill and tail-feathers with ferruginous bars. Pallas. *Petit paon des roſeaux de Cayenne*, Rozier. *Oiſeau du ſoleil*, Fermin. *Caurale ou petit paon des roſes*, Buff. *Caurale ſnipe*.

Length ſixteen inches; the bill blackiſh; tongue very narrow and grooved; head and beginning of the neck black with white ſtreaks; rump with tranſverſe lines of white; the ſeven tail-coverts with a large ſpot each at the tip; tail blackiſh, ſtreaked with white, and two ferruginous bands. This curious ſpecies lives on fiſhes and inſects, inhabits the marſhes of South America, and expands the tail like a peacock.

Sacra. Head ſmooth; body white; inner wing-coverts and tail-feathers with black lines; dorſal feathers jagged and white. Lath. *Sacred heron*.

Inhabits Otaheite and the neighbouring iſles, where it is held ſacred. The length is about two feet three inches; the general colour of the plumage white; the bill four inches long and browniſh. On the middle of the crown a few duſky feathers; the legs pale yellow. A ſuppoſed variety of this bird has the crown white, the body variegated white and black; dorſal feathers jagged and black, and the legs black.

Atra. Entirely black; face naked; head ſmooth. Gmel. *Ardea nigra*, Briſſ. *Héron noir*, Buff. *Black heron*.

Size of the common heron, and inhabits Sileſia.

Purpurata. Head ſmooth; crown and neck blackiſh-aſh; body above purple-bay; beneath cinereous; face naked and yellowiſh.

Spadicea. Purple-bay; wings, tail, and ſmooth head bay; crown black. Gmel. *Ardea mexicana purpuraſcens*, Briſſ. *Mexican heron*.

Length twelve inches. This kind inhabits New Spain.

Æquinoctialis. Head ſmooth; body white; two firſt quill-feathers brown on the outer edge. Gmel. *Ardea Carolinienſis candida*, Briſſ. *Crabier blanc à bec rouge*, Buff. *Little white heron*.

Native of America; length eighteen inches, the bill and lores red; irides yellow; legs green. A variety is found in Italy, the crown and breaſt of which are ſaffron; and the lores and legs pale yellowiſh. Another occurs in Mexico, the lores of which are pale yellow; the bill purple; and the legs pale purple.

Cracra. Head ſmooth; body variegated with reddiſh; above blueiſh-aſh; beneath cinereous; neck beneath and breaſt white. Gmel. *Cancrophagus Americanus*, Briſſ. *Cracra*, Buff.

Inhabits near the banks of rivers in Chili and other parts of South America. By ſome it is called cra-cra from its cry when in flight; the natives call it Jaboutre. The bill is black, beneath yellowiſh brown; orbits naked and yellowiſh; hind head and neck above brown, mixed with yellowiſh; leſſer wing-coverts green, edged with rufous, the greater and quill-feathers edged with white; legs yellowiſh.

Leucocephala. Black-violet; crown ſmooth and black; reſt of the head, neck, and vent white. Gmel. *Violet heron*.

Length thirty-three inches. Inhabits Coromandel.

Rufa. Black; head ſmooth; temples ferruginous; breaſt rufous; lower part of the neck whitiſh, with longitudinal browniſh ſpots; upper part, back, and wings brownaſh. Scopoli. *Rufous heron*.

Native of Auſtria. Size of the common heron; from each eye to the hind head a black ſtreak; legs brown.

Sinensis. Brown with pale bars; head ſmooth; wings and tail black. Gmel. *Chineſe heron*.

A ſmall ſpecies found in China.

Virgata. Blackiſh-brown; neck beneath white; throat ſtreaked with black; wing-coverts ſtreaked with yellowiſh. Gmel. *Streaked heron*, Arct. Zool.

Length ſeventeen inches; legs greeniſh. Inhabits North America.

Variegata. Ferruginous ſpotted with brown, beneath paler; front black; chin white. Scopoli. *Variegated heron*.

The thighs in this ſpecies are rufous, the legs brown. Size uncertain.

Cana. Cinereous; neck brown-aſh; belly, cheeks, and chin white. Gmel. *Aſh-coloured heron*, Arct. Zool.

Length twenty-five inches; the bill black; feathers of the flanks long and broad; legs yellowiſh.

Carcy-

Carunculata. Back, wings, legs, and crown black-blue; ſmooth head, and neck white; body beneath black; bill and chin carunculated. Lath. *Wattled heron.*

Size of the common ſtork, and inhabits Africa. This ſpecies is not common; the bill is black, with a red baſe; orbits naked and red; irides reddiſh; and the two wattles hanging from the chin covered with white feathers.

Malaccensis. Brown; beneath, wings, and tail white; ſmooth head, and neck ſtreaked with brown and white; face naked and cinereous. Gmel. *Crabier de Malac*, Buff.

Length nineteen inches; the bill black, with the baſe at the ſides yellow; feathers of the head and neck long, narrow and looſe; legs yellow. Native of Malacca.

Cinnamomea. Cinnamon colour; head ſmooth; chin and vent white; throat ſtreaked with brown; a white ſtripe on each ſide the chin. Gmel. *Cinnamon heron.*

Native of China.

Pumila. Smooth head and neck, varied with yellowiſh, cheſnut, and white; body above cheſnut, beneath whitiſh; tail ſnowy. Lepechin. *Dwarf heron.*

Length nineteen inches; the upper mandible black, with a yellowiſh edge; lower pale ochre with yellowiſh baſe; face ochre; chin, and band reaching as far as the breaſt white; rump ſnowy; legs dirty-aſh. Found about the Caſpian ſea.

Badia. Cheſnut, beneath whitiſh, with a longitudinal ſnowy ſtripe down the middle; quill-feathers black; wing-coverts blueiſh. Gmel. *Cancrophagus caſtaneus*, Briſſ. *Crabier roux*, Buff. *Cheſnut heron.*

Size of a crow; the bill brown, irides yellowiſh; tail cheſnut, and legs red. The ſpecies builds in trees, and inhabits Sileſia.

Philippensis. Beneath white; ſmooth crown, and neck above reddiſh-brown; back with tranſverſe brown and rufous lines; wings and tail black; throat reddiſh dirty white. Gmel. *Cancrophagus Phillippenſis*, Briſſ. *Petit crabier*, Buff. *Philippine heron.*

Length eleven inches; the bill greeniſh-yellow; face naked and green; wings edged with reddiſh white; legs yellow. Inhabits the Philippine iſlands.

Novæ Guineæ. Black; head ſmooth; face naked and greeniſh. Gmel. *Crabier noir*, Buff. *New Guinea heron.*

Inhabits New Guinea; the length ten inches; irides yellow.

Cyanopus. Cinereous, beneath white; head ſmooth; face blue; quill-feathers partly white, partly black. Gmel. *Ardea Americana cinerea*, Briſſ. *Crabier cendré*, Buff. *Cinereous heron.*

Rather larger than a crow; the bill blue, with black tip; wing-coverts cinereous mixed with black; legs blueiſh.

Maculata. Brown; neck above, and upper part of the back, ſpotted with white; head ſmooth; lores naked and greeniſh. Gmel. *Botaurus nævius*, Briſſ. *Butor tacheté ou Pouacre*, Buff. *Schwarzer reiger*, Friſch. *Spotted heron.*

Inhabits the fens of Europe; the length about eighteen inches; bill black; beneath greeniſh yellow; quill-feathers with a black ſpot at the tip; legs greeniſh-brown.

Gardeni. Brown; head ſmooth; back blackiſh; throat and breaſt whitiſh, ſpotted with brown. Gmel. *Pouacre de Cayenne*, Buff. *Gardenian heron*, Arct. Zool.

Native of Cayenne and Carolina. A bird of this kind has been once taken in England.

Exilis. Smooth head and body above reddiſh-bay, beneath white; ſides of the neck rufous; wings and tail black. Lath.

Size of the thruſh, the length eleven inches and a half; bill greeniſh; lateral and lower feathers of the neck long and looſe; breaſt browniſh-black; middle wing-covert ferruginous; ſome of the quill-feathers tipped with cheſnut; legs green. A rare ſpecies found in Jamaica.

Minuta. Head ſmooth; body brown, beneath reddiſh; tail-feathers greeniſh black; lores yellowiſh (male). Body brown, edges of the feathers reddiſh, beneath reddiſh; crown, back, wings, and tail black (female). Cranz, &c. *Ardeola*, Briſſ. *Blongios de Suiſſe*, Buff. *Little bittern*, Do. nov. Br. Birds.

This elegant ſpecies is about fifteen inches in length, the bill yellowiſh-green; irides ſaffron, and the legs green-brown. The little bittern is a native of Aſia and Europe, and is rarely met with in Britain.

Pondiceriana. Greyiſh-aſh; quill-feathers long and black; middle claw not ſerrated. Gmel. *Bec ouvert*, Buff. *Pondicherry heron.*

Native of India; the bill yellow, thick at the baſe, pointed at the tip, and a little bent in gaping in the middle; ſpace between the bill and eyes feathered; and the legs yellow. Length fourteen inches and a half.

Coromandeliana. White; back, wings, and tail black; upper mandible ſerrated from the middle to the tip. Gmel. *Bec ouvert des Indes*, Sonner. *Coromandel heron.*

Haunts marſhy places on the coaſt of Coromandel from September to November, and feeds on fiſhes and reptiles. The bill and legs are reddiſh-yellow; upper part of the head lineated with black; lores and chin naked and black; irides red; toes connected at the baſe.

Scolopacea. Brown; throat and breaſt ſtreaked with white; chin and legs white; wings and tail ſhining braſſy. *Coorlan ou courliri*, Buff. *Scolopaceous heron.*

Inhabits Cayenne; the bill browniſh-red, the tip blueiſh, and bent a little in; noſtrils a ſmall narrow ſeat in the furrow of the bill; orbits naked and tawny; middle toe connected at the baſe, and pectinated on the inner edge; legs whitiſh. Length twenty-five inches. Allied to the genus, Scolopax.

The heron is a very great devourer of fiſh, and does more miſchief to a pond than even an otter. People who have kept herons, have had the curioſity to number the fiſh they fed them with into a tub of water, and counting them again afterwards, it has been found that they will eat fifty moderate ſize dace and roaches in a day. It has been found that in carp ponds, viſited by this bird, one heron will eat up a thouſand ſtore carp in a year, and will hunt them ſo cloſe as to let very few eſcape. The readieſt method of deſtroying this miſchievous bird, is by fiſhing for him in the manner of pike, with a baited hook. When the haunt of the heron is found out, three or four ſmall roach or dace are to be procured, and each of them is to be baited on a wire, with a ſtrong hook at the end, entering the wire juſt under the gills, and letting it run juſt under the ſkin to the tail, the fiſh will live in this manner five or ſix days, which is a very eſſential thing; for if it be dead, the heron will not touch it. A ſtrong line is then to be prepared of ſilk and wire twiſted together, and is to be about two yards long; tie this to the wire that holds the hook, and to the other end of it there is to be tied a ſtone of about a pound weight; let three or four of theſe baits be ſunk in different ſhallow parts of the pond, and in a night or two's time, the heron will not fail of being taken by one or other of them.

When hawking was more in uſe, and laws were enacted for the preſervation of the ſpecies, the heron afforded a great deal of ſport to the people who loved that diver-

fion. There is but very little art in this flight of the hawk; but as both the birds are large and courageous, the fight is finer than in the flight of fmaller birds that make no refiftance. At the beginning of March the herons begin to make their paffage; if, therefore, you will adapt your hawks to the heron, they muft at this time be ufed to fly at the rivers and abont waters; and they muft be fed with light meats; then the hawk is to be entered at the game by getting a living heron and cutting its wings, or difabling it in fuch a manner that it cannot fly; then it is to be fet on the ground and the hawk unhooded and let go at her. If the hawk feize the heron, the falconer muft run to her affiftance and kill the heron, giving the hawk her reward, the heart, and letting her ftand over the opened breaft, and feed on other parts of the entrails; then let her be hooded, and afterwards the bird is to be fwung about the head, and the hawk taught to come and feed on it out of the falconer's hand.

When the hawk is thus fairly entered, another live heron is to be procured, and let off in an open field undifabled. As foon as fhe is rifen to a confiderable height in the air, the hawk is to be let out after her; if the hawk clofe with her, and bring her down, the falconer is to run up to her affiftance, and ficking the heron's bill in the ground, and breaking her wings and legs, the hawk is to be left to feed and plume upon her. When fhe is thus well managed, fhe may be taken to the waters, and let at a wild heron in the following manner:

When a heron is found, the falconer is to get as nigh her as he can, going under the wind with his hawk, which muft be a gerfalcon, or jerkin, with a haggard falcon for the driver. Thus having the hoods loofe as foon as ever the heron is up, let off the driver, which makes up to her, and caufes her to work in the wind; then let go the hawks that are to fly at her; but when they have worked above the heron, that they come through her, they will make her come to fiege. When they have got her down, the falconer muft make up to them as quick as poffible, and affift them by breaking her legs and wings, and thrufting her bill into the ground. For this flight of the hawk there fhould always be a dog trained up to the fport, whofe bufinefs it is to come up and kill the heron the moment that he fees her fall.

If the hawk cannot bring her down, or gives over the flight, then give her a train heron or two in a proper place, before fhe is trufted at a wild heron again, otherwife fhe will be difheartened and fpoiled.

A heron at fiege, is one ftanding at the water-fide watching for prey.

Heron *Iflmd*, in *Geography*, a fmall ifland in the gulf of Mexico, near the coaft of Florida. N. lat. 30 17'. W. long. 88 8'.

HERONA, in *Ancient Geography*, a town of Dalmatia, fituated in the interior part of the country, according to Ptolemy.

HERONE, a promontory of India, on this fide of the Ganges, according to Arrian.

HEROOPOLIS, a town of Egypt, at the lower extremity of the Arabic gulf; and a promontory of Egypt in the fame gulf is called "Heroopoliticum Promontorium."

HEROPHILUS, in *Biography*, a celebrated phyfician among the ancients, was probably a native of Chalcedon, on the Bofphorus, and was a difciple of Praxagoras. Galen, indeed, has called him a Carthaginian (De Ufu Part. lib. i. cap. 8.); but in the book entiled "Introduction," which is attributed to Galen, he is faid to be of Chalcedon. The learned Le Clerc confiders the epithet of Galen as a miftake of the copyifts, who, by the change of one letter, and the tranfpofition of another, wrote Καρχηδόνιος for χαλκηδόνιος. Herophilus lived under Ptolemy Soter, and was contemporary with the philofopher Diodorus, and with the celebrared phyfician Erafiftratus, with whofe name his own is commonly affociated in the hiftory of anatomical fcience. (See Erasistratus.) An anecdote is related by Sextus Empiricus of this great dialectician, Diodorus, who maintained, by a fophifm, that there was no fuch thing as motion: if a body moves, he faid, it moves either in the place where it is, or where it is not; but in the place where it is, it neceffarily remains; and in the place where it is not, it can neither act nor be acted upon; confequently, there is no fuch thing as motion. Herophilus foon had an opportunity of refuting this fophifm practically; for Diodorus, having diflocated his fhoulder, applied to Herophilus in order to have it replaced. But, faid the phyfician, either your limb has been difplaced where it was, or where it was not; now, according to your own principles, neither the one nor the other could happen; confequently, your arm has not been diflocated. The poor philofopher, however, deprecated both his ridicule and his dialectics, and begged that he would apply the rules of his own art to the reftoration of the diflocated limb. As a phyfician, Herophilus is mentioned with praife, both by the ancient and the early modern writers, as by Cicero, Plutarch, Pliny, &c.; the laft of whom calls him "clarus medicinâ," and mentions him as the founder of an ingenious fect. (Nat. Hift. lib. xxv. et xxvi. cap. 2) Scribonius Largus efteems him as one of the greateft phyficians; and Galen affirms, that he was as much diftinguifhed by his anatomical knowledge, as Cratevas and Diofcorides by their fkill in medicaments. Vefalius again even preferred him to Galen; and Fallopius affirmed, that his authority in anatomy was equal to that of the Gofpel;—"contradicere Herophilo in anatomicis, eft contradicere evangelium." We have a very imperfect opportunity, however, of judging of the correctnefs of thefe praifes, as his works are loft.

Herophilus and Erafiftratus were probably the firft who diffected human bodies, under the permiffion of the firft Ptolemies, at Alexandria; although it would appear that the fucceeding fovereigns of that name either imbibed the prejudices of the people on that fubject, or did not think proper to oppofe them; for the diffection of human bodies, even in the time of Galen, was fcarcely permitted. Thefe two anatomifts are faid to have diffected even living men, certain criminals being awarded them for that purpofe. (See Celfus, De Med. Præf.) Tertullian affirms, that Herophilus, whom he calls a butcher rather than a phyfician, had cut up many hundreds, although he juftly obferves with Celfus, that they could not thus inveftigate the motions of the living body, but thofe occafioned by death, and that of the moft torturing kind. "Herophilus ille medicus, aut lanius, qui fexcentos exfecuit ut naturam ferutaretur, qui hominem odit ut noffet, nefcio an omnia interna ejus liquido explorarit, ipfa morte mutante quæ vixerant; et morte non fimplici, fed ipfa inter artificia exfectionis, &c." (Tertullian, rnum effe fpirit. et animum.) This may be true, but Le Clerc is difpofed to believe, that the fame fabulous difpofition which repreferted Medea, who firft employed the warm bath, as boiling men alive, likewife deferibed the firft anatomifts of the human body as the butchers of men.

The extent to which diffection was purfued by Herophilus is manifeft, both from the teftimony of Galen and others, and from the prefent nomenclature of anatomifts, who ftill employ feveral of the denominations by which he and Erafiftratus

ſtratus deſignated different parts of the body; for it is not eaſy to point out the reſpective diſcoveries of theſe two anatomiſts. They were the firſt who inveſtigated the brain and nervous ſyſtem. Herophilus, according to Rufus the Epheſian, diſtinctly marked the difference between three ſorts of nerves (the word nerve being common alſo to *tendon* and *ligament*), the firſt of which (now excluſively called nerves) were "ſubſervient to ſenſation and voluntary motion, and originated partly from the brain and partly from the ſpinal marrow." It would ſeem that a diſcovery, that has been conſidered as peculiarly modern, was partly made by Herophilus and Eraſiſtratus, namely, that of the *lacteal* abſorbents. For Galen quotes the following ſentence from the writings of the latter. "If we lay open the abdomen, we diſtinctly obſerve arteries in the meſentery; in young kids theſe are filled with milk, but not in the adult animals." (Galen, an ſanguis in arter.) And in another place, he ſpeaks of certain veins obſerved in the meſentery, and "intended for the nouriſhment of the inteſtines, according to Herophilus, who remarked, that they did not paſs to the liver, like the reſt of the abdominal veſſels, but terminated in certain glandular bodies." (Galen, De Uſu Partium, lib. iv. cap. 19) Herophilus firſt named the upper part of the inteſtines *duodenum*, or rather δωδεκαδάκτυλον, implying its length to be about twelve inches. From accurate obſervation of the pulmonary veſſels, he gave the name of "arterial vein" to the pulmonary artery, and that of "venous artery" to the pulmonary vein; he alſo uſed the term *retina* for the internal coat of the eye; and the term ληνὸς, or wine-preſs, for the fourth ſinus in the brain, which retains the denomination at this day, with the addition of his name, being now called *torcular Herophili;* and he firſt named the *tela choroidea*. We are altogether unacquainted with his notions reſpecting the uſes of theſe organs, except that he conſidered the ventricles of the brain as the ſeat of the rational ſoul; a ſuppoſition at leaſt as plauſible as the more modern ſituation provided for it in the pineal gland.

Of the opinions of Herophilus in regard to diſeaſes, and of his practical precepts, nothing has deſcended to us, except a few unſatisfactory fragments preſerved by Cœlius Aurelianus. He is allowed, however, to have been the firſt of the ancients who paid accurate attention to the variations of the pulſe. Hippocrates had, indeed, occaſionally mentioned the ſtate of the pulſe in ſome of his deſcriptions of diſeaſes; but Herophilus firſt drew the attention to four qualities of the pulſation, *viz.* the magnitude or fulneſs of the artery, the frequency, the ſtrength, and the rythm or regularity of the beats; he likewiſe obſerved the equality or inequality of the pulſe, and perhaps ſome other varieties, which drew upon him the ridicule of Pliny, who ſaid that it was neceſſary to be a muſician, in order to comprehend the proper cadence and rythm of the pulſe. Nat. Hiſt. lib. xxix. cap. 1. &c.—Galen de Different Pulſ. lib. ii. cap. 3.

Herophilus, it would appear, had great faith in the powers of herbs and drugs in general, and made a more extenſive uſe of them in his practice than his predeceſſors. According to Celſus, Herophilus and his diſciples principally introduced the general uſe of medicaments in the treatment of almoſt every diſeaſe, in which the cure had formerly been effected chiefly by diet and regimen. (Præf. ad lib v.) And Pliny informs us, that Herophilus uſed to aſſert, that all herbs, even thoſe which we daily tread under our feet, are poſſeſſed of uſeful remedial properties. (Plin. lib. xxv. cap. 2.) He inſiſted, however, upon the neceſſity of ſtudying the nature of theſe properties; for he was wont to obſerve, that medicines were either nullities, or they were "the hands of the gods," according to the ſkill with which they were employed. White hellebore was held in high eſtimation by him, on account of the powerful action which it was capable of exciting in the body. Plin. loc. cit. lib. xxv.

The ſchools of Herophilus and Eraſiſtratus at Alexandria, we are aſſured by Galen, continued to flouriſh a long time after the death of their founders; and among the diſciples of Herophilus were many diſtinguiſhed phyſicians, eſpecially Zeuxis of Tarentum, Alexander Philalethes, Zenon, Andreas, Mantias, Apollonius Mus, Philinus, &c. Indeed, Ammianus Marcellinus, who lived about ſix hundred and fifty years after the ſchools were ſet up, ſays, that they were ſo famous in his time, that it was enough to ſecure credit to any phyſician, if he would ſay that he had ſtudied at Alexandria. See Le Clerc Hiſt. de la Médecine.—Goelicke Hiſtoriæ Med. Univerſ. Period. 6ta.—Barchuſen Hiſt. Medicinæ.

HEROWRA, in *Geography*, a town of Hindooſtan, in Oude; 17 miles S. of Kairabad.

HERPA, in *Ancient Geography*, a ſmall town of Aſia, ſituated in the mountains from which proceeded the river Carmalus, S. E. of Oſdara.

HERPES, in *Medicine*, from ἕρπω, *to creep*, a term applied to ſeveral cutaneous eruptions, from their tendency to ſpread or creep from one part of the ſkin to another.

From the extreme variety of the appearances of eruptions on the ſkin, a great difficulty has occurred in deſignating them by appropriate appellations, and a great confuſion has enſued in the various acceptations in which different writers have employed the ſame words. The term *Herpes*, in particular, has been ſo variouſly applied by different phyſicians, both ancient and modern, that it is now almoſt impoſſible to diſcover the true character of the eruptions, which ſhould be claſſed together under that title. In fact, like the terms *ſcurvy* and *ſcorbutic*, the words *herpes* and *herpetic* are now ſo indiſcriminately employed, that they have ſcarcely any other or more definite meaning, than the general term *cutaneous*. We remember, indeed, to have heard a lecture from the profeſſor of materia medica at Edinburgh, in the year 1801, in which he aſſumed the word *herpes* as a generic name, and divided the whole liſt of chronic cutaneous diſeaſes into ſo many ſpecies of this genus, under the appellations of Herpes *ſquamoſus*, H. *puſtuloſus*, H. *veſiculoſus*, &c. according to the particular appearance of ſcales, puſtules, veſicles, &c. which were predominant in each caſe.

It is extremely deſirable, however, that we ſhould come to ſome common underſtanding, in regard to the nomenclature of theſe diſeaſes, and agree to employ the ſame terms in the ſame preciſe ſenſe: an object which, it is hoped, the treatiſe of Dr. Willan will go near to effect. (See CUTANEOUS *Diſeaſes*.) In the ſyſtem of this author, the term herpes is confined to an eruption, which is, in its early ſtage, *veſicular*, i. e. conſiſting of patches of ſmall, tranſparent *veſicles*, or *phlyctænæ*. The propriety of this limitation is ſupported, on the whole, by authority. For although the term herpes may have been originally employed to denote any ſuperficial ſpreading eruption; it has been much applied, ſince the time of Galen, to veſicular eruptions. Of the three ſpecies mentioned by Galen, the H. *miliaris* (ἕρπης κεγχρώδης), and H. *phlyctænoides* (ἕρπης φλυκταινώδης), are of this nature; the third, H. *exedens*, (ἕρπης ἐσθιόμενος), ſignifying little ulcerations affecting the ſkin, but not penetrating deeper. The conſtant habit of confounding under the term *puſtule* both thoſe elevations of the cuticle which contain *pus*, (to which the term properly belongs, quaſi *pus tulit*,) and thoſe which contain *lymph*, (the proper *veſicles*,) has led to the application of the term

Herpes.

herpes to almoſt all puſtular and ſmall ulcerous diſorders of the ſkin. Thus, Dr. Cullen includes in his definition of herpes, both *veſicles* and *ſmall ulcers*; his words are, "phlyctænæ, vel ulcuſcula plurima, gregalia, ſerpentia, dyſepuleta." "Tumerous veſicles or little ulcers, in cluſters, ſpreading, and difficult to heal." (See his Noſol. Method. Genus cxlvi.) Sauvages has conſidered the eruption as conſiſting of *pimples* (papulæ), and not of puſtules: but it is obvious, that his definition of papula is not limited to the ſame ſenſe to which it is confined by Dr. Willan, but may include ſmall veſicles. He ſtates that the papula differs from the puſtule, "inaſmuch as it does not ſuppurate, but diſcharges a little moiſture from its apex, and then becomes ſcaly:" whereas Dr. Willan conſiders the pimple as not containing any fluid. If we take the word *papula* in this more extenſive ſenſe, the definition of Sauvages is tolerably correct. "Herpes eſt papularum congeries, ſeu efflorescentia ex tumoribus exiguis, rubris, aggregatis, pruriginoſis, in ſquamas furfuraceas, raro cruſtaceas abeuntibus." (Sauvages Noſol. Method. Claſs 1. Ord. 2. Genus 7.) The herpetic veſicles, however, as far as we have obſerved, generally terminate in thin ſcabby cruſts.

It is deſirable, then, that we ſhould, with Dr. Willan, confine the denomination of herpes to an eruption, which is in its origin characteriſed by cluſters of veſicles, containing limpid fluid, and very thickly congregated, upon a red baſe, which is common to each cluſter, and extends around it ſo as to form a narrow areola. Theſe cluſters gradually extend, and new ones ariſe, for the ſpace of three or four days or more, and then the veſicles become gradually more opaque and puſtular, flatten, and ultimately dry into cruſts or ſcabs. The whole courſe of the diſeaſe generally compriſes about a fortnight, under whatever variety it appears; the changes in the progreſs of the eruption correſponding nearly with thoſe obſerved in the ſmall-pox. The cluſters of veſicles generally aſſume more or leſs of the circular form; and when they occur upon the limbs, the ſucceſſive cluſters ſpread in a longitudinal direction, from above downwards, or *vice verſâ*; but when they appear on the trunk of the body, their tendency is to ſpread in a lateral direction, or round the body. When theſe eruptions are numerous and extenſive, ſome degree of feveriſhneſs precedes and accompanies them; but in the ſlighter caſes, no indiſpoſition of the general habit ariſes. Dr. Willan's treatiſe is not yet ſo far publiſhed, as to include an account of this diſeaſe: but we ſtate theſe obſervations from frequent communication with him on the ſubject, and have ſeen them ſtrictly verified in many inſtances in practice. We cannot, therefore, but conſider the herpes, thus characteriſed, as a diſtinct genus of diſeaſe, and no more to be confounded with eryſipelas, than with chicken-pox or ſcarlet fever. In order that we may not be miſunderſtood, we ſhall here deſcribe the moſt frequent form of the diſeaſe, namely, the

HERPES *Zoſter*, popularly termed *the Shingles*. This eruptive diſorder has been mentioned under a variety of names, but has not been very minutely deſcribed, as far as we know, until within the laſt century. It was called ζωστὴρ, (*a belt*,) by the Greeks; *zona*, (which has the ſame meaning,) ***zona ignea***, ***ignis ſacer***, by the Latins, and by modern writers. Sauvages has named it, in two different parts of his work, eryſipelas zoſter, and herpes zoſter; and Dr. Cullen claſſes it with the former diſeaſe, under the title of eryſipelas phlyctænodes, at the ſame time expreſſing a doubt of the propriety of this claſſification. De Haen has given a tolerably accurate account of the diſeaſe; and Burſerius has compiled a ſummary of the deſcriptions of theſe and other writers. Tulpius, Hoffmann, Calliſen, &c. have alſo deſcribed the complaint with conſiderable accuracy. (See Burſerius. Inſtit. Med. Pract. tom. ii. cap. 3. Tulpius, Obſerv. Med. lib. iii. cap. 44. Hoffmann, Med. Syſt. Rational. tom. iv. part i. cap. 13. § 6. and obſ. vi. Calliſen, Syſt. Chirurg. Hodiern. tom. i. p. 424. De Haen, De Divis. Febr. p. 112, &c.) The diſeaſe was noticed, however, by the ancients; for it may be recogniſed in the firſt ſpecies of *ignis ſacer*, mentioned by Celſus (De Medicinâ, lib. v. cap. 28. § 4.): and Pliny alſo briefly notices it, adding that popular notion reſpecting its fatality, if it completely encircles the body. "Zoſter appellatur, et enecat ſi cinxerit. (Nat. Hiſt. lib. xxvi. cap. 11.) It was no doubt included by Galen in one of his ſpecies of herpes.

The courſe of the ſymptoms of *the ſhingles* has been tolerably uniform in all the caſes we have ſeen. The commencement of the diſeaſe has generally been marked by a ſlight feveriſhneſs, loſs of appetite, and languor, the patients at the ſame time complaining of a ſenſe of heat, and of ſhooting pains through the cheſt or epigaſtric region. Theſe ſymptoms have occaſionally, however, been conſiderable, and occaſionally altogether abſent, or ſo ſlight as not to attract the notice of the perſon. On the ſecond or third day, ſeveral red patches have appeared on the ſkin of the abdomen, breaſt, or ſhoulder, upon which were numerous elevated points, cluſtered together, and accompanied by a ſenſation of heat and itching: theſe points ſpeedily enlarged to the ſize of a ſmall pearl, and put on the appearance of veſicles, filled with a very limpid fluid, and generally ſo cloſe ſet as to leave no interſtice between them; the whole cluſter forming a circular or oval patch, of various diameter, from one inch to two or three; and ſurrounded by a red margin. During two or three days, while the firſt patches were thus enlarging, others continued to appear, with ſome degree of regularity, and nearly in a line extending from the ſternum or the linea alba of the abdomen, round one ſide of the ſpine; ſometimes like half a ſaſh, round the waiſt, and ſometimes like a ſword-belt acroſs the ſhoulder. "Hac tamen perpetua lege," ſays De Haen, "ut ab anteriore parte nunquam lineam albam, nunquam à poſtica ſpinam tranſcenderent." This obſervation, however, is not without exceptions; although the great rarity of the occurrence probably gave riſe to the popular prognoſis above mentioned from Pliny, which is ſtill very prevalent. We have ſeen the eruption extend acroſs the linea alba in front; and Turner aſſerts, that he has more than once ſeen it completely ſurround the body. (On Diſeaſes of the Skin, chap. 5. p. 80.) Dr. Ruſſell, who has given a caſe of it (De Tabe Glandulari, Hiſt. xxxiii. p. 124.) and Tulpius alſo contradict the affirmation of Pliny. But to proceed:

In the courſe of four or five days, the eruption ceaſed to extend or multiply; and, in the mean time, the veſicles, which had firſt appeared, began to loſe their tranſparency, and to aſſume more of the character of puſtules; they became ſomewhat confluent, and commonly acquired by degrees a blueiſh or livid colour, ſinking ultimately into a thin brown ſcab. Thoſe patches, which appeared later, went through the ſame courſe; and in about twelve days or a fortnight, nothing but the brown dry ſcabs remained. In a word, the duration and progreſs of this eruptive diſeaſe, as we have heard Dr. Willan juſtly remark, is very ſimilar to that of the ſmall-pox. The fever, when it has been conſiderable, ſometimes ſubſides on the appearance of the eruption; but we have ſeen ſlight febrile ſymptoms continue during the whole courſe of the diſeaſe, probably from the inceſſant irritation of the painful itching and ſmarting which is connected with the eruption. In one or two inſtances, the moſt diſtreſſing part of the diſeaſe was an intenſe darting pain, not ſuperficial,

ficial, but deep-ſeated in the cheſt, which came on at the cloſe, and which was ſcarcely to be allayed by the power of opium. Hoffmann has made a ſimilar obſervation: "Inde quidem ſymptomata remiſerunt, excepto exquiſito ardente dolore, qui tantus erat, ut nec ſomnum capere, nec locum affectum contingere poſſet." (Loc. cit. obſ. vi.) A leſs degree of this pain is commonly complained of in the ſlighter caſes.

Diagnoſis.—The herpes zoſter, or ſhingles, then, is to be conſidered as a diſtinct eruptive diſeaſe, and to be claſſed with the febrile exanthemata, as Cullen and Burſerius have arranged it; but not as a variety of eryſipelas. For the eryſipelas conſiſts of extenſively diffuſed inflammation of the ſkin, with effuſion and much ſwelling; and the elevation of the cuticle which accompanies it, is in large irregular *bullæ*; the inflammation too is liable to extend deeply into the muſcular parts. Whereas the cluſters of ſmall tranſparent veſicles, undergoing a regular progreſs of maturation and encruſtation, without affecting any part below the ſkin, and without tumefaction, are characteriſtic of this herpes; not to mention the ſeverity of the fever connected commonly with the former, and the ſlight febrile derangement, if any, attendant on the latter. It is to be diſtinguiſhed, too, from the eruptions and ulcerations of the ſkin uſually denominated *herpetic*, by the ſame regularity of its courſe and limited duration. This is obſerved by Burſerius: "Zoſter acutus et *brevis* ut plurimum morbus eſt; nam quanquam Lorryus et chronicum, et interdum epidemicum eſſe exiſtimet, (quod de igne ſacro late ſumpto fortaſſe ei concedendum eſt,) hanc ſpeciem tamen diutinam non vidi." (Loc. cit. cap. 3. § 52.) Many writers, indeed, have mentioned the ulcerations which belong to *Herpes*, and even the *Zoſter*; but we are diſpoſed to believe that, either ſuch ulcers were the reſult of diſeaſes originally *puſtular*, and belonging to the *impetigo*, or running tetter; or that the buſy hand of art has interfered, in the caſe of the zoſter, and interrupted the healing proceſs of nature. For we believe that every form of herpes (characteriſed in its commencement by cluſters of *veſicles*) follows the ſame courſe, and the little ulcers which enſue, when the ſurface is broken, are diſpoſed to heal ſpontaneouſly in about fourteen days. We ſhall illuſtrate this immmediately, when ſpeaking of the cure.

Reſpecting *the cauſes of herpes*, it will be more rational to acknowledge our total ignorance, than to attempt, by any hypothetical ſpeculations, to deſcribe the nature of the morbid humours, which give riſe to the diſeaſe, or to refer the production of theſe humours to any particular mode of diet, as authors have generally done. For aſſuredly obſervation has not enabled us to deduce any ſatisfactory concluſions on the ſubject. Galen and his numerous followers, both ancient and modern, conſidered the herpetic veſicles as an effuſion of bile; but ſome of them believed that the *intemperies* was not purely bile, but an intermixture of *pituita* or phlegm. (See Sennertus, Pract. Med. lib. v. cap. 27.) The more modern chemical humourists conſidered the materies morbi to be a cauſtic acrid humour, partaking of the principle of putrefaction, carried outwards, and irritating the cutaneous nerves (Hoffmann, loc. cit.); and aſcribed the diſeaſe to ſalted food, to a ſcorbutic, and arthritic diatheſis, &c. But the diſorder ſeems to be independent of the diet; at leaſt we have ſeen it under very different circumſtances in that reſpect. It is not contagious, according to general obſervation of authors; and in twenty-two caſes, which we have witneſſed, it was neither traced to any contagious origin, nor was a ſecond perſon known to take the diſeaſe from any one of the individuals affected. There would ſeem to be a prediſpoſition to it in youth, eſpecially in the female ſex; for the caſes juſt mentioned occurred in females, moſtly in young females, with a very few exceptions which appeared in boys.

Some authors have deemed the herpes zoſter a malignant and dangerous diſeaſe, as Platner and Hoffmann; and Langius has deſcribed two caſes occurring in noblemen, which proved fatal. (Epiſt. Medicin. p. 110.) We have no doubt, however, from the account which he gives of theſe caſes, that he was miſtaken in referring them to the diſeaſe in queſtion. Lorry and Geoffroy more correctly conſider the ſhingles as free from danger (ſee Geoffroy, in Hiſt. de la Soc. Roy. de Med. an. 1777-8); and Burſerius aſſerts that, like them, he never ſaw a fatal caſe. Of the twenty-two inſtances which have occurred to us, not one exhibited any untoward ſymptom; the majority of the patients were not confined to the houſe; the complaint was mild and harmleſs, and ſlight debility enſued.

Of the cure of this complaint, therefore, little need be ſaid; gentle laxatives and diaphoretics, with occaſional anodynes, when the ſevere deep-ſeated pain, to which we have alluded, occurs, ſeem to be the only medicines requiſite to alleviate the ſymptoms during its courſe. (See Edin. Med. and Surg. Journal, vol. i. p. 389.) Yet moſt of the writers on the ſubject, even ſo late as Burſerius, prejudiced by the humoral doctrines, have been fearful of interrupting the ſuppoſed operation, by which the conſtitution rids itſelf of the morbid matter, and have expreſſed many cautions againſt the early and free uſe of purgatives. This, however, is contradicted by experience. But if the neglect of evacuating the alimentary canal be prejudicial, the humoral hypotheſis has led to much more pernicious practice, in reſpect to the external treatment of the eruption. We have not found it neceſſary to make any particular applications to the cluſters of veſicles, except that, when the tops are rubbed off, as they are liable to be, by the friction of the clothes, and a ſlight diſcharge of a thickiſh ſerum takes place, which occaſions the linen to adhere to the parts, a little ſimple ointment may be uſefully interpoſed to prevent that conſequence. We are diſpoſed to believe, therefore, that the ulcerations, which have been ſaid to enſue, and to be dangerous and troubleſome, were the reſult of the buſy hand of the practitioner. Thus Turner, when the eruption was "all out and ripened," uſed to "ſnip the heads of them with a pair of fine ſciſſors," and then apply a ſoft rag "to ſuck up the humours, and prevent further erоſion," and he then covered the parts with the "unguentum *Diapompholygos*," &c. or with his own cerate. But Ruſſel, not content with this mode of clearing away the humours, when he ſaw the eruption turning livid, (in its natural decline,) he cut open the veſicles, irritated them with the red precipitate and plaiſtered them over, although the patient previouſly complained of the extreme tenderneſs of the eruption, which he could not bear to be touched. "Illa autem, ut inſpicio," he ſays, "veſiculis depreſſis, et minime tumentibus, at leveſcentibus inducta eſſe, atque acrem quendam ichorem ſubſtare cerno, proinde ſecantur veſiculæ, et præcipitato rubro, cum unguento aur et cerato, ut medicamenta fixa atque immota remanerent, curantur." Loc. cit.

Theſe pernicious interruptions of the healing proceſs, which were called remedies, ſufficiently explain, we imagine, the appearance of ulcers, and their troubleſome duration, beyond the natural period of the diſeaſe, as well as the erroneous

roneous descriptions of it, which the earlier practitioners were thence led to give. We are the more disposed to form this opinion, from observing the effect of a similar practice, in another variety of herpes. This form of the herpetic eruption has not been described, we believe, except by a writer in the Med. and Phys. Journal for May or June 1810, where an imperfect plate of it is given. It occurs on the *prepuce*; and although unaccompanied by any constitutional affection, its extent being small, it observes nearly the course of the eruption of the zoster, and its regular duration is a fortnight. The attention of the patient is called to the part by an extreme itching, with some sense of heat; and on examining the prepuce, he finds a small red patch or two, upon which are clustered five or six minute transparent vesicles; these enlarge, and, in the course of twenty-four or thirty hours, become of a milky opacity, and on the following day look pustular, and soon break, especially if seated in the inner surface of the prepuce, so as to be constantly covered and kept moist. They then ulcerate, most commonly becoming confluent, so as to form one or two ulcers, according to the number of patches. Now if these ulcerations are constantly kept clean, or if a little dry lint is laid over them, so as to absorb the matter discharged, they do not spread; but, continuing very tender and irritable, heal about the thirteenth or fourteenth day. Ointments appear to irritate them, increase their soreness and discharge, and delay their healing. We once saw, in an individual who has had many returns of the complaint, these ulcerations mistaken for venereal chancre, and the red oxyd of mercury applied to them; the consequence was an increase of the ulcerations, and of their irritability, a hardness surrounding them, and an elevation of the edges, with a very considerable prolongation of the duration of the complaint. It has recurred repeatedly in the same individual, altogether independent of any suspicious connection, and has uniformly followed the course above described, when not interfered with.

Turner mentions a singular nostrum for the cure of herpes, which was employed in a case, from which he was dismissed as soon as he had pronounced the name of shingles, this remedy being considered as specific; namely, the blood of a *black* cat, taken from *the tail* by cutting off the end of it, and besmeared upon the eruption! See Ring-*worm*.

HERPESTIS, in *Botany*, ερπης, *any thing which creeps*, Gærtn. fil. v. 3. 187. t. 214. Brown Prod. Nov. Holl. 441. (Moniera. Browne Jam. 269. t. 28. f. 3. Michaux Boreal-Amer. v. 2. 22.—Class and order, *Didynamia Angiospermia*. Nat. Ord. *Personatæ*, Linn. *Scrophulariæ*, Juss.

Ess. Ch. Calyx inferior, in five deep segments, of which the two inner ones are smallest, and concealed by the others. Corolla tubular, somewhat two-lipped. Stamens included; lobes of the anthers divaricated. Stigma emarginate. Capsule inclosed in the gene ally enlarged calyx, with two cells, and two divided valves; the partition parallel, unconnected with the valves, but bearing the receptacles of the seeds. *Brown*.

An exotic genus of herbs with opposite leaves and axillary flowers, each of whose stalks bears a pair of bracteas. It contains the *Gratiola Monnieria* of Linnæus, and a few other species. The only one found by Mr. Brown in New Holland is

H. floribunda. "Smooth and upright. Leaves linear-lanceolate. Calyx of the fruit reticulated, and somewhat heart-shaped. Bracteas below the top of the flower-stalks."—It grows within the tropics. N.B. The reader who refers to Gratiola is requested to read *hyssopoides* for *hypopoides* in the 4th paragraph, and in that after the 6th species.

HERPET, in *Geography*, a town of Hindoostan, in the Carnatic; 20 miles N. of Bomrauzepollam.

HERPETON, in *Surgery*, a creeping pustule, or ulcer. The term is used by Hippocrates, and is derived from ερπω, *to creep*.

HERPIDITANI, in *Ancient Geography*, a people of Africa, in Mauritania Cæsariensis, who inhabited the Chalcorichian mountains E. of the river Malva.

HERQUI, or Erqui, in *Geography*, a cape on the coast of France, in the department of the North coast. N. lat. 48° 35′. W. long. 2° 37′.

HERRADURA, a sea-port of Spain, in which a fleet of gallies, under the command of general Don John de Mendoza, was lost in 1562; between Motril and Velez Malaga.—Also, a town of South America, in the province of Chili; five miles S.W. of Coquimbo.—Also, a river of Mexico, which runs into the Pacific ocean, N. lat. 9° 30′.

HERRENBERG, a town of Wurtemberg, which, at several times, has been damaged by fire and by hostile attacks; 14 miles S.S.E. of Stuttgard.

HERRENBREITUNGEN, a town of Germany, in the county of Henneberg, situated on the Werra; 20 miles W. of Smalkelden.

HERRERA Tordesillas, Anthony, in *Biography*, born in 1565, was son of Roderic de Tordesillas, and Agnes de Herrera, and, according to the custom of his country, he bore his mother's name. He was, as a public character, first secretary to Vespasian de Gonzaga, the viceroy of Navarre and Valentia, after whose death, Philip II appointed him historiographer for the Indies; and in this capacity he wrote his general history of the Indies, in four volumes folio. This work, with a description of the West Indies, gives an account of all the transactions of the Spaniards there from 1492 to 1554, and it is said by Dr. Robertson to furnish the fullest and most accurate information concerning the conquest of Mexico, as well as of every thing else that relates to America. Some critics reckon him too fond of the marvellous, and censure his style, as partaking of the timidity of the country. Herrera composed a general history of his time, from 1554 to 1598, in three volumes folio. He died in 1625. Moreri. Robertson.

Herrera, Ferdinand de, a Spanish poet who flourished in the 16th century, was a native of Seville. In 1582 he published a collection of lyrical and heroic poems, which was reprinted in 1619. These poems acquired their author a high reputation, and he was regarded as one who had attained to the greatest excellence in the lyric poetry of Spain. His style is neat, correct, elegant, and copious. He published an edition of Garcilasso de la Vega, with notes; the life of sir Thomas More; and a narrative of the war of Cyprus, and the battle of Lepanto. Moreri.

Herrera, Francisco de, surnamed the *Elder*, was a painter who was born at Seville, a fellow scholar of Pacheco in the school of Luis Fernandez, and was the first who freed the pencil from that timidity which had, till then, marked the execution of Andalusian painters, and may be considered as the founder of a new school, which counted among its primitive pupils, Diego Velasques; but, though decided and rapid, Herrera was no mannerist; his works bear the test of minute inquiry in design and composition, and charm by colour; such is his Last Judgment, in St. Bernardo at Seville, and a fresco in the Cupola of St. Bonaventura.

ventura. The common objects of life he imitated with uncommon precision; his kitchens, ales, hostels, are as exquisite as difficult to be obtained. He has left some etchings, and he worked in bronze, which led him to forge coin; he was discovered, and, to escape the hands of justice, took an asylum with the Jesuits, who obtained his pardon from Philip IV. 1624. Herrera had two sons; the elder, called El Rubio, died young; the second called

Herrera el Mozo, or the *Younger*, was likewise named Francisco, and inherited his father's talents to a considerable degree. He studied at Rome, and from his skill and taste in representing Bambocciate, fish, and still life, was, by the Italians, nicknamed Il Spagnolo degli Pesci. On his return to Seville, he was soon distinguished, and made sub-president or director of the academy established in 1660; but, too proud to submit to the superior authority of Murillio, he went to Madrid, rivalled the most favourite artists, and was employed by the court. The St. Hermengildus painted for the Carmelites, the frescoes of the chapel San Felipe el Real, and the Assumption of the Virgin in that of the Madonna de Atocha, procured him, with the execrations of his rivals, the honours of principal painter to the king, and the place of principal master of the royal works. He died at Madrid in 1685, at the age of 63.

The style of El Mozo allures with vigorous contrasts of chiaro-scuro and a composition full of fire; but his colour has neither the mellowness nor the imparts of his father's, whom he nearly equals in Bambocciate, and excels in flowers. Of architecture his knowledge was superficial, notwithstanding the praise of Palomino. His powers upon the whole, whatever be their scale, were certainly inferior to his opinion of them. Fuseli's Pilkington.

Herrera, in *Geography*, a town of Spain, in Old Castile, 32 miles N.N.W. of Burgos.

HERRGOTT Marquard, in *Biography*, a learned and celebrated Benedictine of the abbey of St. Blaise, was born, in 1694, at Fribourg. Having completed his own education at his native place, he went to Strasburg, at the age of 15, to engage in the duties of private tutor to the sons of a merchant of that city. He accompanied his pupils to Paris, where he resided two years, and then returned to Strasburgh. In his 20th year he entered into the order of the Benedictines, and, having passed through various degrees of promotion, died at Vienna in 1762. As an author, his great work was entitled, "Genealogia diplomatica Augustæ gentis Habsburgicæ." This work was so well received that he was induced to undertake another, *viz.* "Monumenta Aug. Domus Austriacæ," which was patronised by the emperor Charles VI. and by the empress-queen Maria Theresa, and obtained a degree of success equal to the other. According to the plan laid down by the author, the work was divided into five parts. The first was to contain the seals and various marks of honour; the second, the medals and coins; the third, the paintings and statues; the fourth, the monuments; and the fifth, inscriptions from churches, palaces, tomb-stones, &c. The first three parts were published in the lifetime of the author, who associated with himself father Rusten Heer. The fourth part was burnt with the abbey of St. Blaise in 1768; and, the authors being dead, this part was re-composed by Gerbet, prince abbot of St. Blaise, and published, in two volumes, under the title of "Topographia Principum Austriæ, quæ est pars i. et ii. tom. 4. et ultimi Monumentorum Domus Austriacæ, St. Blasii." 1772. Gen. Biog.

HERRICKS, in *Geography*, a post-town of America, in New Hampstead, Queen's County, Long island, in the state of New York; 28 miles E. of New York city.

HERRING, Thomas, in *Biography*, son of a clergyman at Walsoken, in Norfolk, was born in the year 1693. He was educated in grammar learning at Wisbeach school, in the isle of Ely, from whence he removed to Jesus College, Cambridge, where he continued till he took his degree of B.A. in 1714. He then removed to Bennet College, obtained a fellowship there in 1716, and was in the following year admitted to the degree of M.A. He undertook the office of tutor in his college, in the classical department, which he filled with great reputation for more than seven years. Upon his entering into orders he became minister of Great Shelford, and other places, in the neighbourhood of Cambridge. In 1722 the bishop of Ely made him his chaplain, and presented him to the rectories of Rettingdon, in Essex, and Barley, in Hertfordshire. Two years after this he proceeded to the degree of B.D., and in 1726 he was chosen preacher to the honourable society of Lincoln's Inn. About the same time he was appointed chaplain in ordinary to his majesty, and in 1728 commenced doctor in divinity at Cambridge. In 1731 he was made dean of Rochester, and in 1737 raised to the bishopric of Bangor, from whence, in 1743, he was translated to York. Here he had, in a short time, a full opportunity of displaying a noble zeal for the reigning family, and the interests of the Protestant religion. Amidst the consternation which, in the year 1745, spread through all ranks, when the news arrived of the defeat of the king's troops at Preston Pans, the archbishop's ardour in the cause of civil and religious liberty displayed itself in the most eminent manner. He roused the people to a sense of their danger, and, while he greatly contributed, by his exhortations, to remove the general panic, animated them to associate with firmness and vigour in defence of their country. At a general county meeting, held at York, he addressed the people then assembled in a spirited speech, urging them to unite as one man to stop the danger; and he called on them liberally to contribute to a subscription, which had been begun in order to raise troops for their defence. His patriotic enthusiasm was seconded by that of the whole assembly; 40,000*l.* were subscribed on the spot. For his great zeal in this crisis of national danger he was, in 1747, to the general satisfaction of the nation, raised to the see of Canterbury. He died at Croydon in the year 1756, when he was about 63 years of age. He is characterized by Dr. Jortin as having possessed piety without superstition, and moderation without meanness, an open liberal way of thinking, and a constant attachment to the cause of sober and rational liberty, both civil and religious. Thus he lived and died; and few great men passed through a malevolent world better beloved and less censured than he. A volume of sermons, on public occasions, has been published since his death by Mr. Duncombe, with a preface, containing some memoirs of the author's life. In 1777 the same gentleman gave the world likewise a volume of the archbishop's letters, with notes, and an appendix, which may be considered as a happy model for a polite correspondence between men of learning. Biog. Brit. Gen. Biog.

HERRING, Harengus, in *Ichthyology*, a species of the *clupea*, which see.

The name *herring* is derived from the German *heer*, an *army*, which expresses their number, when they migrate into our seas. Herrings are found in great plenty from the highest northern latitudes as low as the northern coast of France. They are also met with in vast shoals on the coast of America, as low as Carolina; they are found also in the sea of Kamtschatka, and possibly reach Japan: but their winter rendezvous is within the arctic circle, whither they retire after spawning, and where they are provided with plenty of

of infect food. For an account of the remarkable migration of herrings (a fact, however, which ſome have diſputed, ſee CLUPEA), and the hiſtory of the fiſhery, &c. ſee *Herring* FISHERY.

They are in full roe at the end of June, and continue in perfection till the beginning of winter, when they begin to depoſit their ſpawn.

There are divers names given to preſerved herrings, according to the different mode in which they are managed: as,

1. *Sea-ſticks.* Theſe are ſuch as are caught all the fiſhing ſeaſon, and are but once packed. A barrel of theſe holds ſix or eight hundred; eight barrels go to the ton, by law; a 100 of herrings is to be a 120; a laſt is 10,000; and they commonly reckon 14 barrels to the laſt.

There are others, repacked on ſhore, called *repacked* herrings; 17 barrels of ſea-ſticks commonly make from 12 to 14 of repacked herrings.

The manner of repacking them is to take out the herrings, waſh them out in their own pickle, and lay them orderly in a freſh barrel: theſe have no ſalt put to them, but are cloſe packed, and headed up by a ſworn cooper, with pickle, when the barrel is half full. The pickle is brine; ſo ſtrong, as that the herring will ſwim in it.

2. *Summers.* Theſe are ſuch as the Dutch chaſers, or divers, catch from June to the 15th of July. Theſe are ſold away in ſea-ſticks, to be ſpent preſently, in regard to their fatneſs; becauſe they will not endure repacking. They go one with another, full and ſhotten; but the repacked herrings are ſorted, the full herrings by themſelves.

3. The *ſhotten* and *ſick* herrings by themſelves; the barrel whereof is to be marked diſtinctly.

4. *Crux herrings;* which are ſuch as are caught after the 14th of September. Theſe are cured with that kind of ſalt called ſalt upon ſalt, and are carefully ſorted out, all full herrings, and uſed in repacking.

5. *Corved herrings.* Theſe ſerve to make red herrings, being ſuch as are taken in the Yarmouth ſeas, from the end of Auguſt to the middle of October; provided they can be carried aſhore within a week, more or leſs, after they are taken. Theſe are never gipped, but rowed in ſalt, for the better preſerving of them, till they can be brought on ſhore; and ſuch as are kept to make red herrings, are waſhed in great vats in freſh water before they are hung up in the *herring hangs*, or *red-herring* houſes.

As for the *manner of ſalting herrings;* the nets being haled on board, the fiſhes are taken out, and put into the warbacks, which ſtand on one ſide of the veſſels. When all the nets are thus unloaded, one fills the gippers baſkets. The gippers cut their throats, take out their guts, and fling out the full herrings into one baſket, and the ſhotten into another. One man takes the full baſket when they are gipped, and carries them to the rower-back, wherein there is ſalt. One boy rows and ſtirs them about in the ſalt, and another takes them, thus rowed, and carries them in baſkets to the packers. Four men pack the herrings into one barrel, and lay them, one by one, ſtraight and even; and another man, when the barrel is full, takes it from the packers. It is left to ſtand a day or more open to ſettle, that the ſalt may melt and diſſolve to pickle; after which it is filled up, and the barrel headed. The pickle is to be ſtrong enough to ſuſtain a herring; otherwiſe the fiſh decay in it. See *Herring* FISHERY.

It is unlawful to buy or ſell herrings at ſea, before the fiſhermen come into the haven, and the cable of the ſhip be drawn to the land, 31 Edw. III. ſtat. 2. No herring ſhall be ſold in any veſſel, but where the barrel contains 32 gallons, and half-barrel and firkin accordingly; and they muſt be well packed, of one time's packing and ſalting, and be as good at the middle as the ends, on the pain of forfeiting 3*s.* 4*d.* a barrel, &c. by ſtat. 22 Edw. IV. cap. 2. The veſſels for herrings are to be marked with the quantity, and place where packed, and packers to be appointed and ſworn in all fiſhing-ports, &c. under the penalty of 100*l.* ſtat. 15 Car. II. cap. 16. (For other regulations, ſee *Herring* FISHERY.) Freſh herrings, conſidered as a food, are ſaid to be very good aliment, if uſed moderately; but if taken in quantities diſproportioned to the powers of digeſtion, they produce a putrefaction in the ſtomach of the alkaline kind, and are attended with all the bad conſequences of highly alcaleſcent aliment: but pickled herrings are very bad aliment, the fleſh being rendered hard, and ſcarcely digeſtible by the vital powers: theſe, however, are leſs injurious than thoſe which are ſalted and dried.

HERRING-*buſs*, a veſſel uſed in the herring-fiſhery. See BUSS and FISHERY.

HERRING-*cob* is a young herring. See *Herring* FISHERY.

HERRING-*fiſhery*. See *Herring* FISHERY.

HERRING-*gull*, in *Ornithology*, the name of a bird of the larus kind, called by authors *larus cinereus maximus*, or the great grey gull, and by Linnæus the LARUS *Fuſcus;* which ſee.

HERRING-*ſcales*, in *Agriculture*, the ſcales and other refuſe which are collected in the various places where herrings are cured, and which are found to be highly beneficial as a manure. It has been long ſince ſuggeſted by Mr. Young, that, in addition to other ſorts of manure, the farmers about Leoſtoff employ herring-ſcales. The herrings are waſhed in large tubs before they undergo the operation of ſmoking, and ſuch ſcales as come off in the proceſs are diſpoſed of to the farmers at about ſixpence the laſt, which are the ſcales of 10,000 herrings. The manner of uſing ſcales of this ſort is that of ſowing them upon wheat on clover lays, having them harrowed in with the corn, from which management conſiderable benefit is ſuppoſed to be derived. And it is ſuggeſted, that an additional advantage might probably be drawn from the uſe of the water in which the herrings have been waſhed, as it is found to be oily, bloody, and ſtrongly impregnated with the ſmell of the fiſh. It is hinted that this water might be received into reſervoirs, contrived at but little expence; from which it might occaſionally be drawn off, and conveyed in watering carts, ſimilar to thoſe employed in the roads near the metropolis, either directly to the grounds which are in a proper ſtate of preparation for its reception, or to a heap of earthy materials, which are deſigned to be formed into compoſt. Turf or ſods are particularly adapted to this purpoſe, from their quality of readily abſorbing the moiſture. Dung may be afterwards added with the beſt effect.

It is, however, confeſſed, that the probability of advantage being derived from the employment of ſuch water, is founded ſolely upon that of the uſe of the ſcales as ſtated above; yet if, upon the authority of the Leoſtoff farmers, the utility of the practice be admitted, the preſumption is greatly in favour of the ſuggeſtion which has been already ſubmitted to the conſideration of the experimental farmer reſiding in the neighbourhood of a fiſhing town. But, before any great expence may be incurred, a ſmall open ſpot of ground, which is equally good in every part, ſhould be appropriated to the trial; of which, if one-half ſhould receive a common dreſſing, and the other this kind of application from a watering-pot or other ſimilar means, the produce

of the different portions will plainly ſhew the reſpective merits of each, and in ſome meaſure demonſtrate what degree of regard ought to be paid to the latter material when uſed in this way.

There are ſeveral other deſcriptions of fiſh refuſe that might, in all probability, be employed in the way of manure with great benefit, if ſufficient care was taken in the collecting and applying of them. See MANURE.

HERRING-*ſilver*, a compoſition in money, formerly paid in lieu of a certain quantity of herrings for the proviſion of a religious houſe.

HERRING *Bay*, in *Geography*, a bay of America, on the W. ſide of Cheſapeak bay, Maryland, 26 miles S. of Annapolis; which derives its name from the herrings that frequent it.

HERRING *Pond Indians*. See SANDWICH.

HERRIOT. See HERIOT.

HERRIOT, in *Geography*, a town of Scotland, in the county of Edinburgh; 10 miles S. of Dalkeith.

HERRISON. See HERISSON.

HERRNHUTERS, in *Eccleſiaſtical Hiſtory*, the name of a fanatical ſect, called alſo Moravians, which ſprung up in Upper Luſatia towards the beginning of the laſt century, This ſect was founded by Nicholas Lewis, count of Zinzendorf; and to his activity and zeal the progreſs of it is to be aſcribed. According to the account which he gives of himſelf, he had formed a deſign, when only 10 years old, of collecting a ſmall ſociety of *believers*, who ſhould altogether employ themſelves in exerciſes of devotion, under his direction. Accordingly, when he became of age, in the year 1721, he ſettled at Bertholſdorf, a village in Upper Luſatia, where he was ſoon joined by a number of proſelytes from Moravia; ſo that in a few years Bertholſdorf became a conſiderable village, having an orphan-houſe, and other public buildings. In 1728, thirty-four new houſes were erected; and in 1732 the number of inhabitants amounted to ſix hundred. From the name of a hill in the neighbourhood of this village, called the Huth-berg, theſe coloniſts gave their dwelling place the appellation of *Huth des Herrn*, and afterwards *Herrnhuth*, ſignifying the guard or protection of the Lord; whence aroſe the denomination of their ſect. As their number increaſed, Zinzendorf eſtabliſhed a peculiar diſcipline; dividing his adherents into different claſſes of married men, married women, widowers, widows, maids, bachelors, and children; each claſs being under the inſpection of a director, choſen by its members; and the claſſes are alſo ſubject to the ſuperintendence of an elder, co-elder, and vice-elder. Particular attention was paid by theſe ſeveral claſſes to the inſtruction of youth; and as a great part of their worſhip conſiſted in ſinging, they pretended that children were inſtructed in their religion by hymns. There are ſome perſons of both ſexes appointed by rotation to pray for the ſociety, who are admoniſhed of their duty by an inward feeling; and they pretend to determine the divine will in particular caſes by caſting lots. All matrimonial contracts are ſubject to the direction and approbation of the elders. This ſect profeſſed, in their firſt eſtabliſhment, to belong to the Lutheran church; but count Zinzendorf, for the greater credit of this new ſociety, afterwards pretended that it was a revival of the ancient Moravian church, or Bohemian brethren, who were converted from popery by John Huſs. Such was the origin of a ſect, which in proceſs of time became very conſiderable and extenſive, and which adopted a variety of ſingular tenets aod practices. Zinzendorf was denominated the truſtee and guardian of the brethren; in 1737 he was conſecrated biſhop of this ſect, a dignity which he reſigned in 1740. Towards the cloſe of the year 1744 he was denominated miniſter plenipotentiary and economiſt; and it was enacted that nothing of importance ſhould be done without his conſent; and he afterwards ſtyled himſelf the lord advocate of the *unitas fratrum*. Zinzendorf travelled in perſon all over Europe, and was twice in America; and he has alſo ſent miſſionaries almoſt throughout the known world. It would be endleſs to recount the numberleſs attempts which this zealot has made uſe of to eſtabliſh his own authority, and to extend the intereſt of his party. According to his own account, publiſhed in 1749, the ſociety had almoſt a thouſand labourers diſperſed all over the world, who preached in 14 languages, and 98 different eſtabliſhments, among which are caſtles, that have 20, 50, or 90 apartments. How far this account is juſtified by fact we cannot pretend to determine; but it is certain that the decline of this ſect has been no leſs ſignal and rapid than its progreſs. With regard to the tenets of the Herrnhuters, it may be obſerved, that at their firſt riſe they profeſſed to admit the confeſſion of Augſburg, and count Zinzendorf has always referred to his confeſſion as the ſtandard of his doctrine. However, it is well known that he has advanced very different notions, and recommended very unwarrantable practices; notions and practices which ſome have thought to diſfigure the ſacred truths of the goſpel, and ſap the foundations of morality. The count himſelf ſpeaks in very derogating terms of the ſcripture, and expreſsly aſſerts, that the reading of the ſcripture appears to him to be more dangerous than uſeful to the ſociety. To avoid idolatry, he ſays, people ought to be taken from the Father and Holy Ghoſt, and conducted to Chriſt, with whom alone we have to do. The Holy Ghoſt is called by the Herrnhuters the eternal wife of God, the mother of Chriſt, the mother of the faithful, and of the church. The language of their devotion has been charged with obſcenity: and it has been ſaid that the ideas excited by it are ſuch as no chaſte mind can entertain. The conjugal act is a piece of ſcenery in which the male repreſents Chriſt the huſband of ſouls, and the female the church; and they have actually appointed ceremonies, in the celebration of marriage, which have been repreſented as indecent. Count Zinzendorf expreſsly declares, that the law is not a rule of life to a believer; that the moral law belongs only to the Jews, and that a converted perſon cannot ſin againſt light. It has been ſaid, that no example can be found of a fanaticiſm more extravagant, and a myſticiſm more reproachful than thoſe of the Herrnhuters. Thoſe whoſe curioſity leads them to ſeek for farther information, may conſult Moſheim's Eccl. Hiſt. vol. v. p. 85, note (*s*). Warburton's Doctrine of Grace, vol. ii. p. 153. and Rimius's Candid Narrative of the Riſe and Progreſs of the Herrnhuters, commonly called Moravians, or Unitas Fratrum, &c. 1753, and Supplement, &c. publiſhed in 1755. In juſtice to thoſe who diſavow the opinions and practices charged upon the Herrnhuters, by theſe authors, an account of this ſect, extracted from their own writings, will be given under UNITAS *Fratrum*.

HERRNHUTH, or HERNHUTT, in *Geography*, a town or village of Luſatia, and principality of Gorlitz; founded, in the year 1721, by ſome Moravian brethren; 6 miles N. of Zittau. See HERRNHUTERS.

HERRNHUTT, NEW, a Moravian town or ſettlement in Greenland. See GREENLAND.

HERRNSTADT, a town of Sileſia, in the principality

lity of Wolau; 25 miles E. of Glogau. N. lat. 51° 33'. E. long. 16° 43'.

HERRNWERTH, or HERRN *Chiemſee*, a town of Bavaria, the ſee of a biſhop, founded, in 1215, by Everhard II., archbiſhop of Salzburg; 27 miles W. of Salzburg.

HERRSBRUCK, a town of Germany, in the territory of Nuremberg, ſituated on the Pregnitz, containing about 226 houſes; 15 miles E. of Nuremberg. N. lat. 49° 28'. E. long. 11° 24'.

HERSCHEL, JACOB, in *Biography*, brother of our great aſtronomer, and maſter of the king's band at Hanover, was an excellent inſtrumental compoſer, in the beſt taſte of Germany at the time, which was more ſerious and ſimple than the preſent, and more reſembled that of Abel than Haydn. We have ſeen only one ſet of his ſonatas for two violins and a baſe, printed in England by Bremner, which are extremely pleaſing; but he left behind him many compoſitions of a higher claſs; and ſons able to execute them, or any muſic that may be ſet before them.

Jacob Herſchel died the third of June, 1792, in the fifty-eighth year of his age.

HERSCHEL, in *Aſtronomy*, a name given by the French and moſt other European nations to the new planet diſcovered by Dr. Herſchel in the year 1781. Its mark or character is ♅. The Italians call it Ouranos or Urania, but the Engliſh denominate it the GEORGIAN *Planet*; which ſee.

HERSE, in *Fortification*, a lattice, or portcullice, in form of a harrow, beſet with iron ſpikes. See PORTCULLICE.

The word *herſe* is French, and literally ſignifies *harrow*; being formed of the Latin *herpex*, or *irpex*; which denote the ſame.

It is uſually hung by a rope faſtened to a moulinet; to be cut, in caſe of ſurprize, or when the firſt gate is broken with a petard; that the herſe may fall, and ſtop up the paſſage of the gate or entrance of the fortreſs.

The herſe is otherwiſe called a *ſarraſin*, or *cataract*; and when it conſiſts of ſtraight ſtakes, without any croſs pieces, it is called *orgues*; which ſee.

HERSE is alſo a harrow, which the beſieged, for want of chevaux de friſe, lay either in the way, or in breaches, with the points up, to incommode the march as well of the horſe as the infantry.

HERSE, in *Mythology*, the daughter of Cecrops, beloved of Mercury. She had a temple at Athens.

HERSENT, or HERSANT, in *Biography*, a French divine, who flouriſhed in the ſeventeenth century, brought himſelf into trouble by a book entitled "Optatus Gallus de cavendo Schiſmate," in which he charged cardinal Richlieu with views inimical to the Gallican church. He quitted France and retired to Rome, where he was excommunicated for advancing ſome peculiar notions on grace. He died in 1680. He was author of a paraphraſe on Solomon's Song, and other works. Moreri.

HERSFELD, or HIRSCHFELD, in *Geography*, a town of Germany, and capital of a principality of the ſame name, belonging to the houſe of Heſſe Caſſel; ſurrounded with walls; flanked with towers, and containing about five hundred houſes, a chateau, a public ſeminary, a rich hoſpital, and a ſpring of medicinal water; 32 miles S.S.E. of Caſſel. N. lat. 50° 55'. E. long. 9° 40'.

HERSILIA, in *Mythology*, the wife of Romulus, received the ſame honours with her huſband, and was revered under the name of "Herta," or the goddeſs of youth.

HERSILLON, in the *Military Art*, a ſort of plank, or beam, ten or twelve feet long, whoſe two ſides are driven full of ſpikes, or nails, to incommode the march of the infantry or cavalry.

The word is a diminutive of herſe; the herſillon doing the office of a little herſe.

HERSIPHORIA. See ARRHEPHORIA.

HERSOU-TOUKA, in *Geography*, a town of Chineſe Tartary. N. lat. 43° 26'. E. long. 124° 29'.

HERSTAL, or HERISTAL, a town of France, in the department of the Ourthe, ſeated on the Meuſe, with a caſtle which belonged to Pepin, father to Charles Martel, ſold to the king of Pruſſia in 1741; 4 miles N. of Liege.

HERSTEIN, a town of France, in the department of the Saône. The place contains 408, and the canton 8011 inhabitants, in 38 communes.

HERTFORD, a borough and market-town, in the county of the ſame name, in England, is of conſiderable antiquity, but of uncertain origin; though it is known to have attained importance very early in the Saxon times; and a ſynod is recorded to have been held here either in the year 670 or 673. Its ſituation, on the Ermin ſtreet, and on a ford of the river Lea, is ſuppoſed to have occaſioned its preſent name, which is thought to be a corruption from *Here-ford*, that is, the *Army's-ford*: this etymology is confirmed by the name of the town being written Hereford by Saxon authors and in ancient charters. A caſtle was built here, by Edward the Elder, about the year 909: he is alſo recorded to have built and fortified the town, which had probably been wholly deſpoiled and ruined by the Danes. At the time of the Domeſday ſurvey, Hertford contained 146 burgeſſes, and had two churches: the lands and houſes were then divided between the king and eight of his principal officers, among whom was Peter de Valoines, who had been conſtituted governor of Hertford caſtle, and was afterwards confirmed in that poſt by Henry I. In the reign of Henry III. the caſtle was bravely defended by ſir Walter de Godarvil, then governor, againſt the dauphin and the confederate barons, during a ſiege of four weeks, but at length was ſurrendered on honourable terms. The caſtle was frequently a royal reſidence; in 1345, Edward III., having created his fourth ſon, John of Gaunt, earl of Richmond, granted him the honor, caſtle, and town of Hertford, as a place where he might be "lodged and accommodated in a manner ſuitable to his dignity: while it was in his poſſeſſion, it was the occaſional dwelling-place of the two illuſtrious priſoners, John, king of France, and David, king of the Scots. Henry, duke of Lancaſter, kept his court here at the time of king Richard's depoſition; and on the duke's aſſumption of the throne, he ſettled the town and caſtle on his queen for life. The honour was afterwards beſtowed on Catharine of France, queen of Henry V. Henry VI. kept his court in the caſtle in his ſeventh year, and the honour was afterwards ſettled on his queen, Margaret of Anjou. In ſeveral ſubſequent reigns we find frequent teſtimonials of the importance of the town and caſtle. Very few remains of the original fortreſs are now ſtanding, and theſe are principally confined to the outer walls, which ſhow parts of one round, and ſome angular towers." The preſent body is chiefly of brick, and apparently of the time of James or Charles I., except the tower, which is of greater antiquity. The walls have been ſurrounded by a deep moat, ſupplied with water from the river Lea, which flows under the north ſide.

Nume-

Numerous privileges and immunities have been granted to Hertford by various ſovereigns, ſince the time of the Conqueror, who firſt incorporated the borough by charter. The civil government was originally veſted in a chief bailiff, an under bailiff, and other officers; but this form, after being altered ſeveral times, was abrogated by James I., and the juriſdiction committed to a mayor and common council. Charles II., by letters patent dated 1680, veſted the corporation in a mayor, recorder, ten aldermen, a chamberlain, ſixteen aſſiſtants, and other officers; and under this charter the borough is now governed. The earlieſt return of members to parliament was in the twenty-ſixth of Edward I.; but, after the fiftieth of Edward III., no return appears to have been made till the twenty-firſt of James I., when the privilege was reſtored on a petition from the corporation. The right of election is in the inhabitant houſeholders, reſident freemen, &c.; the number of voters is about 580. The burgeſſes were formerly obliged to furniſh one man, completely armed, to attend the king in any warlike expedition.

Hertford had formerly five churches; four parochial, and one belonging to the priory: but only two are now ſtanding, reſpectively dedicated to All Saints, and St. Andrew. All Saints, the principal church, is a large edifice, ſituated in the ſouth-eaſt part of the town, and conſiſting of a nave, chancel, and ſide aiſles, with a low tower and ſpire. The monuments are numerous: one of the moſt ancient is a ſlab at the eaſt end of the ſouth ſide, to the memory of John Hunger, eſq. formerly maſter cook to queen Catherine; he died in 1435: among the modern inſcriptions is a long one in honour of ſir John Harriſon of Balls, who died in 1669. In St. Andrew's church, which ſtands on the north ſide of the Lea, are likewiſe many ſepulchral memorials for different families. The priory, which ſtood in the eaſt part of the town, and on the ſcite of which a good modern houſe has been erected, was founded, for Benedictine monks, by Ralph de Limeſey, who had lands in this town granted to him by the Conqueror.

Hertford is a healthy, reſpectable, and improving town: the ſeſſions, and market-houſe, and the town-hall, were rebuilt about 1770, and are handſome brick-edifices. The blue coat ſchool, connected with Chriſt hoſpital, London, is a large building at the eaſt end of the town, forming three ſides of a quadrangle: it contains ſufficient accommodations for upwards of 500 children; and about that number is now reſident. In this town is alſo a grammar ſchool, which was originally founded and endowed by Richard Hale, eſq. of King's Walden, in the time of James I. Since that period, the ſchool-houſe had been rebuilt, and the endowments encreaſed by various benefactors. Among other donations, Bernard Hale, eſq. gave 100*l. per annum*, for eſtabliſhing ſeven ſcholarſhips at Peter Houſe, Cambridge, for boys educated on this foundation. The number of inhabitants in Hertford, including the blue coat ſchool diſtrict, as returned under the act of 1801, amounted to 3360; of whom 1762 were males, and 1598 females: the number of houſes was 542. Hertford is 21 miles diſtant from London. In this town has recently been erected a large, handſome building, called Hertford college, for the reception and accommodation of ſeveral gentlemen, qualified to inſtruct youth in various branches of uſeful knowledge, and alſo for ſeveral young men, or ſtudents, deſtined for the Eaſt India ſervice. The building is from deſigns by Mr. Wilkins, and the ſcholaſtic eſtabliſhment is under the maſterſhip of the Rev. Samuel Henley. This inſtitution is of too important a nature to be paſſed over, or merely noticed in a brief manner. From its national character and highly uſeful tendency, it will be expedient to give a detailed account of its origin, eſtabliſhment, and purport. The aſſociated merchants, &c. of London, generally known by the name of the Eaſt India company, having thought it neceſſary to inſtruct a number of young men expreſsly for their ſervice in the Eaſt Indies, inſtituted, in April 1805, a college for this purpoſe; and very ſhortly afterwards a ſpot was fixed on, and contracts made with Mr. Wilkins, the architect, to erect a ſuitable edifice: the firſt ſtone of which was laid on the 12th of May 1806, at Haileybury, in the pariſh of Amwell, near Hertford, and at the diſtance of 19 miles from the metropolis. This edifice is now completed, (1811), and in its exterior ſtyle of compoſition and interior arrangement, and appropriation, is highly creditable to the taſte and ſcience of the artiſt. Its ſituation is alſo peculiarly eligible, from the ſalubrity of the air, and pleaſantneſs of the ſurrounding country. The building will contain and accommodate 100 ſtudents, beſides maſters, and neceſſary attendants. About 30 of theſe ſtudents are annually drawn off for India. By the ſtatutes of the college, ſtudents are to be admitted on the completion of their 15th year, and remain here till the age of 18, or till the court of directors ſhall ſend them to their reſpective deſtinations. A nomination to the college on the part of the court is equivalent to an immediate appointment, provided the advantages be not forfeited by the ſtudents. The ſcholars are inſtructed by courſes of lectures, much on the plan purſued in the univerſities.

This inſtitution is under the direction and authority of a principal and ſeveral profeſſors, who conſtitute the college-council. The preſent officers are;—principal, the Rev. Samuel Henley, D. D. F. S. A.—Profeſſors of mathematics and natural philoſopher, the Rev. Bewick Bridge, B. D. the Rev. William Dealtry, A. M. F. R. S.—Profeſſors of claſſical and general literature, the Rev. Edward Lewton, A. M. the Rev. Joſeph Hallet Batten, A. M.—Profeſſor of hiſtory and political economy, the Rev. Thomas Robert Malthus, A. M.—Profeſſor of general polity and the laws of England, Edward Chriſtian, eſq. A. M.—Profeſſor of Arabic, Perſian, and Hindûſtanni, Charles Stewart, eſq.—Profeſſor of Hindû literature, and of the hiſtory of Aſia, Alexander Hamilton, eſq.—Aſſiſtants in the Oriental department, Moolvy Abd al Aly; Moolvy Mirza Kheleel.—Perſian writing-maſter, Moonſhy Ghoolam Hyder.—Viſitor and counſellor in the Oriental department, Charles Wilkins, eſq. F. R. S. L. L. D.—Regiſtrar and deputy librarian, Robert Bellew, eſq.—Maſters attached to the college, M. de Foligny, for French; Mr. Thomas Medland, for drawing; Mr. Henry Angelo, for fencing.—Beſides the general ſuperintendance of the college, it is the office of the principal, more eſpecially, to watch over the moral and religious conduct of the ſtudents; to inſtruct them in the principles of ethics and natural theology, and in the evidences, doctrines, and duties of revealed religion. Whilſt, in this reſpect, he diſcharges the duty of a profeſſor in divinity, ſo, in the exerciſe of his clerical function, he takes his turn, in conjunction with ſuch profeſſors as are in holy orders, to preach in the college chapel, and at the ſtated ſeaſons to perform the ſolemnities of the eſtabliſhed church. The office of dean, which is held by a clerical member of the college-council, by annual appointment, is to aſſiſt the principal in the ſuperintendance of the college. The librarian is alſo a member of the ſame body by annual appointment. The courſes of lectures of the profeſſors are arranged under four diſtinct heads. I. Oriental literature. 1. Practical inſtruction in the rudiments of the Oriental languages, eſpecially the Arabic, Perſian, and Hindûſtanni, together with the Sanſcrit and Bengalee-

Bengalee. 2. A courſe to illuſtrate the hiſtory, cuſtoms, and manners of the people of India.—II. Mathematics and natural philoſophy. 1. A courſe of practical inſtruction, in the elements of Euclid, algebra, and trigonometry; on the moſt uſeful properties of the conic ſections, the nature of logarithms, and the principles of fluxions. 2. A courſe of lectures on the four branches of natural philoſophy; mechanics, hydroſtatics, optics, and aſtronomy; with elementary inſtructions in chemiſtry, mineralogy, and natural hiſtory.—III. Claſſical and general literature. 1. A courſe of lectures to explain the ancient writers of Rome and Greece, more particularly the hiſtorians and orators. 2. A courſe of lectures on the arts of reaſoning and compoſition, and ſuch ſubjects as are generally underſtood by the "belles lettres." The Engliſh language, and the merits of its moſt approved writers, are prominent objects in theſe lectures. The ſtudents in this department are exerciſed in ſuch ſpecies of compoſition as are appropriate to their future occupations. —IV. Law, hiſtory, and political economy. 1. A courſe of lectures on general polity, on the laws of England and the principles of the Britiſh conſtitution. 2. A courſe of lectures on general hiſtory, and on the hiſtory and ſtatiſtics of the modern nations of Europe. 3. On political economy. The whole of theſe inſtructions are as plain and practical as their different ſubjects will admit. The college year is divided into two terms of forty weeks each, with a ſummer vacation of eight weeks, and a winter vacation of four weeks. The principal examination extends through the laſt three weeks previous to the winter vacation, and is cloſed by a viſitation of the court of directors, when the reſult of the examination is publiſhed by the principal in ſeparate liſts for each department of the reſpective merits of every ſtudent; which liſts are inſerted in the public records of the company. A ſeparate liſt exhibits a relative view of the conduct and proficiency of each ſtudent. Prizes of books, gold medals, and certificates of ſuperior merit, with other marks of academical diſtinctions, are publicly conferred by the chairman: and every ſtudent on going to India carries with him a certificate, under the college ſeal, ſpecifying the attainments he has made during his academical courſe. Further particulars relative to this college, college-ſchool, (which is now fixed in Hertford caſtle,) and other inſtitutions of the company, for the purpoſe of military education, may be found in the Eaſt India Regiſter for 1811.

Among the ſeats in the vicinity of Hertford is Balls, the property of the marquis Townſhend, to whom it was bequeathed by Etheldreda, daughter and heireſs of Edward Harriſon, eſq. and wife of Charles, lord viſcount Townſhend, grandfather to the preſent marquis. The houſe was built in the time of Charles I. by ſir John Harriſon, knight, who, lies buried in All Saints church. Adjoining to Balls, on the ſouth, is Brickenden Bury, the ſeat of — Morgan, eſq.

Hertford, a county of America, in Edenton diſtrict, North Carolina, containing 6448 inhabitants, of whom 2733 are ſlaves: the chief town is Wynton.—Alſo, a poſt-town of N. Carolina, in Edenton diſtrict, and capital of the county of Gates; containing about 20 houſes, a court-houſe, and gaol; 18 miles N.N.E. of Edenton.

HERTFORDSHIRE, a midland county of England, is ſurrounded by Middleſex, Buckinghamſhire, Bedfordſhire, Cambridgeſhire, and Eſſex. Its limits are principally artificial, excepting on the ſouth-eaſt, where it is ſeparated from Eſſex by the rivers Lea and Stort.

Previous to the Roman invaſion, this diſtrict was chiefly poſſeſſed by the Caſſi, or Catieuchlani; whoſe ſovereign, Caſſivelaunus, was choſen to lead the aſſociated Britons againſt the Romans, and is thought to have had a principal reſidence, or city, at Verulam, which was at that period a ſtrong ſituation, contiguous to the modern St. Albans, and was afterwards advanced to the rank of a municipium. On the ſubjugation of the ſouthern parts of Britain by the Romans, Hertfordſhire was included in the diſtrict named Flavia Cæſarienſis; but after the conqueſt of the iſland by the Saxons, this county was divided between the Eaſt Saxon and Mercian kingdoms. The principal Roman ſtations, either in or connected with this country, were Durocobrivis; Verulamium, or Verulam; and Sullonicæ, or Brockley hills, the latter, however, are chiefly in Middleſex: that the Romans had other, though probably leſs important ſtations within its limits, is evinced by remains that are yet diſcoverable, or by antiquities that have formerly been found. The principal ancient roads which interſected Hertfordſhire, were the Watling-ſtreet, the Icknild-way, and the Irming, or Ermin-ſtreet.

Hertfordſhire extends in its longeſt direction thirty-ſix miles; its general breadth is about twenty-ſix miles; and its circumference between 130 and 140 miles. Its ſuperficies, according to Halley, includes 451,000 acres; yet this appears to be rather an exaggerated meaſurement, and if the ſtatement be limited to 385,000, it will probably be more accurate. The county is divided into eight hundreds, which contain two boroughs, ſeventeen other market towns, and 134 pariſhes: the number of houſes, according to the population return in 1801, amounted to 18,172; that of inhabitants to 97,577; of whom 48,063 were males, and 49,514 females. The repreſentatives in parliament are ſix: of which number two are for the ſhire, two for the borough of Hertford, and two for that of St. Albans.

The ſurface of the county is diverſified ſufficiently to conſtitute a conſiderable variety of pictureſque ſcenery. The northern parts are the moſt hilly; and a range of high grounds ſtretches out from the neighbourhood of King's Langley towards Berkhampſtead and Tring, and in many parts commands a great extent of country. Another elevated ridge commences at St. Albans, and extends in a northerly direction towards Market-ſtreet, at a little diſtance to the eaſt of the high northern road; while ſeveral other ranges of elevated ground run nearly parallel with the former from the vicinity of Sandridge, Whethampſtead, Whitwell, &c. The ſouthern line is alſo high enough to include ſome extenſive proſpects. Moſt of the county is incloſed; and the incloſures, being principally live hedges, intermixed with flouriſhing timber, have a verdant and pleaſing effect. Independently of the wood thus diſtributed in hedge-rows, large quantities of very fine timber are grown in the parks and grounds belonging to the numerous ſeats of the nobility and gentry, that are ſpread over almoſt every part of the county.

The landed property is greatly divided; the vicinity of the capital, the goodneſs of the air and roads, and the beauty of the country, have much contributed to this circumſtance, by making this county a favourite reſidence, and by attracting great numbers of wealthy perſons to purchaſe lands for building villas; this has multiplied eſtates in a manner unknown in the diſtant counties. Freehold eſtates have of late ſold at twenty-five and twenty-eight years purchaſe; and under particular circumſtances ſome very large tracts have obtained from thirty to thirty-two years purchaſe. The largeſt eſtate in the county is about the annual value of 7000*l.* Several others are averaged at from 3000 to 4000*l.*, more at 2000*l.*; and below that ſum, they may be met with of almoſt every amount. A large portion of the county is held by copyhold tenure, with a fine certain, or

or at the will of the lord: but which fine ſeldom exceed two years rent. Land thus held, ſells at about ſix years purchaſe under the price of freehold. The common extent of farms is from 150 to 400 acres; though there are many much ſmaller; ſeveral contain from 400 to 700 acres; and a few from 800 to 1000 acres. The largeſt farms are, in general, the beſt managed and moſt productive; the opinion is common, that the land cannot be kept in a degree of fertility requiſite to ſupport the rental and other expences, without bringing large quantities of manure from the capital; a buſineſs not ſufficiently practiſed on ſmall farms. The average of rent per acre is about 15*s.* ſubject to tythe, which is compounded for through the whole county. The prevailing ſoils are loam and clay; the former is met with in almoſt all its gradations, and is more or leſs intermingled with flints or ſand. The vales, through which the rivers and brooks take their courſe, are compoſed of a rich ſandy loam, with the exception of a ſmall quantity of peat and marſhy moor; the ſlopes of the hills deſcending to thoſe vales, exhibit inferior ſorts of the ſame loams; but the flatter ſurfaces of the higher grounds, are compoſed of a wet and ſtrong loam of a reddiſh hue, and tending in a greater or leſs degree to clay, by which term, it is frequently, though improperly denominated. Round St. Albans, and extending to Watford and Rickmanſworth, the ſoil is principally compoſed of deep flinty loam, with a chalk baſis. Chalk prevails generally on the northern ſide of the county; and extends from the neighbourhood of Barkway and Royſton, through all the contiguous pariſhes to Baldock, Hitchin, King's Walden, &c. The baſis, indeed, of the whole county is chalk, either more or leſs pure; though the depths at which it is found are very different. In the ſouth-weſt corner of the county, and particularly in the pariſhes of Rickmanſworth, Sarret, King's Langley, Abbot's Langley, Flaunden, Bovington, and partly in Watford and Aldenham, are many orchards: apples and cherries are their principal produce. The woodlands are extenſive; and, independently of thoſe which lie contiguous to the ſeats of gentlemen, the whole county is interſperſed with ſmall woods and copſes. The principal roads are very good; being chiefly turnpike, leading directly from the metropolis: the croſs-roads partake of a ſimilar character. The chief manufactures of the county are thoſe of cotton and ſilk; the former is principally carried on in the neighbourhood of St. Alban's and Rickmanſworth; the latter, in the vicinity of St. Alban's and Watford. About Berkhampſtead, black lace is made; but the principal employment of the labouring females, in moſt parts of the county, is plaiting of ſtraw, for bonnets, &c. The wages obtained by this employ are conſiderable; even young girls earn from ſix ſhillings to twelve or fifteen weekly; and the more expert women from that ſum to a guinea, or even twenty-five ſhillings.

The Grand Junction Canal interſects the weſtern ſide of the county; it enters on the ſouth from Middleſex, and paſſes into Buckinghamſhire about two miles above Tring.

The principal rivers in Hertfordſhire, are the Lea, the Rib, the Quin, the Beane, the Gade, the Colne, the Ver or Meuſe, and the Mimeram or Maran. The Lea riſes near Luton in Bedfordſhire; enters this county at Hide Mill, and finally quits it near Waltham-Abbey. This river is navigable to Ware and Hertford. The Rib has its riſe near Cornybury above Buntingford; and falls into the Lea between Hertford and Ware. The Beane riſes near Cromer, flows through Woodhall Park, and meets with the Lea at Hertford. The Colne is formed by the union of ſeveral ſmall ſtreams; theſe unite in the vicinity of North Mims. The New River, a fine ſtream, running in an artificial channel, and ſupplying the greater part of the metropolis with water, has its ſource at the village of Amwell in this county. At this place ſeveral ſprings are collected into a large deep reſervoir, and by means of flood-gates an uniform and regular ſtream of water is conveyed into the channel. On a large ſtone are inſcriptions, ſtating that the courſe of the river is forty miles, and that it was opened in 1608. It was not carried to London till the year 1613. In its courſe to the metropolis it is conveyed acroſs two vallies, by means of lofty, artificial embankments, and at Iſlington it paſſes, in a ſubterraneous channel, for 200 yards. At Sadler's Wells it terminates in a large pool or reſervoir, where a great number of iron pipes branch off in different directions, to convey the water under ground, to various parts of the town. This great and important undertaking was almoſt wholly effected by one man, Mr. Hugh Middleton, citizen and goldſmith, who impoveriſhed himſelf in proſecuting the ſcheme. (See Brayley's "London and Middleſex, 8vo., 1810, &c.) Scott, in a poem, called "Amwell," thus characteriſes and deſcribes the New-River:

"——— From Chadwell's pool
To London's plains, the Cambrian artiſt brought
His ample aqueduct —— ———
——— Our mercenary ſtream,
No grandeur boaſting, here obſcurely glides
O'er graſſy lawns, or willow ſhades.
As through the human form, arterial tubes
Branch'd every way, minute and more minute,
The circulating ſanguine fluid extend;
So, pipes innumerable to peopled ſtreets,
Tranſmit the purchaſed wave."

HERTHA, or Herthus, in *Mythology*, a deity worſhipped by the ancient Germans. This is mentioned by Tacitus, in his book de Moribus Germanorum, cap. 40. Voſſius conjectures that this goddeſs was Cybele; but ſhe was more probably Terra, or the Earth (ſynonymous with Cybele); becauſe the Germans ſtill uſe the word *hert* for the earth, whence alſo the Engliſh *earth*. Some have ſuppoſed that Stone-henge was a temple conſecrated to the goddeſs Herta.

HERTHAMAN, in the *Materia Medica*, a name given by Avicenna and Serapion to the grain called *Zea*, uſed much in medicine in their time, and ſuppoſed to be of a middle nature between wheat and barley.

HERTIUS, John Nicholas, in *Biography*, was born, in 1651, at Oberklee, near Gieſſen. He was educated at Gieſſen, and afterwards became profeſſor of law and politics. He died in 1710. The king of Pruſſia had, a ſhort time previouſly to his death, offered him the poſts of privy-counſellor and chancellor. He was author of many eſteemed works, of which the principal are "Notitia Veteris Francorum Regni," containing an account of the early periods of the monarchy of the Franks to the reign of Lewis the pious; and "Commentationes et Opuſcula ad Hiſtoriam et Geographiam Antiquæ Germaniæ Spectantia." Moreri.

HERTZBERG, or Hirzberg, in *Geography*, a town of Saxony, 24 miles S. E. of Wittenberg. N. lat. 51° 42'. E. long. 13° 15'.—Alſo, a town of Pomerelia; 11 miles S. E. of Dantzic.

HERTZEWALT, a town of Pruſſia, in the province of Oberland; 9 miles N. E. of Biſchofswerder.

HERVES, a rich and flouriſhing town of France, in the department of the Ourthe, and chief place of a canton, in the diſtrict of Liege; 11 miles S. E. of Liege. The place contains 2,785, and the canton 10,599 inhabitants, on a territory of 57¼ kiliometres, in five communes.

HERVEY,

HERVEY, JAMES, in *Biography*, ſon of a clergyman at Harding-ſtone, in Northamptonſhire, was born in the year 1714, and educated at the grammar-ſchool of Northampton. He being intended for the church, was at a proper age removed to Lincoln college, Oxford. Here he became acquainted with ſome perſons, who, at that period, diſtinguiſhed themſelves by their great zeal for the primitive doctrines, as they ſuppoſed, of Chriſtianity, and who were afterwards denominated, "Methodiſts," and by their influence and example zealouſly attached himſelf to the intereſts of piety and learning. Beſides the uſual ſtudies of the place he learned anatomy of Dr. Keil; natural philoſophy from Dr. Derham's Phyſico and Aſtro-Theology, and for improvement in ſtyle and compoſition he paid particular attention to Mr. Spence's Eſſay on Pope's Odyſſey. In 1736, he became curate to his father, and afterwards removed to Biddeford in Devonſhire, where he obtained the warm eſteem of his pariſhioners. His ſtipend was in this place very ſmall, but by an annual ſubſcription among the inhabitants, his income was raiſed to about ſixty pounds a year. While Mr. Hervey was in this ſituation he planned his work, which has been very popular, entitled "Meditations among the Tombs, and Reflections in a Flower Garden;" this he publiſhed in the year 1746. In 1743 he was removed from that curacy, returned to his father, whom he afterwards ſucceeded in his livings of Weſton Flavel and Collingtree. In the exerciſe of his miniſterial duties he was moſt exemplary, preaching, not only on the Sundays, but in the evening of each Wedneſday, he catechiſed the children of his pariſh, and was regular in his paſtoral viſits. By theſe great labours he injured a weak conſtitution, and brought on a decline, which put an end to his valuable life on Chriſtmas-day 1758, when he was only in the forty-fifth year of his age. In 1755 he publiſhed his "Theron and Aſpaſia, or Dialogues and Letters on important Subjects," in three volumes; which are written in a popular ſtyle, and according to the Calviniſtic doctrines. He was author of ſeveral other works. The profits of his publications he devoted wholly to purpoſes of charity. Biog. Brit.

HERVEY, JOHN AUGUSTUS, third earl of Briſtol, was born in 1724, and was brought up to the navy, in which he ſerved while he was very young, and obtained the rank of lieutenant in the year 1744. About this time he married miſs Chudleigh, afterwards the celebrated ducheſs of Kingſton. In 1747 he was made poſt captain, and ſerved with high reputation in the Mediterranean. In 1771 he was made one of the lords of the admiralty, and in 1774 he ſucceeded his brother as earl of Briſtol. He died in 1779, and his titles deſcended to his brother, the biſhop of Derry. His lady, in 1768, obtained a deciſion in the Commons which annulled their marriage; but the ſentence was ſet aſide by the houſe of lords in 1771, and ſhe was afterwards indicted for, and convicted of bigamy.

HERVEY'S *Bay*, in *Geography*, a large bay on the N.E. coaſt of New Holland, ſo called by captain Cook, in honour of captain Hervey, between Sandy Cape and South Head. S. lat. 24 40'. W. long. 152° 35'.

HERVEY'S *Iſland*. See HARVEY'S *Iſland*.

HERVEY'S *Point*, a cape on the N. coaſt of the iſland of Egmont, or New Guernſey. S. lat. 10° 42'. E. long. 164° 5'.

HERULI, in *Ancient Geography*, a fierce people, whoſe migrations from the coaſt of the Euxine ſea to the banks of the Danube, and through the dark foreſts of Germany and Poland, it is difficult to purſue, even under the conduct of Zoſimus, Procopius, and Jornandes. Such was their barbarity that they diſdained the uſe of armour, and condemned their widows and aged parents not to ſurvive the loſs of their huſbands, or the decay of their ſtrength. According to Jornandes and Procopius, the Heruli were originally a Gothic nation. The former writer affirms that they firſt dwelt in Scandinavia, and, being expelled from thence by the Danes, they wandered eaſtward as far as the Palus Mæotis, and ſettled in that neighbourhood. Procopius repreſents them as, in ancient times, inhabiting the countries that lie beyond the Danube. Here they continued, making frequent irruptions into the empire, till the reign of the emperor Anaſtaſius, who ſucceeded Zeno in 491, when great numbers of them were cut off by the Lombards, and the reſt driven from their ancient habitations. A large body, having long migrated from one country to another, ſettled at laſt in that of the Rugians, the preſent Pomerania, which they found uninhabited. Some time after they removed into Dacia, beyond the Danube, where, being ill treated by the Gepidæ, they had recourſe to Anaſtaſius, who, in 511, allowed them to paſs the Danube and ſettle in Thrace, on condition of ſerving in the Roman armies when required. Many of them, being driven out of their own country by the Lombards, migrated farther weſtward, and, paſſing without moleſtation, through ſeveral barbarous nations, arrived at the ocean, and embarking, ſet ſail for Thule, or the peninſula of Scandinavia, where they ſettled. They were, as we have already obſerved, remarkably ferocious. They were alſo addicted to every kind of lewdneſs and debauchery; they adored the gods of the other Gothic nations, and, on ſome extraordinary occaſions, they appeaſed them with human ſacrifices. The Heruli firſt began to invade the empire about the year 526, in Valerian's reign, but were ſoon repulſed by his ſon Gallienus. Eleven years after this period, they paſſed from the Palus Mæotis to the Euxine ſea, with a fleet of 500 veſſels, under the conduct of one of their chiefs, and landed at Byzantium and Chryopolis, now Scutari. After ſuſtaining a defeat, they re-embarked, and returned before Byzantium; and having croſſed the Boſphorus, they ſurpriſed and pluadered the city of Cyzicus, with great part of Aſia, and the iſlands of Lemnos and Scyros in the Archipelago. Then they ſteered their courſe towards Greece, and beſieged and burnt Athens, Corinth, Sparta, and Argos; but, being compelled to retreat, they committed horrible devaſtations in Bœotia, Acarnania, Epirus, and Thrace. Having been defeated, with great loſs, by Gallienus, they, about two years afterwards, joined the Goths, and other northern nations, againſt the emperor Claudius, but were again defeated. In the fourth year of Dioclefian's reign (A.D. 287) they entered Gaul, and laid waſte the provinces bordering on the Rhine, but were totally defeated and diſperſed by Maximian. In the year 366, the third of Valentinian's reign, they ſerved in the Roman army on the Rhine; and about the year 370 they were attacked by Ermenric or Ermanaric, king of the Oſtrogoths, and obliged to pay a yearly tribute, and to ſupply his army with their youth, when required. They were afterwards ſubdued by Attila, and compoſed part of his army when he invaded Gaul. Upon the death of Attila, they recovered their ancient liberty; and, forming an alliance with the Romans, ſerved in their armies under commanders of their own nation, appointed by the emperor. When Odoacer conquered Italy, in 476, the Heruli, who then ſerved in the Roman armies, obtained lands in Italy. In the reign of the emperor Anaſtaſius, which began in 491, they made war on ſeveral barbarous nations, and ſubdued them; but being overthrown with great ſlaughter by the Lombards, many of them retired; and they were diſperſed among the Rugians, in Scandinavia, and in Thrace and Illyricum; thoſe who ſettled in theſe

latter countries oppreſſed and barbarouſly uſed the Romans among whom they lived, to whoſe aſſiſtance Anaſtaſius marched with his troops, and on this occaſion moſt of the Heruli were cut to pieces. Thoſe who eſcaped, promiſing to ſerve the empire as faithful ſubjects, were ſuffered to continue in the countries which had been formerly aſſigned for their habitation. Having murdered their own king, Juſtinian, at their requeſt, appointed a ſovereign for them; but, revolting from him, Juſtinian drove them, and alſo the Gepidæ, who eſpouſed their cauſe, out of the empire. But as they aſſiſted him in his war he was reconciled to them; and in his reign many of them became proſelytes to Chriſtianity; but the change of their religion made no change in their manners; for, according to Procopius, they were the moſt wicked, the moſt treacherous and avaricious, and the moſt addicted to drunkenneſs, and all kinds of lewdneſs and debauchery, of all nations. Soon after the death of Juſtinian, they were ſubdued by the Lombards, and lived partly ſubject to them, and partly to the neighbouring nations.

HERVORDEN. See HERFORD.

HERWART, JOHN GEORGE, in *Biography*, chancellor of Bavaria, who flouriſhed in the early part of the 17th century, is known for the following works: "Chronologia Nova et Vera," 1626; "Admiranda Ethicæ Theologicæ Myſteri propatata, de antiquiſſima veterum Nationum ſuperſtitione qua Lapis Magnes pro Deo habitus colebatur." 1624. Bayle.

HERY, THIERRY DE, an eminent French ſurgeon, of the 16th century, was born at Paris. He ſtudied ſurgery with great aſſiduity in the Hôtel-Dieu. He followed the armies of Francis I. during the war in Italy; but after the battle of Pavia, in February 1525, he went to Rome, and entered into the hoſpital of St. James, where he found numbers of patients lingering under the venereal diſeaſe, to which he had already devoted conſiderable attention. He was ſtruck with the method of Carpi, who by means of mercurial friction, and, by accurate and extenſive obſervation, brought that practice to a great degree of perfection. On his return to France, his knowledge and ſucceſs in the uſe of the friction ſoon acquired him a high reputation; and, having devoted himſelf principally to the treatment of this diſeaſe, he accumulated an immenſe fortune. Nor was he leſs eſteemed for the qualities of his heart, being a man of great benevolence and liberality, compaſſionate and attentive to the poor, and faithful in all the relations of private life. According to Devaux, he died on the 12th of May, 1599; but Ambroſe Paré affirms that he was not living in the year 1585. The only writing which he left is a work on the ſubject of the diſeaſe to which he chiefly directed his practice: "La Methode curatoire de la Maladie Venerienne," &c. Paris 1552, 1569, 1634, in 8vo. It is the firſt treatiſe written in French on that ſubject, and was chiefly compiled from the Italian works which had preceded it. Eloy Dict. Hiſt.

HERZBERG, in *Geography*, a town of Weſtphalia, in the principality of Grubenhagen, near the Hartz mountain, in which are manufactures of arms and iron tools; 14 miles S. of Goſlar.

HERZELE, a town of France, in the department of the Scheldt, and chief place of a canton, in the diſtrict of Audenarde. The place contains 1295, and the canton 15,210 inhabitants, on a territory of 100 kiliometres, in 16 communes.

HERZGOVINA, HERSEK, or *St. Saba*, a town of Dalmatia, giving name to a duchy, called alſo *Moſtar*, which ſee. It is fortified, and is the reſidence of a Turkiſh governor; but a great part of the duchy belongs to Italy; 80 miles S.S.W. of Belgrade. N. lat. 43° 30'. E. long. 18° 20'. The chief towns of the duchy are Narona, or Narenta, formerly the capital, Imos, Varboſania, Moſtar, and Klinova.

HESAUTTA, a town of Bengal; 24 miles north of Toree.

HESDIN, in *Geography*, a town of France, and ſeat of a tribunal, in the department of the Straits of Calais, ſituated on the Canche, built in the form of a regular hexagon, ſtrongly fortified, and almoſt ſurrounded with marſhes; 12 miles S.E. of Montreuil. N. lat. 50° 22'. E. long. 2° 7'. The town contains 3792, and the canton 12,619 inhabitants, on a territory of 157½ kiliometres, in 24 communes. *Old Heſdin* is three miles S.E. of the former.

HESHBON, in *Ancient Geography*, a town of Paleſtine, the capital of the tribe of Reuben. It was on the boundaries of the tribe of Gad. (See Joſh. xxi. 39.) It had been the royal city of the Amorites; but after its capture by the Iſraelites it became one of the Levitical cities. Heſhbon, or Heſbon, is 35 miles E. of Jeruſalem.

HESHUSIUS, TILEMANNUS, in *Biography*, noted for his violence againſt the Calviniſts, was born at Weſel, in the year 1526. So great was his proficiency in literature and theology, that, when very young, he was appointed profeſſor of divinity at Heidelberg, and alſo preacher in the church of the Holy Ghoſt. It was in the laſt character that he exhibited that eagerneſs of temper for which he has been noticed by biographers, and on account of which he was deprived of ſome lucrative poſts which he held at Heidelberg. He was afterwards invited into Pruſſia, and appointed profeſſor of theology at Konigſberg. Here he continued till the year 1577, when he was appointed biſhop of Samia; but having written a treatiſe againſt Beza, in which he advanced the abſurd poſition, that "the fleſh of Jeſus Chriſt, in abſtracto, is adorable," he was accuſed, before a ſynod, of maintaining a moſt dangerous propoſition, and was ordered to retract it, which he refuſed, and was accordingly baniſhed. He died at Helmſtadt in 1588. His principal works are, 1. Commentaries on the Pſalms; 2. On Iſaiah; 3. On Paul's Epiſtles; 4. On Juſtification and the Lord's Supper. Bayle.

HESIOD, in *Biography*, an ancient Greek poet, ſuppoſed by ſome to have been a contemporary with Homer, though others have dated the era in which he flouriſhed a century later. He was probably born at Cuma, in Æolia, but removed in his infancy with his father to Aſcra, a ſmall town in Bœotia. Thoſe who contend that he was a contemporary of Homer affirm, that he even obtained a poetical prize in competition with him. He is, at any rate, the firſt that is known to have written a poem on agriculture. This is entitled "The Works and Days," being a kind of calendar of rural occupations; but beſides the inſtructions which are given to the cultivator of the ground, the reader is gratified by a variety of moral reflections, worthy of a Socrates or Plato. His "Theogony" is a miſcellaneous relation, executed without much art or judgment; yet it has been highly eſteemed for the faithful account it gives of the gods of antiquity. "The ſhield of Hercules" is but the fragment of a much larger poem, in which it is imagined the author gave an account of the moſt celebrated heroines among the ancients. Heſiod is ſaid to have written ſeveral other works, which are loſt. He is admired for the elegance of his diction, and the ſweetneſs of his poetry. Pauſanias ſays that in his age the verſes of Heſiod were written on tablets, in the temple of the muſes of which the poet was a prieſt. Virgil, in his celebrated Georgics, has imitated the manner of Heſiod, though he has gone far beyond the model in every kind of excellence. The Greeks were ſo partial to the

poetry and moral inſtructions of Heſiod, that they ordered their children to commit them to memory. Heſiod was murdered by the ſons of Ganyctor of Naupactum, and his body thrown into the ſea. The beſt editions of Heſiod are thoſe of Amſterdam, 1667 and 1701; of Oxford, 1737, and of Leipſic 1746, 1778. Moreri. Lempriere.

HESIVON, in *Geography*, a town of Egypt; 22 miles S.S.W. of Cairo.

HESN, a town of Aſiatic Turkey, in the province of Diarbekir; 40 miles W. of Tecrit.

Hesn-*Dharie*, a town of Arabia, in the province of Nedsjed; 140 miles E N.E. of Mecca.

Hesn-*Keifa*, a town of Aſiatic Turkey, in the province of Diarbekir; 30 miles E.S.E. of Diarbekir.

Hesn-*Mohdi*, a town of Perſia, in the province of Chuſiſtan, at the mouth of the Euphrates; 55 miles E. of Baſſora.

Hesn-*Ratrik*, a town of Aſiatic Turkey, in the government of Maraſch; 25 miles N. of Malatia.

Hesn-*Tchelebi*, a town of Aſiatic Turkey, in the government of Sivas; 40 miles S. of Sivas.

HESNAL-MAI, a ſmall iſland and village of Egypt, in the lake of Tennis; 25 miles N.W. of Tineh.

HESPER, Hesperus, in *Aſtronomy*, the *evening ſtar*; an appellation given to Venus when ſhe follows, or ſets after the ſun.

The word is formed of the Greek Ἕσπερος, and is ſuppoſed to have been originally the proper name of a man, brother of Atlas, and father or grandfather of the Heſperides.

Diodorus, lib. iii. relates, that Heſperus, diſtinguiſhed by his piety, juſtice, and generoſity, having aſcended to the top of mount Atlas, the better to obſerve and contemplate the ſtars, was carried away by an impetuous wind, and never returned more; and that hence he was fabled to have been changed into this ſtar.

HESPERANTHA, in *Botany*, ſo named by Mr. Ker, late Gawler, from ἑσπερα, *the evening*, and ἀνθος, *a flower*, becauſe the flowers expand at the cloſe of day, and ſhut up again in the morning, contrary to the uſual habits of the family to which they belong; and this they perform each for ſeveral ſucceſſive nights. Ker in Ann. of Bot. v. 1. 224. Curt. Mag. v. 21. 790. Ait. Hort. Kew. ed. 2. v. 1 84.—Claſs and order, *Triandria Monogynia*. Nat. Ord. *Enſatæ*, Linn. *Irides*, Juſſ.

Gen. Ch. *Cal.* Spatha inferior, ſhorter than the corolla, of two oblong, ribbed, herbaceous, permanent valves; the outermoſt larger, enfolding the inner one. *Cor.* of one petal, ſuperior; tube cylindrical, ſlightly ſwelling upwards, longer than the calyx; limb regular, in ſix deep, elliptic-oblong, equal, widely ſpreading or reflexed ſegments, the three outer ones moſt coloured at the back. *Stam.* Filaments three, inſerted into the mouth of the tube, ſhorter than the limb, cylindrical, equal; anthers as long as the filaments, vertical, verſatile, linear. *Piſt.* Germen inferior, obſcurely triangular; ſtyle cylindrical, erect, ſtigmas three, ſpreading, as long as the ſtamens, ſeparate to the mouth of the tube, linear. *Peric.* Capſule oblong, bluntly triangular, membranous, toruloſe, of three cells and three valves. *Seeds* numerous, rather ſmall, roundiſh, but ſomewhat angular and rugged, their coat ſlightly pulpy.

Eſſ. Ch. Spatha of two valves. Corolla tubular; its limb regular, in ſix deep, equal, ſpreading ſegments. Stigmas three, linear, ſeparate to the mouth of the tube. Capſule oblong, triangular.

The ſpecies of this genus, of which Mr. Ker, in the Annals of Botany, enumerates ſix, were previouſly referred to *Ixia*, and we ſcarcely think that they ought to be removed from thence. The chief difference, in the technical character, is the oblong capſule, that of *Ixia* being globoſe. The *Heſperanthæ* indeed are night-flowering plants, and the back of their corolla is remarkably different in colour from the front, which is ſcarcely ſeen in *Ixia*; but there is no peculiar difference of habit on the whole. Still, as they are kept ſeparate in the new edition of the *Hortus Kewenſis*, and as the natural order to which they belong is vaſt and intricate, we ſhall, for the ſatisfaction of our readers, indicate the ſpecies.

1. H. *virginea*. (Ixia virginea of the Bankſian herbarium.) Of this Mr. Ker gives us no character nor deſcription, nor is any figure quoted.

2. H. *radiata*. Curt. Mag. t. 573 and 790. (Ixia radiata; Jacq. Ic. Rar. t. 280. I. fiſtuloſa; Andr. Repoſ. t. 59.)—Leaves fiſtulous. Limb of the corolla ſtrongly reflexed.—Native of the Cape of Good Hope, like all the reſt. The dowager lady de Clifford is ſaid to have imported it in 1794. It blooms from April to June. The *leaves* are ſheathing at the baſe, compreſſed upwards, ſhort, various in breadth. *Stem* a foot or more in height, ſimple. *Flowers* racemoſe, drooping, about five or ſix, cream-coloured, yellowiſh, or pale bluſh-coloured, within; ſtriped with purple or brown without. The plates above cited indicate ſeveral varieties of colour. The ſcent of the flowers, when open at night, is ſpicy, like that of a pink.

3. H. *falcata*. (Ixia falcata; Linn. Suppl. 92. Curt. Mag. t. 566. Jacq. Ic. Rar. t. 276. I. cinnamomea; Andr. Repoſ. t. 44.)—Radical leaves ſickle-ſhaped, flat. Segments of the corolla concave. The elegant *flowers* are pure white, except the backs of the three outer ſegments, which are of an uniform red-brown edged with yellow. Jacquin repreſents them crimſon at the back. Their ſmell is like cinnamon, and they are ſaid to open exactly at four o'clock in the afternoon, at the Cape, unleſs rain is at hand, in which caſe they remain cloſed. Mr. Maſſon ſent this ſpecies to Kew in 1787.

4. H. *cinnamomea*. Curt. Mag. t. 1054. (Ixia cinnamomea; Linn. Suppl. 92. Thunb. Diſſ. de Ixia. 10. t. 2. f. 3.)—Radical leaves ſickle-ſhaped, waved and criſped.—Smaller than the laſt, with curiouſly undulated *leaves*. The outſide of the *flowers* is brown; their ſcent is compared, by Mr. Ker, to oil of cloves.

5. H. *anguſta*. (Ixia anguſta; Willd. Sp. Pl. v. 1. 202. Jacq. Ic. Rar. t. 279, by miſtake marked *linearis*. I. radiata, β. anguſta; Curt. Mag. v. 16. 573.)—Leaves linear, ſmooth, flat. Stem zig-zag. Flowers erect.—We know this only by the above authorities. The *herbage* is drawn rather glaucous. *Flowers* greeniſh white.

6. H. *piloſa*. (Ixia piloſa; Thunb. Diſſ. de Ixia. 8.)—Leaves linear, hairy. Flowers rather drooping.—Gathered by Thunberg on hillocks about the Cape town. The *ſtem* is three or four inches high. *Leaves* hairy, not half ſo tall.—*Flowers* white within, reddiſh without, opening at four in the afternoon.

HESPERIA, in *Entomology*, a Fabrician genus of the Papiliones, in which the feelers are compreſſed and hairy at the baſe; the tip cylindrical and naked; and the club oblong and often naked. This newly inſtituted genus correſponds with the Linnæan diviſion of Papilio, *Plebeii*, and like that family is divided into two ſections, *rurales* and *urbicolæ*. They are the ſmalleſt of the butterfly tribe. See Papilio.

HESPERIDES, Ἑσπερίδες, in the *Ancient Mythology*, were the daughters, as ſome ſay, or rather the grand-daughters of Heſper, or Heſperus, the brother of Atlas. According

cording to Diodorus, Hesperus and Atlas were two brothers, who possessed great riches in the western parts of Africa, in a country called Hesperitis. Hesperus had a daughter called Hesperia, or Hesperis, who married her uncle Atlas, and from this marriage proceeded seven daughters, called Hesperides, from the name of their mother, and Atlantides, from that of their father. These young women are said to have possessed such extraordinary beauty and wisdom, that Busiris, king of Spain, having heard of their fame, employed pirates to carry them off. These pirates, finding the daughters of Atlas diverting themselves in a garden, seized upon them; but they were rescued by Hercules, and restored to their father Atlas. That prince, in gratitude to Hercules, made him a present of the apples which he had come in quest of. According to the poets, the Hesperides were three in number, Ægle, Arethusa, and Hesperthusa. Hesiod, in his Theogony, makes them the daughters of *Nox*, *Night*, and seats them in the same place with the Gorgons, *viz.* at the extremities of the west, near mount Atlas; it is on that account he makes them the daughters of Night, because the sun sets there. The Hesperides are represented by the ancients as having the keeping of certain golden apples on the other side of the ocean. And the poets give them a dragon to watch the garden where the fruit grows; this dragon they tell us Hercules slew, and carried off the apples.

Pliny and Solinus will have the dragon to be no other than an arm of the sea, wherewith the garden was encompassed, and which defended the entrance thereof. And Varro supposes, that the golden apples were nothing but sheep, and they are supposed to have been of a particular colour, inclining to gold. It is suggested also, that by the dragon we are to understand the shepherd that kept those sheep, a man of great strength and courage, who used to put to death such as attempted to force from him any of his flock. Others, with more probability, say they were oranges.

The Gardens of the HESPERIDES, *Hesperidium horti*, or *horti Hesperidum*, are placed by some authors at Larach, a city of Fez; by others at Bernich, a city of Barca, which tallies better with the fable. Others take the province of Susa, in Morocco, for the island wherein the garden was seated. And lastly, Rudbecks places the Fortunate islands, and the gardens of the Hesperides, in Sweden.

The isles of the Hesperides were islands of the ocean of uncertain situations; they were either the islands of Cape Verd, the Canaries, or the Azores.

HESPERIS, in *Botany*, is the ἑσπερὶς, or *evening-flower*, of Pliny, because it is most in perfection, and has a very delightful fragrance in the evening. Linn. Gen. 340. Schreb. 443. Tourn. 108. Willd. Sp. Pl. v. 3. 530. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 711. Ait. Hort. Kew. v. 2. 398. Juss. 238. Lamarck Dict. v. 3. 320. Illustr. t. 564.—Class and order, *Tetradynamia Siliquosa*. Nat. Ord. *Siliquosæ*, Linn. *Cruciferæ*, Juss.

Gen. Ch. *Cal.* Perianth of four leaflets, which are linear-lanceolate, cohering longitudinally, incumbent at the top, opening at the bottom, deciduous; the two opposite ones gibbous at their bases. *Cor.* of four, cruciform, oblong petals, their limb rather obliquely reflexed contrary to the sun's motion, with attenuated claws the length of the calyx. *Stam.* Filaments six, awl-shaped, as long as the claws, two of them only half as long as the rest; anthers linear, erect, reflexed at the top; a honey-bearing, acuminated gland is placed between the shorter stamens and the germen, sometimes surrounding each short stamen. *Pist.* Germen the length of the calyx, prismatic, square; style none; stigma cloven, situated internally, oblong, erect, doubly-forked at the base, meeting at the top, withering. *Peric.* Pod long, flatly compressed, striated, of two cells, and two valves as long as the partition. *Seeds* numerous, ovate, compressed.

Ess. Ch. Petals bent obliquely. A gland within-side of the shorter stamens. Pod straight. Calyx closed, having two of its leaves gibbous at the base.

The few species of which this genus is composed, are several of them involved in considerable obscurity. We shall mention the principal ones.

H. triſtis. Night-smelling Rocket. Linn. Sp. Pl. 927. Jacq. Austr. t. 102. Curt. Bot. Mag. t. 730.—"Stem hispid, branched, and spreading."—Native of the outskirts of woods, and shrubby ditches, in Germany, flowering in May. *Root* biennial. The *stem* is about two feet high, erect, rough with long deflexed hairs. *Leaves* scattered, on short stalks, ovate, slightly wavy or toothed, hairy, especially their ribs; the upper part of the stem is branched, bearing numerous spreading clusters of flowers, of that peculiar dull greenish hue, which seems exclusively appropriated to flowers that are fragrant in an evening, and whose scent is best described by its resemblance to the Bergamot pear. On this account the plant is very desirable for cultivation, and more especially because it thrives well in town air, when raised in a pot. We have frequently observed it in the gardens about London. An excellent figure of this plant may be seen in Gerarde's Herbal, 462, under the name of *viola matronalis flore obsoleto*, Russet Dame's Violet, which common name this genus appears to have obtained from the ladies of Germany keeping pots of it in their apartments.

H. laciniata. Willd. n. 2. Allion. Ped. n. 985. t. 82. f. 1, of which we have a specimen from the author himself, appears to be but a slight variety of the last, differing in the stronger teeth of its leaves, possibly this may be the *Leucojum melancholicum*, figured in Ger. em. 463.

H. matronalis. Purple Dame's Violet. Linn. Sp. Pl. 927. (Viola matronalis flore purpureo sive albo; Ger. em. 462.)—"Stem simple, upright. Leaves ovato-lanceolate, finely toothed."—Native of the continent of Europe, flowering in May and June, very common in rustic gardens, and succeeding extremely well even in the town of London. Whether the *root* be annual or biennial we are not certain. The whole plant is clothed with short hairs, and about three feet high. *Flowers* very abundant, pale, purple, or white, exhaling in the evening only a very sweet perfume, like that of a pink or stock. It propagates itself plentifully by seed.

H. inodora. Scentless Dame's Violet. Linn. Sp. Pl. 927. Sm. Fl. Brit. 711. Engl. Bot. t. 731. Jacq. Austr. t. 347.—"Stem erect. Leaves ovato-lanceolate, toothed, sometimes slightly hastate at the base. Petals obtuse."—This is found in Gloucestershire, and in the North of England, as well as in Scotland. We received it from Switzerland as Haller's n. 448. We have also from Mr. Schleicher a specimen of the last described so numbered. The third *Hesperis* of *Clus. Hist.* 297, is the very same cut which we have quoted from Gerarde for *matronalis*. In fact, we really do not know how to distinguish these two species. The synonyms of Linnæus and Jacquin depend on an original specimen in the Linnæan herbarium. Gouan has sent, as *H. inodora*, a very distinct species with much smaller flowers, and shorter, broader, deeply-toothed leaves.

Several more species may be found in Willdenow, about which we have no particular information.

H. vernа. Linn. Sp. Pl. 928. (Leucojum marinum latifolium; Ger. em. 460.) is a very pretty dwarf species, flowering abundantly about the neighbourhood of Naples in

March, and ſeeming to occupy the place of our *Arabis thaliana*, which, however, it much exceeds in beauty. The *leaves* are hoary with ſtellated hairs, and ſtrongly toothed. *Flowers* occaſionally purple or white.

Hesperis, in *Gardening*, contains plants of the hardy, herbaceous, flowery kind; of which the ſpecies moſtly cultivated are, the night-ſmelling rocket, or dame's violet (H. triſtis); the garden rocket, or queen's gilliflower (H. matronalis); and the unfavoury rocket (H. inodora).

The ſecond ſpecies has different varieties, as with ſingle purple flowers, with double flowers of each colour, and with a mixture of each colour. And the Siberian variety has a ſtem of twice the height of the common ſort, the corolla of the flower being purple and not white.

Method of Culture.—Theſe plants are capable of being increaſed either by the ſeeds, the off-ſets from their roots, or by cuttings made from the flower ſtems.

In the ſeed method, the well-ripened ſeeds ſhould be ſown in the early part of the ſpring on a bed or border of light earth, being raked in lightly, or covered in with light mould to the depth of a quarter of an inch. When the young plants have acquired a few inches growth, they ſhould be planted out in beds, ſix inches apart, in order to continue until autumn or the ſpring following, when they ſhould be tranſplanted to the places where they are to grow and flower.

From moſt of theſe ſeedling plants only producing ſingle flowers, and a great many of theſe going off as ſoon as they have flowered, it is neceſſary to provide annually a freſh ſupply.

The moſt certain method of increaſing the double ſorts is by having recourſe to the diviſion of their roots, or by planting out cuttings made from them.

In the root method of proceeding, with the intention of providing off-ſets more abundantly, ſome of the beſt plants ſhould be placed in an open bed or border, and not ſuffered to run up fully to flowers; but as ſoon as the flower ſtems have advanced eight or ten inches in height to cut them down as cloſe to the ground as poſſible; and as they ſhoot again to have them alſo cut off; for by ſtopping their upright growth in this manner, the roots are induced more readily to throw out young off-ſets from their ſides, which will be well formed by the beginning of the autumn, when the whole root ſhould be taken up, and the off-ſets ſeparated from it, and planted out in a nurſery bed at about ſix inches diſtance, in order to continue until the beginning of autumn, or the following ſpring; at which times they ſhould be carefully removed to the places where they are to grow for flowering, with good balls of earth about their roots.

Such of the flower ſtems as are thus cut down occaſionally for the purpoſe of increaſing the number of off-ſets, may be formed into cuttings of proper lengths, and planted out in the method that is adviſed below, when each of them will conſtitute a plant for flowering in the ſucceeding year. This practice ſhould be had recourſe to every year in order to keep up the ſtock of double flowers; as thoſe plants which run up to full growth and flower, ſeldom ſend out any off-ſets, except a very few in caſes where the ſtalks are removed immediately after the flowers begin to decline, but which are rarely of much ſtrength.

The proper ſeaſon for planting out the cuttings of the flower ſtems is any time in the early part of the ſummer, as ſoon as the ſtalks are advanced about a foot in length, or before the plants flower, each being divided into two or three cuttings of about four or five inches in length. The lower half commonly furniſhes the beſt cuttings.

Theſe cuttings ſhould be planted out in a ſhady border, depoſiting them two parts within the ground and about three inches aſunder, water being given at the time, and repeated as there may be occaſion.

In moſt caſes, a number of the cuttings will have ſtricken good root, and formed ſhoots at the tops in the courſe of ſix or eight weeks. But in order to promote their taking root in a more effectual manner, they ought to be covered cloſely with bell or hand-glaſſes as ſoon as they are planted, raiſing them occaſionally as the plants begin to ſhoot at the tops, in order to the admiſſion of air, to the influence of which they ſhould be gradually hardened.

Theſe different ſpecies of plants afford a fine ornamental effect in the large open borders and clumps of pleaſure-grounds; as well as when mixed and interſperſed with other plants of the herbaceous kinds, towards the front parts of the more ſhowy clumps, and on the ſides of the lawns and walks, in which they ſhould be always planted in the autumn or very early ſpring, before they begin to puſh for flower ſtems.

Hesperis, in *Ancient Geography*, a town of Cyrenaica, reckoned by Pomponius Mela among the five towns of the Pentapolis, the other four being Apollonia, Ptolemais, Arſinoé, and Cyrené. The name Heſperis, according to Pliny, Ptolemy, and Ammianus Marcellinus, ſucceeded to *Berenice*, which ſee.

HESS, El, in *Geography*, a town of Nubia, ſix miles S. of Sennaar.

HESSA, an iſland in the Nile, 11 miles S. of Syené.

HESSE, William, *prince of*, in *Biography*, who flouriſhed in the 16th century, was a great encourager of learning, particularly of aſtronomical ſcience. He built an obſervatory at Caſſel, and was for many years a moſt aſſiduous obſerver of the heavenly bodies. He died in 1597, and his obſervations were printed at Leyden in 1618.

Hesse, in *Geography*, a principality of Germany of variable boundaries; but of late bounded by the biſhopric of Fulda, the principalities of Hersfeld, Thuringia, Eichsfeld, Calenberg, and Waldeck, biſhopric of Paderborn, duchy of Weſtphalia, and counties of Witgenſtein, Solms, Naſſau, Dillenburg, and Upper Iſenburg; without including within theſe limits, Catzenenelnbogen and ſome other territories. The ruling ſtate is Heſſe-Caſſel, ſo called from the capital. This territory is about 80 Britiſh miles in length, and nearly the ſame in breadth, 2760 miles ſquare, including 750,000 inhabitants, or with Heſſe-Darmſtadt, according to Hoeck, only 700,184, and poſſeſſing a military force of 12,000 men. The annual revenue of Heſſe-Caſſel has been uſually eſtimated at about 1,200,000 rix-dollars; and that of Darmſtadt at 600,000. Heſſe is divided into Upper and Lower, and ſub-divided into five diſtricts, which take their names from the rivers Lahn, Schwalm, Fulda, Werra, and Diemel. The principal town of Lower Heſſe is Caſſel, and Marburg is the capital of Upper Heſſe.

The country is generally mountainous, interſperſed with many pleaſant vales, ſometimes concealing vineyards, and fields fertile in corn and paſturage, which feed multitudes of cattle. It abounds in game and fiſh, and has many foſſils and minerals; the ſands of the Eder contain particles of gold; and there was formerly a mine of that metal, of ſmall account, near Frankenberg. There are alſo found ſilver, copper, lead, alum, vitriol, coal, fine clays, with veins of marble and alabaſter, and ſome medicinal waters. Detached parts are watered by the Rhine and Mayn, which are the two principal rivers. In this country, the ſtates are of three orders, *viz.* nobles, clergy, and burgeſſes from Caſſel, Marburg, and other towns. The religion is the reformed, with two or three ſuperintendants. The univerſities are thoſe of Marburg

Marburg and Rinteln, and that of Gieſſen belonging to Heſſe Darmſtadt, which is under the dominion of another branch of the family. The natural products of the country ſupply ſome trade, and a few manufactures of linen, cloth, hats, ſtockings, &c. The chief city is Caſſel, containing about 22,000 inhabitants, which has often ſuffered by war; the Heſſians being more remarkable for expoſing their lives abroad, than for a vigorous defence of their own country. Hanau is alſo a conſiderable place, and gives name to a county, which is ſuppoſed to contain 100,000 perſons. The artificial rivers and cataracts of the elector's country palace, Wilhemſhohe, are the firſt in Europe. Two leagues from Darmſtadt is the Felſberg, called the ſea of ſtones, on account of the number of granite pillars, prepared by the Romans for ſome work; it is a fine-grained light grey granite.

Some perſons, by an arbitrary etymology, have derived the appellation of Heſſi from that of the ancient Catti; whereas it moſt probably originates from the river Eſſe, which runs into the Fulda. However this be, the territory was anciently occupied by the Catti. In the year 902 there were counts of Heſſe, one of whom became king of Germany. In 1292, Heſſe became a principality of the empire, though in proceſs of time it was commonly denominated a landgravate. All the territories were united under Philip the Generous, from whom all the modern landgraves are deſcended. He, in his will, divided his dominion among his four ſons; and from the eldeſt, who had half, aſcended the houſe of Heſſe-Caſſel; the youngeſt, who received the half-quarter part, was the founder of the houſe of Heſſe-Darmſtadt. Accordingly in Heſſe, there have been two ſovereign families, *viz.* Caſſel and Darmſtadt, between whom all the Heſſian territories were divided, with ſeveral articles of ſovereignty poſſeſſed in common. In both houſes there have been princes appenaged; thoſe of Heſſe-Caſſel were Heſſe-Philip-Ithal, and Rothenburg or Rhinfels. The only appendage of Heſſe-Darmſtadt was Heſſe-Homburg. Since the peace of Tilſit, Heſſe-Caſſel has been annexed to the kingdom of Weſtphalia.

Hesse-Darmstadt. See the preceeding article and Darmstadt.

HESSERAH, a town of Hindooſtan, in Dowlatabad; 10 miles E. of Carmullah.

HESSIAN Bellows. See Bellows.

HESTER, in *Geography*, a town of Sweden in Eaſt Gothland; 25 miles S.W. of Linkioping.

HESTRA, a town of Sweden, in the province of Smaland; 55 miles W. of Wexio.

HESTROE, one of the ſmaller Faroer iſlands; ſix miles N. of Sandoe.

HESUDRUS, in *Ancient Geography*, a river of India; probably the ſame with the preſent Setlege or Sutterlaz.

HESYCHASTES, Hesychasta, a perſon who keeps himſelf vacant, and at leiſure, to attend the better, and with the leſs interruption, to the contemplation of divine things.

The word is Greek ἡσυχαστὴς, formed of ἡσυχάζω, *quieſco, quieti indulgeo*, a derivative of ἡσυχος, *quietus, quiet*; ſo that heſychaſtes, in Greek, anſwers to the literal ſenſe of *quietiſt* in Engliſh.

The name was chiefly uſed by the ancients for ſuch among the monks as did not employ themſelves in any labour of the hands, but renounced all bodily action, to reſign themſelves wholly to prayer and meditation.

HESYCHASTIC, in the *Ancient Muſic*, a kind of melopopeia of the Greeks, proper to calm the paſſions. Encycl. Suppl.

HESYCHIUS of Alexandria, in *Biography*, is placed by different writers in the fourth and at the end of the ſixth century. He is celebrated as a great lexicographer, and has been ſuppoſed by ſome to be the ſame perſon as the patriarch of Jeruſalem, of that name. From the inſertion of ſcriptural words in his lexicon, it is inferred that he was a Chriſtian, though critics have thought that theſe might have been added by another hand. His work is a Greek lexicon or vocabulary, which has been eſteemed by authors of reputation one of the moſt valuable treaſures of the Greek language. Daniel Heinſius wrote notes upon it. The beſt editions are thoſe of Schrevelius 1668, and of Alberti Leyden in two volumes folio, 1746. Moreri.

Hesychius of Miletus, ſon of a ſpecial pleader of that name, who flouriſhed under the emperors Juſtin and Juſtinian, compoſed an "Univerſal Hiſtory" from the reign of Belus to the death of Anaſtaſius. He was author likewiſe of two books "De Viris Doctrina Claris." and "De Rebus Patrius Conſtantinopoleos." The two latter works were edited in Greek and Latin by Meurſius, who added his own notes, with thoſe of Adrian Junius, and Henry Stephens. It was printed at Leyden in 12mo. in the year 1613. Moreri.

HETERANTHERA, in *Botany*, ſo named by Paliſot de Beauvois, from ἑτερος, *other*, or *different*, and ἀνθηρα, *an anther*, becauſe one of thoſe parts is often different in ſhape or proportion from the reſt, in the ſame flower.—Vahl. Enum. v. 2. 42. (Leptanthus; Michaux Boreal-Amer. v 1. 24.)—Claſs and order, *Triandria Monogynia*. Nat. Ord. *Junci*, Juſſ.

Gen. Ch. *Cal* Spatha inferior, of one leaf, convoluted, containing one or more flowers. *Cor.* of one petal, inferior; tube thread-ſhaped, very long; limb regular, in ſix deep, nearly equal, oblong ſegments. *Stam.* Filaments three, inſerted into the baſe of the limb, linear, ſhorter than the limb, one of them often longer than the reſt; anthers vertical, roundiſh or oblong. *Piſt.* Germen ſuperior, cloſely inveſted with the baſe of the tube, oblong; ſtyle thread-ſhaped, the length of the tube; ſtigma a little dilated, downy, ſomewhat concave. *Peric.* Capſule inveſted with the tube and the calyx, oblong, obſcurely triangular, of three cells and three valves, burſting at the angles, the partitions very narrow, from the centre of each valve. *Seeds* numerous, in a double ſeries in each cell, ovate, longitudinally ſtriated.

Eſſ. Ch. Spatha of one valve. Corolla of one petal; its limb in ſix deep ſegments, nearly equal. Stigma ſimple. Capſule ſuperior, of three cells and three valves. Seeds many.

1. H. *acuta*. Willd. in Nov. Act. Soc. Amer. Hiſt. Nat. v. 3. 438. (Leptanthus reniformis, Michaux v. 1. 25.)—Leaves roundiſh-kidney-ſhaped, acute. Spatha ſmooth, containing about three flowers.—Gathered by M. Louis Boſc in Pennſylvania and Virginia. *Stem* creeping, taking root at the joints, leafy. *Leaves* ſtalked, the earlier ones floating, an inch or more in length and breadth, ſomewhat heart-ſhaped at the baſe, ſmooth like the reſt of the plant. *Flowers* from near the baſe of the foot-ſtalks. *Spatha* an inch long. *Corolla* in two principal diviſions, each in three ſhorter ones, of which the middle one is broadeſt in the upper half, narroweſt in the lower. Two *ſtamens* bear round *anthers*; the third, which is longeſt, an oblong one.

2. H. *reniformis*. Ruiz and Pavon Fl. Peruv. v. 1. 43. t. 71. f. *a*.—Leaves roundiſh-kidney-ſhaped. Spatha oblong, pointed, many-flowered.—Native of marſhes and pools at Linn.—*Stem* branched, ſtriated. *Stipules* ſcarioous, convoluted, ſtriated, enfolding the young leaves and flowers. *Leaves* ſtriated beneath, on very long ſtalks. *Spatha* at length reflexed, terminating in a linear point.

Flowers three or four, of a pale green, their longer filament bearing a long arrow-ſhaped anther.

3. H. *pubeſcens*. Vahl. n. 3. (Pontederia; Linn. in Loefl. It. 178.)—Leaves heart-ſhaped, acute; the radical ones downy. Spatha linear, many-flowered.—Gathered by Lœfling in marſhes near Barcelona in South America. *Stem* a ſpan high. Upper *leaves* ſmooth. *Flowers* from a ſlit in the uppermoſt footſtalk, pale purpliſh blue.

4. H. *cordata*. Vahl. n. 4.—Leaves cordate-oval, very blunt. Spatha oblong, very obtuſe, about three-flowered.—Found in South America by Von Rohr.—*Stem* a ſpan high. *Leaves* riſing above it, ſcarcely more than half an inch in length, on long ſtalks. *Spatha* ſhort and narrow.

5. H. *limoſa*. (Pontederia limoſa; Swartz. Ind. Occ. v. 1. 611. Leptanthus ovalis; Michaux v. 1. 25. t. 5. f. 1.)—Leaves ovate-oblong. Spatha lanceolate, ſingle-flowered.—Native of the muddy banks of rivers in Jamaica, Hiſpaniola, and the country of the Illinois in Canada, flowering in Auguſt. *Stems* ſeveral, very ſhort, each bearing only one or two ovate, ſmooth, erect *leaves*, on long, thick, fiſtulous ſtalks, from whoſe lower part ſprings a ſhort *flower-ſtalk*, with a ſingle-flowered, oblong, pointed *ſpatha*. *Corolla* blue. *Stigmas* ſix, according to Swartz, which is remarkable, and requires examination.

6. H. *diverſifolia*. Vahl. n. 6.—Leaves partly ovate, inclining to heart-ſhaped, ſtalked; partly linear and ſeſſile.—Gathered by M. Richard in Guiana. *Stem* ſlender, branched. Lower *leaves* linear, acute, wavy, probably immerſed; the upper apparently floating, thicker than the former. *Foot-ſtalks* roundiſh. *Spatha* ſaid by Richard to conſiſt of two valves.

7. H. *graminea*. Vahl. n. 7. (Leptanthus gramineus; Michaux v. 1. 25. t. 5. f. 2.)—All the leaves linear.—Gathered by Richard in the river Ohio. This has the aſpect of *Potamogeton gramineum*. *Stem* ſlender, throwing out roots from the joints. *Leaves* alternate, ſheathing, ſeſſile, two inches long. *Spathas* ſolitary, axillary, ſingle-flowered. Tube of the *corolla* much longer than the leaves. *Stamens* ſometimes four.

None of the ſpecies of this genus have been brought alive to England, nor are they, ſcarcely, to be met with in herbariums. They all ſeem to be aquatics. Their flowers are inconſpicuous, and probably very tranſitory. The name given by Michaux to this genus, from λεπτος, *ſlender*, and ανθος, *a flower*, is very expreſſive of their appearance.

HETERIARCH, Heteriarcha, in *Antiquity*, an officer in the Greek empire, whereof there were two ſpecies; the one called ſimply heteriarch; and the other, great heteriarch, who had the direction of the former.

The word is Greek εταιριαρχα, formed of the Greek εταιρος, *ſocius, companion, ally*, and αρχη, *imperium, command*. Their principal function was to command the troops of the allies; beſides which, they had ſome other duties in the emperor's court, deſcribed by Codin, De Officiis, cap. 5. n. 30, 31, 32, 37.

HETEROCERUS, in *Entomology*, a genus of Coleoptera, eſtabliſhed by Boſc in the Tranſactions of the Natural Hiſtory Society of Paris. The antennæ in this genus are very ſhort, and compoſed of ten joints, the two firſt of which are very large, the ſucceeding ſeven ſmaller, and forming by their union at the outer edge a kind of ſerration, the extreme joint obtuſe; the head is advanced and elongated, and the jaws, which are exſerted, are denticulated at the tip; the thorax is convex and attenuated in front; the body ovate.

This genus is nearly allied in appearance to the Dermeſtes, to which genus Thunberg refers the ſpecies deſcribed by Boſc under the name of marginatus. Fabricius, in his manTiſſa, places it in the genus Apate. Marſham adopts the generic name aſſigned by Boſc. The habits of the heterocerus are not peculiar; it frequents ſtagnant waters, where it is ſuppoſed to feed on the refuſe of decayed animal and vegetable ſubſtances, and on the multiplicity of animalculæ that occur in ſuch ſituations. There are four joints in the tarſi of the legs.

Species.

Marginatus. Downy, blackiſh; margin and dots on the wing-caſes ferruginous. *Heterocerus marginatus*, Boſc. *Dermeſtes ſineſtratus*, Thunb. *Heterocerus marginatus*, Marſh. Ent. Brit.

This ſpecies, according to Olivier, is not rare in the marſhes of the foreſt of Bondy, in France. It has been alſo taken in abundance, near Sheerneſs, in the month of September. Its length is about two lines and a half.

HETEROCLITE, Heterocliton, in *Grammar*, an irregular, or anomalous word, which either in declenſion, conjugation, or regimen, deviates from the ordinary rules of grammar. See Anomalous.

The word is Greek ἑτεροκλιτον, formed of ἑτερος, *alter, another, different*, and κλινω, *I decline*.

Heteroclite is more peculiarly applied to nouns, which vary, or are irregular, in point of declenſion; having fewer caſes, numbers, &c. than ordinary; or that are of one declenſion in one number, and another in another.

We have various ſorts of heteroclites, as defective and redundant heteroclites, &c. Under the claſs of heteroclites come aptotes, diptotes, monoptotes, triptotes, tetraptotes, pentaptotes, &c.

HETERODOX, formed of the Greek ἑτεροδοξος, a compound of ἑτερος, *alter*, and δοξα, *opinion*, in *Polemical Theology*, ſomething that is contrary to the faith or doctrine eſtabliſhed in the true church. Thus, we ſay, a heterodox opinion, a heterodox divine, &c.

The word ſtands in oppoſition to *orthodox*.

Heterodox, *Heterodoxi*, in *Botany*, that ſet of ſyſtematical writers on this ſcience, who formed their diſtributions and claſſes of the plants on wrong foundations, not on the diviſions made by nature in the different ſtructure of the parts of fructification in the different claſſes, but on the ſhape of their leaves, or roots; or who ranged them by their common names, according to the letters of the alphabet. Linnæi. Fund. Bot. p. 2. See Botany.

HETERODROMUS Vectis, in *Mechanics*, a lever wherein the fulcrum, or point of ſuſpenſion, is between the weight and the power. This is what we otherwiſe call a *lever of the firſt kind*. See Lever.

This term is uſed by way of contradiſtinction to the *homodromus vectis*.

HETEROGENEITY, in *Phyſics*, the quality or diſpoſition which denominates a thing heterogeneous.

The word is alſo uſed for the heterogeneous parts themſelves. In which ſenſe, the heterogeneities of a body are the ſame thing with the *impurities* thereof.

Heterogeneity is a term of a very lax ſignification: but, ſo far as the term may be made uſe of, to convey any diſtinct ſignification, it muſt be by conſidering natural bodies under different ſortments, according as they are diverſified by figure, bulk, motion, and their more ſenſible properties; ſo that thoſe of different ſortments are heterogeneous to one another, and the parts of the ſame ſortment are homogeneous.

In effect, they are two terms, which ſerve frequently

as a refuge for ignorance; otherwiſe, the common terms of *like* and *unlike* may ſerve every whit as well. Quincy.

HETEROGENEOUS, or HETEROGENEAL, literally imports ſomething of a different nature, or that conſiſts of parts of different or diſſimilar kinds; in oppoſition to homogeneous.

The word is Greek, formed of ἑτερος, *alter, different*, and γενος, *genus, kind*; q. d. compoſed of different kinds of parts.

HETEROGENEOUS is particularly applied, in *Mechanics*, to thoſe bodies, whoſe denſity is unequal in different parts of their bulk. Or, heterogeneous bodies are ſuch, whoſe gravities in different parts are not proportionable to the bulks thereof.

Bodies equally denſe, or ſolid in every part, or whoſe gravity is proportionable to their bulk, are ſaid to be homogeneous.

HETEROGENEOUS *Light*, is that which conſiſts of parts or rays of different refrangibility, reflexibility, and colour.

HETEROGENEOUS *Nouns*, in *Grammar*. See NOUN, GENDER, &c.

HETEROGENEOUS *Numbers*. See NUMBERS.

HETEROGENEOUS *Quantities*, are thoſe which are of ſuch different kind and conſideration, as that one of them, taken any number of times, never equals or exceeds the other.

HETEROGENEOUS *Surds*, are ſuch as have different radical ſigns; as $\sqrt{}$ a a, and $\sqrt[3]{}$ b b; $\sqrt[5]{}9$, and $\sqrt[7]{}19$.

How to reduce the heterogeneous ſurds to homogeneous ones, ſee under the article SURDS.

HETEROPHAGI, formed of ἑτερος, *different*, and φαγω, *I eat*, in *Natural Hiſtory*, a term uſed by ſome authors to expreſs a peculiar claſs of inſects, diſtinguiſhed by their eating many different things, but not feeding on one another, as thoſe do which are of the claſs of the allelophagi, of which there are a great number of ſpecies.

HETEROPLON, in *Antiquity*. See AMPHOTEROPLON.

HETEROPYRÆ, in *Natural Hiſtory*, the name of a genus of ferruginous foſſils, compoſed of ſeveral coats, incloſing a nucleus of a different ſubſtance from themſelves, and often looſe, and rattling in them. See SIDEROCHITA.

Of this genus there are ſeven ſpecies. Hill's Foſſils, p. 536.

HETERORHYTHMUS, compounded of ἑτερος and ῥυθμος, *meaſure*, a term uſed, by ſome fanciful writers, for a courſe of life unſuitable to the age of thoſe who live in it.

The ſame is alſo applied to pulſes, when they beat variouſly or irregularly in diſeaſes; or rather, when a pulſe belonging to one age is found in a patient of another.

HETEROSCII, formed of ἑτερος, *different*, and σκια, *ſhadow*, in *Geography*, a term vulgarly applied to thoſe inhabitants of the earth whoſe ſhadow at noon-tide is always projected the ſame way, either north-ward, or ſouth-ward.

In this ſenſe, the inhabitants of the temperate zones are denominated heteroſcii. See ZONE.

HETEROSCII, however, in ſtrictneſs, and according to the origin and reaſon of the word, is a term of relation, and denotes thoſe inhabitants, which, during the whole year, have their noontide ſhadows projected different ways from each other. Thus, we who inhabit the northern temperate zone, are heteroſcii with regard to thoſe who inhabit the ſouthern temperate zone; and they are heteroſcii with reſpect to us.

From this definition it follows, that only the inhabitants of the two temperate zones are heteroſcii; nor is the word ordinarily applied to any other; though, in reality, there is always one part of the torrid zone, whoſe inhabitants are heteroſcii with regard to thoſe of the reſt, and with regard to thoſe of one of the temperate zones, except at the time of the ſolſtices. And even at that time, all of the torrid zone are heteroſcii with regard to thoſe of one of the temperate zones. But as this is variable, and the people of the torrid zone have their ſhadow now on this, and then on that ſide, the cuſtom is to call them *amphiſcii*, and not *heteroſcii*.

HETEROSPERMUM, in *Botany*, a name given by the late abbé Cavanilles, from ἑτερος, *different*, and σπερμα, *ſeed*, from the two different forms of the ſeeds in the ſame flower. He writes it *Heteroſperma*; but Willdenow, in adopting the genus, has properly corrected him, as above. Cavan. Ic. v. 3. 34. Willd. Sp. Pl. v. 3. 2129. Claſs and order, *Syngeneſia Polygamia-ſuperflua*. Nat. Ord. *Compoſitæ oppoſitifoliæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Common Calyx* ſimple, in three or four deep, linear ſegments. *Cor.* compound, radiated; florets of the diſk ſeveral, tubular, four-cleft in their border, hermaphrodite; thoſe of the radius three or four, female, prolific, their corolla ligulate, ſhort, three-cleft. *Stam.* Filaments four, very ſhort, in the florets of the diſk only; anthers forming a cylinder. *Piſt.* Germen to each of the florets, except three or four in the very centre, ovate, compreſſed, bordered; ſtyle thread-ſhaped; ſtigmas two, revolute. *Peric.* none, except the permanent calyx. *Seed* ovate, ſurrounded by a membrane concave on the inner ſide, three or four of the inner ſeeds, as they approach the centre, becoming narrower and longer, with a cloven beak at the ſummit, which in the innermoſt is barbed with reverſed briſtles. *Recept.* ſmall, clothed in the circumference with ovate ſcales.

Eſſ. Ch. Receptacle ſcaly in the circumference. Seeds of the circumference ovate, with a membranous margin; of the centre oblong, crowned with a cloven awn. Calyx ſimple, deeply four-cleft.

Obſ. Willdenow takes the large ovate ſcales of the external part of the receptacle for an inner calyx; but it ſeems to us, by analogy, that they are beſt underſtood as above. Cavanilles obſerves, that it is not merely the radius which bears ovate ſeeds; the elongated briſtly ones, like thoſe of *Bidens* in appearance, being only three or four in the middle part, next to the very central florets of all, which have no traces of germen or ſeed.

1. H. *pinnatum*. Cavan. Ic. t. 267. Leccions 204 — Stem ſmooth. Leaves pinnate, linear, entire. Native of New Spain, flowering in the botanic garden at Madrid from Auguſt to October. *Root* annual. *Stem* a yard high, leafy, with oppoſite branches. *Leaves* oppoſite, connate, compoſed of three pair of linear entire leaflets, an inch long, with an odd one. *Flowers* ſmall, yellow, ſolitary, on long, ſimple, terminal, naked ſtalks.

2. H. *ovatum*. Willd. n. 2. (H. ovatifolia; Cavan. Leccion. 204.)—Stem hairy. Leaves ſimple, ovate, toothed in their upper part.—Gathered by Luis Née in Peru. The *ſtem* is branched, villoſe. *Leaves* oppoſite, ovate, from five to eight lines long, ſomewhat fringed in the lower part. In other reſpects this ſpecies much reſembles the former. *Cavanilles*.

HETEROSTROPHE, formed of ἑτερος and στρεφω, *I turn*,

an.

an epithet applied to certain ſhells, the wreaths of which turn a contrary way from thoſe of other ſhells of the ſame genera. We have in the Philoſophical Tranſactions, N° 56, an account of two very remarkable ſnail-ſhells of this kind.

HETEROUSII, Heterousians, compoſed of ἑτερος, and ουσια, *ſubſtance*, a ſect or branch of Arians, the followers of Aëtius, and from him alſo denominated *Aëtians*.

They were called Heterouſii, becauſe they held, not that the Son of God was of a ſubſtance like, or ſimilar to, that of the Father: which was the doctrine of another branch of *Arians*, thence called *Homoouſians*, *homoouſii*; but that he was of another ſubſtance different from that of the Father.

HETH, in *Scripture Hiſtory*, the father of the Hittites, was the eldeſt ſon of Canaan, and dwelt S. of the promiſed land, at or near Hebron. Some maintain that there was a city called Heth; but no traces of it occur in ſcripture.

HETSHOLM, or the Horse *Iſle*, in *Geography*, an uninhabited iſland of the Baltic, S. of Vorms or Ormſon; only viſited for taking its crop of hay.

HETSIN, or Etsin, a town of Corea, in the province of Tchu-ſin; 97 miles E. of King-kitao. N. lat. 36° 47′. E. long. 126° 54′.

HETTSTADT, or Heckstadt, a town of Germany, in the county of Mansfield, belonging to Saxony, on the Wipper. The magiſtrates of this town poſſeſs conſiderable privileges. The caſtle or palace is converted into a brewery: five miles N. of Mansfield. N. lat. 51° 49′. E. long. 11° 42′.

HETZARDARA, or the Thouſand mountains, a mountain of Perſia, S.S.W. of Iſpahan, between the provinces of Irak and Farſiſtan. One branch of this mountain, which gives riſe to the river of Iſpahan, is called Koh Zerdeh, or the Yellow mountain.

HEUCHERA, in *Botany*, a genus named in honour of John Henry Heucher, profeſſor of medicine in the univerſity of Wittemberg, who publiſhed, in the year 1711, "Index Plantarum Horti Medici Academiæ Wittembergenſis." This work was arranged according to the ſyſtem of Rivinus, with many annotations, containing various ludicrous as well as fabulous botanical obſervations. It is not ſurprizing then that a book which appeared at Wittemberg in the year 1720, under the title of *Vegetabilia Magica*, ſhould have been aſcribed to our author, though, it ſeems, he was innocent of the charge. The following treatiſe he publiſhed in 1712, "De igne per ignem extinguendo, ſive de præſtantiſſimo Camphoræ uſu in febribus acutis."—Linn. Gen. 125. Schreb 174. Willd. Sp. Pl. v. 1. 1328. Mart. Mill. Dict. v. 2. Juſſ. 308. Lamarck Dict. v. 3. 127. Illuſtr. t. 184. Gærtn. t. 36.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Succulentæ*, Linn. *Saxifragæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, with five, roundiſh, narrow, obtuſe ſegments. *Cor.* Petals five, lanceolate, inſerted into the margin of the calyx, and of the ſame length with it. *Stam.* Filaments five, awl-ſhaped, erect; anthers roundiſh. *Piſt.* Germen roundiſh, cloven half way down, ending in two ſtraight ſtyles, the length of the ſtamens; ſtigmas obtuſe. *Peric.* Capſule ovate, acuminated, half cloven, of two cells, with two beaks which are reflexed. *Seeds* numerous, ſmall.

Eſſ. Ch. Petals five. Capſule with two beaks and two cells.

1. H. *americana*. Linn. Sp. Pl. 328. Ehr. Exſicc. n. 34. (H. Cortuſa; Michaux Boreal-Amer. v. 1. 171. Cortuſa americana, flore ſqualidè purpureo; Herm. Parad. 131.) "Downy and viſcid. Leaves roundly lobed. Panicle rather denſe."—A native of various parts of North America, ſcarcely cultivated in this country, except in the more curious gardens.—It is perennial, flowering early in the ſummer. *Leaves* radical, heart-ſhaped, on long ſtalks, cut, and crenate. *Flower-ſtalks* taller than the leaves, bearing numerous, inconſpicuous, but not inelegant browniſh flowers.

2. H. *villoſa*. Michaux Boreal-Amer. v. 1. 172.—"Very villoſe. Leaves acutely lobed. Panicle lax."—Found on the higher mountains of North Carolina by Michaux. It is ſmaller and more ſlender than the former, with ſmall white flowers. We know it only from the above quoted author's account.

HEUCHIN, in *Geography*, a town of France, in the department of the ſtraits of Calais, and chief place of a canton, in the diſtrict of St. Pol; eight miles N.N.W. of St. Pol. The town contains 513, and the canton 12,559 inhabitants, on a territory of 185 kiliometres, in 33 communes.

HEVE, or La Haive, a port and cape on the S. coaſt of Nova Scotia.

HEVEA, in *Botany*, a name of Aublet for one of the trees producing elaſtic gum. Schreber retains it as a genus by the appellation of *Siphonia*, but Juſſieu reduces it to *Jatropha*.

HEVELIUS, in *Biography*, a celebrated Poliſh aſtronomer, was born at Dantzic in the year 1611. He ſtudied mathematics with great ardour, but he chiefly devoted himſelf to aſtronomical purſuits, and built an obſervatory for the purpoſe of making accurate obſervations, which he did with inſtruments of his own conſtruction; the reſult of theſe was publiſhed in 1647 under the title of "Selenographia," or a Deſcription of the Moon, to which he added the phaſes of the other planets, as obſerved by the teleſcope. He was author of many valuable diſcoveries in the heavens. He firſt obſerved the libration of the moon, and diſcovered ſeveral fixed ſtars, which he named "The firmament of Sobieſki," in honour of John III. king of Poland. He drew up a large catalogue of the ſtars, and collected many of the unformed ones into new conſtellations of his own formation. In making his obſervations he received much important aſſiſtance from his wife, who, under his inſtructions, had become an adept in the ſcience, and to whom a part of the honour of them is due. Hevelius publiſhed many works beſides that which is above noticed, but his "Cometographia," publiſhed in 1668, is the moſt valuable, though they all poſſeſs much merit. This work ſets forth the nature of comets, their ſituation, parallaxes, diſtances, varying appearances, and ſurpriſing motions, with a hiſtory of all the comets from the creation to the preſent time, illuſtrated with a curious engraving of his own execution. Having ſent a copy of this work to Dr. Hooke, it occaſioned a controverſy between them on this ſubject, "whether diſtances and altitudes could be taken with plain ſights nearer than to a minute," which Hooke denied, and Hevelius maintained. In 1679, Hevelius had the misfortune to have his houſe at Dantzic burnt down. By this calamity he ſuſtained a loſs to the amount of ſeveral thouſand pounds, having not only his obſervatory, and all his valuable inſtruments deſtroyed, but his books, and numerous copies of his "Machina Cœleſtis," which had lately iſſued from the preſs. He died at Dantzic in 1688, on the day in which he had completed his ſeventy-ſixth year, univerſally reſpected. After his deceaſe ſome poſthumous works of this aſtronomer were given to the world, particularly "Prodromus Aſtronomiæ, et novæ Tabulæ Solares, una cum Catalogo Fixarum," in which

which he lays down the neceſſary preliminaries for taking an exact catalogue of the ſtars. Moreri.

HEUGH-HEAD, in *Geography*, a cape of Scotland, in the Frith of Forth, on the coaſt of Fife; three miles W. of Elieneſs.

HEVILKASERAI, a town of Hindooſtan, in Candeiſh; 18 miles S.S.E. of Barawnay.

HEVOSKARI, a cluſter of ſmall iſlands, in the gulf of Bothnia, near the coaſt of Finland. N. lat. 64° 12'. E. long. 23° 32'.

HEURNIUS, or VAN HEURNE, JOHN, in *Biography*, an eminent medical profeſſor, was born at Utrecht, on the 25th of January, 1543, where his father was a vintner. No expence was ſpared in order to procure him a liberal education; but ſo tardily did his faculties develope themſelves, that it is ſaid he was ſcarcely able to read at ten years of age, and was not maſter of the rules of grammar before his fifteenth year. From that time, however, he entered with extreme ardour into ſtudy, paſſing even nights and days in continued occupation, and made a rapid progreſs. He ſtudied at Louvain, and afterwards at Paris, under Duret. Thence he went to the ſchools of Italy, having Fabricius ab Aquependente and other eminent profeſſors for his tutors at Padua; and at Pavia he took the degree of M. D. in 1571. Here he remained two years longer, in the capacity of phyſician to a nobleman. He declined a very favourable offer, made by one of the profeſſors of Pavia, of reſigning his chair in his favour, and giving him his only daughter in marriage, and returned to Utrecht in 1573, after an abſence of twelve years. Here he began the practice of his profeſſion, was appointed phyſician to the counts of Egmont, and nominated a magiſtrate of that city by the prince of Orange. But he was induced to relinquiſh theſe advantages, upon an appointment to the medical profeſſorſhip in the univerſity recently eſtabliſhed at Leyden, whither he went about the end of October, 1581. He fulfilled the duties of this poſt with great reputation for twenty years, during which he was alſo engaged in a very extenſive practice, and was often conſulted by William I. prince of Orange. He had enjoyed uniform good health, until about the 56th year of his age, when he became ſubject to frequent attacks of pain from ſtone in the bladder, which tormented him for two years, and ultimately deſtroyed life, in the month of Auguſt, 1601.

Heurnius had the reputation of great ſagacity in the diſcrimination of diſeaſes, but he was much bigotted to the doctrines and practice of the ancients: he wrote a conſiderable number of books, and was greatly eſteemed in his time. His works are; "Praxis Medicinæ nova Ratio," &c. Leyden, 1587, ſeveral times reprinted. "Oratio de Medicinæ Origine, Æſculapii et Hippocratis ſtirpe et ſcriptis." ibid. 1589. "Inſtitutiones Medicinæ," 1592, which underwent many editions. "De morbis qui in ſingulis partibus humani capitis inſidere conſueverunt," 1594; a very learned performance, and containing ſome important cafes of his own. "De Febribus," 1598. "De Peſte," 1600. "De morbis oculorum, auribus, naſi, dentium, et oris," 1602. "De morbis pectoris." ibid. "De graviſſimis morbis mulierum, & de morbis novis et mirandis," 1607. "De morbis ventriculi," 1608. Beſides theſe, he publiſhed ſeveral works of Hippocrates, with commentaries, and occaſionally with a new verſion, ſome of which were ſeveral times reprinted. All his writings were printed, under the title of "Opera Omnia, tam ad Theoriam, quàm ad Praxim medicam ſpectantia," Lugd. Bat. 1609, in two vols. 4to. and in 1658, folio. Eloy. Dict. Hiſt. Gen. Biog.

HEUSDEN, in *Geography*, a town ſituated on the borders of Brabant and Holland, in the midſt of marſhes, and nearly ſurrounded by a branch of the Meuſe; it is well fortified with a caſtle, baſtion, and horn-works. The juriſdiction of the magiſtrates extends over ſeveral villages, almoſt to Bois-le-Duc; 15 miles N.E. of Breda. N. lat. 51° 45'. E. long. 5°.

HEUST, a town of Pruſſia, on the Friſch Nerung; 17 miles E. of Dantzic.

HEWHOLE, or, as it is pronounced in ſome places, the *high-hoo*, a name given by many to the common green wood-pecker, from its making holes in trees. See PICUS *Viridis*.

HEWSON, WILLIAM, in *Biography*, an eminent anatomiſt, was born at Hexham, in Northumberland, in November 1739. He attended the grammar ſchool of that town until he was apprenticed to his father, a ſurgeon and apothecary of reputation; after which he reſided ſome time with Mr. Lambert, ſurgeon, at Newcaſtle. In 1759 he was ſent to London, and reſided with that diſtinguiſhed anatomiſt, Mr. John Hunter, attending the lectures of his no leſs celebrated brother, Dr. Wm. Hunter. Young Hewſon's aſſiduity and ſkill having attracted the attention of the teachers, he was appointed to ſuperintend the diſſecting room, while Mr. Hunter went abroad with the army in 1760; and in 1762, after ſtudying a year at Edinburgh, he became aſſociated with Dr. Hunter, and occaſionally delivered the anatomical lectures; and when Dr. Hunter's ſpacious eſtabliſhment was completed in Windmill-ſtreet, Mr. Hewſon was allotted an apartment in the houſe. Here he purſued his anatomical inveſtigations, and "his experimental enquiries into the properties of the blood;" an account of which he publiſhed in 1771, and he communicated to the Royal Society ſeveral papers, containing an account of his diſcoveries of the lymphatic ſyſtem in birds and fiſhes, for which he received the Copleyan medal, and was ſoon after elected a fellow of that body. In 1770, his connection with Dr. Hunter was diſſolved, and he began a courſe of anatomical lectures alone in September 1772, in Craven-ſtreet; and publiſhed a ſecond edition of his "Experimental Inquiry," which he dedicated to ſir John Pringle, as a teſtimony of gratitude for the undeviating friendſhip of that illuſtrious phyſician. In the ſpring of 1774, he publiſhed his work on the "Lymphatic ſyſtem." At this time his anatomical theatre was crowded with pupils, his practice was daily increaſing, and his ardour for experimental reſearch undiminiſhed, when he was ſeized with a fever, occaſioned by a wound received in diſſecting a morbid body, which terminated fatally on the 1ſt of May 1774, in the thirty-fifth year of his age. His papers, which were afterwards collected together, were originally publiſhed in the 23d, 24th, 25th, and 28th volumes of the Philoſophical Tranſactions, annis 1768-73. See Tranſactions of the Med. Society of London, vol. i. 1801. —Alſo Hutchinſon, Med. Biog.

HEXACHORD, from the Greek, is a term, in *Muſic*, implying either an inſtrument with ſix ſtrings, or a ſcale of ſix ſounds. In the general ſyſtem, the ſcale of Guido had originally only the Roman literal notation; and it was ſome time after its invention that it was divided into theſe relative hexachords, which were interwoven into each other, and called by theſe ſeveral names: as the *durum* hexachord, from gammut, or G to E: the *naturale* hexachord, from C to A; and the *molle* hexachord, from F to D, in which B is flat. The term hexachord never appears in the Micrologus. See theſe terms ſeverally explained.

The ſyllables ſuppoſed to be taken by Guido from the hymn

hymn to St. John the Baptiſt, "Ut queant laxis reſonare fibris, &c." *Ut re mi fa ſol la*, and being applied to each of theſe hexachords, was to give articulation to ſounds in ſinging, and aſſiſt the ſtudent in hitting diſtances.

And it is from the mixture of theſe hexachords that the mutations in ſolmiſation ariſe. See MUTATION, SOLMISATION, and *Harmonic* HAND.

HEXACHORD, *Major*, or Hexachordon major, is the major, greater, or ſharp ſixth, an interval whoſe ratio is $\frac{1}{5} = 451\,\Sigma + 9f + 39\,m$. See *Major* SIXTH.

HEXACHORD, *Major*, of Galileo, is an interval whoſe ratio is $\frac{16}{27} = 462\,\Sigma + 9f + 40\,m$, and is the *comma redundant major* SIXTH, which ſee.

HEXACHORD, *Minor*, or Hexachordon minor, is the minor, leſſer, or flat ſixth, whoſe ratio is $\frac{5}{8} = 415\,\Sigma + 8f + 36\,m$. See *Minor* SIXTH.

HEXACHORD, *Minor*, of Galileo, is an interval whoſe ratio is $\frac{50}{81} = 426\,\Sigma + 8\,f + 37\,m$, which is the *comma-redundant minor* SIXTH, which ſee.

HEXACHORD, *Minor*, of Didymus, is an interval whoſe ratio is $\frac{81}{125} = 404\,\Sigma + 8f + 35\,m$, which is the *comma-deficient minor* SIXTH, ſee that article.

HEXACONTALITHUS, in *Natural Hiſtory*, the name of a ſtone deſcribed by Pliny, and other of the ancient writers, as being very ſmall, yet ſhewing an almoſt infinite variety of colours. It ſeems only another name for the opal.

HEXADICA, in *Botany*, is derived from ἑξαδικος, relating to the number *ſix*, becauſe this plant has ſix cells in each of its ſeed-veſſels.—Loureir. Cochinch. v. 2. 562.—Claſs and order, *Monœcia Pentandria*. Nat. Ord. *Euphorbiæ*, Juſſ.?

Gen. Ch. Male, *Cal.* Perianth of five, obtuſe, ſhort, ſpreading leaves. *Cor.* Petals five, ovate, concave, ſpreading. *Stam.* Filaments five, ſhorter than the corolla; anthers ovate, two-lobed, erect.

Female, *Cal.* of ſix, obtuſe, very ſhort, perſiſtent leaves. *Cor.* none. *Piſt.* Germen ſuperior, roundiſh; ſtyle none; ſtigmas ſix, concave, cohering together. *Perix.* Capſule globoſe, having ſix valves and ſix cells, with ſolitary, oblong, angulated *ſeeds*.

Eſſ. Ch. Male, Calyx five-cleft. Petals five.

Female, Calyx of ſix leaves. Corolla none. Stigmas ſix. Capſule of ſix cells, ſingle-ſeeded.

1. *H. cochinchinenſis*. *Cay Bùi den* in its native country. Loureir. Cochinch. A native of the woods of Cochinchina.—This is a middling ſized *tree* with ſpreading branches. *Leaves* alternate, ovate-oblong, obtuſe, entire, ſmooth. *Flowers* white, ſmall, faſciculated, nearly terminal. *Capſule* ſmall, blackiſh.

Unknown to us but by Loureiro's deſcription given above. We preſume there is not much doubt reſpecting its being of the natural order we have ſuggeſted.

HEXAEDRON, or HEXAHEDRON, formed of ἑξ, *ſix*, and ἑδρα, *ſeat*, in *Geometry*, one of the five regular bodies, popularly called a cube. See CUBE.

The ſquare of the ſide of a hexaedron is in a ſubtriple ratio to the ſquare of the diameter of the circumſcribed ſphere. Hence, the ſide of the hexaedron is to the diameter of the ſphere in which it is inſcribed, as one to the $\sqrt{3}$: and, conſequently, it is incommenſurable to it.

In general, if A, B, C denote reſpectively the linear ſide, the ſurface, and the ſolidity of a hexaedron or cube, and r the radius of the inſcribed ſphere, and R the radius of the circumſcribed one: we ſhall have the following general equations, expreſſing the relations of the one to the other;

1. $A = 2r = \frac{2}{3} R\sqrt{3} = \sqrt{\frac{1}{6}B} = \sqrt[3]{C}$
2. $B = 24r^2 = 8R^2 = 6A^2 = 6\sqrt[3]{C^2}$
3. $C = 8r^3 = \frac{8}{9} R^3\sqrt{3} = A^3 = \frac{1}{6}B\sqrt{\frac{1}{6}B}$
4. $R = r\sqrt{3} = \frac{1}{2} A\sqrt{3} = \frac{1}{2}\sqrt{\frac{1}{2}B} = \frac{1}{2}\sqrt{3} \times \sqrt[3]{C}$
5. $r = \frac{1}{3} R\sqrt{3} = \frac{1}{2} A = \frac{1}{2}\sqrt{\frac{1}{6}B} = \frac{1}{2}\sqrt[3]{C}$

HEXAGON, formed of ἑξ, *ſix*, and γωνια, *angle*, a figure of ſix ſides and as many angles.

If theſe ſides and angles be equal, it is called a regular hexagon. The angles of a hexagon are each equal to 120 degrees; and the ſide of a hexagon is equal to the radius of a circle circumſcribed about the ſame.

Hence, a regular hexagon is inſcribed in a circle, by ſetting the radius off ſix times upon the periphery.

To deſcribe a hexagon on a given line A B (*Plate* VIII. *Geometry*, *fig.* 97.) draw an equilateral triangle A B C; the vertex C will be the centre of a circle, which will circumſcribe the hexagon required. See POLYGON.

If the ſide of a hexagon be denoted by s, its area will be $= 2.5980762\,s^2 = \frac{3}{2}\,s^1 \times$ tang. $60^\circ = \frac{3}{2}\,s^2\sqrt{3}$. For the reaſon of the rule, ſee POLYGON.

N. B. The reader is here appriſed of an error that occurs under the article DODECAGON, and deſired to transfer the geometrical demonſtration that is introduced under that term to DECAGON, to which it belongs.

HEXAGON, in *Fortification*, is a fortreſs of ſix baſtions.

HEXAGYNIA, in *Botany*, is derived from ἑξ, *ſix*, and γυνη, *a female*, being the name of ſuch orders in the principal claſſes of the Linnæan ſyſtem as are characterized by ſix ſtyles in each flower, or where the ſtyles are wanting, ſix ſeſſile ſtigmas. It is an order which occurs but rarely, though we find *Wendlandia* and *Damaſonium* (both belonging to the claſs *Hexandria*) included under it. The former genus is referred to this order by Schreber, and the latter by Willdenow. In the claſs *Polyandria*, we meet with an elegant aquatic, *Stratiotes*, or Water Soldier, included in *Hexagynia*, as well as with *Braſenia*, a new genus of Schreber's. It does not appear in any other of the Linnæan claſſes, except *Enneandria*, where it is eſtabliſhed to admit *Butomus*, the FloweringRuſh.

HEXAHEDROSTYLA, in *Natural Hiſtory*, the name of a genus of ſpars.

The word is derived of the Greek ἑξ, *ſix*, ἑδρα, ſide, and στυλος, *a column*.

The bodies of this genus are ſpars of a columnar form, adhering to ſome ſolid body at the baſe, and terminated at the point by a pyramid. The pyramid and column are both hexahedral, or compoſed each of ſix ſides.

Of this genus there are three known ſpecies. 1. A ſlender one with a long pyramid, compoſed of ſo pure and clear a ſpar, that it reſembles cryſtal, and is found in Ockley Hole, on Mendip hills, and in ſome other parts of England. 2. A ſomewhat thick one, with a long irregular pyramid, found in the mines of Cornwall and Devonſhire, and common alſo in thoſe of Germany. 3. One with a very ſhort pyramid found in the Derbyſhire lead-mines, and in thoſe of the Hartz-foreſt in Germany. Hill's Hiſt. of Foſſils, p. 218.

HEXAMERON, or HEXÆMERON, a name given to divers writings, both of ancient and modern authors, containing commentaries, or diſcourſes, on the firſt chapter of Geneſis;

Geneſis; wherein is delivered the hiſtory of the creation or the firſt ſix days of the world.

The word is Greek, formed of ἑξαμερον, or ἑξαημερον; compoſed of ἑξ, *ſex, ſix*, and ἡμερα, which in the Doric dialect is wrote ἁμερα, *day*.

St. Baſil, St. Ambroſe, &c. have wrote *Hexamerons*.

HEXAMETER, compoſed of ἑξ, *ſix*, and μετρον, *meaſure, foot*, in the *Ancient Poetry*, a verſe uſed by Greek and Latin writers, conſiſting of ſix feet.

The firſt four feet of an hexameter may be indifferently either dactyls, or ſpondees: but the laſt foot, in ſtrictneſs, is always to be a ſpondee, and the laſt but one a dactyl. Such is that of Homer

Εις ὑδωρ μ' ερριψας, εχεν Θεος εκδικον ομμα.

And that of Virgil.

"Diſcite juſtitiam moniti, & non temnere divos."

Hexameter verſes are divided into *heroic*, which are to be grave and majeſtical, ſuitable to the dignity of heroic poetry; and *ſatirical*, which may be more looſe and negligent; as thoſe of the epiſtles of Horace.

Epic poems, as the Iliad, Odyſſey, Æneid, &c. conſiſt of hexameter verſes alone; elegies and epiſtles ordinarily conſiſt, alternately, of hexameters and pentameters.

Some of the French and Engliſh poets have attempted to compoſe in hexameter verſes, but without ſucceſs. Jodelle made the firſt eſſay in 1553, with a diſtich in praiſe of Oliver de Magny, which Paſquier repreſents as a maſterpiece. It is this:

"Phœbus, Amour, Cypris, veut ſauver, nourrir & orner
Ton vers, & ton chef, d'umbre, de flamme, de fleurs."

But this kind of poetry pleaſes nobody. The modern languages are not at all fit for a kind of verſe whoſe cadence depends altogether on long and ſhort ſyllables.

HEXAMILA, in *Geography*, a town of European Turkey, in Romania, on the coaſt of the Helleſpont, anciently called Lyſimachia; 12 miles S. of Gallipoli.

HEXAMILION, Hexamili, or Hexamilium, in *Antiquity*, a celebrated wall, built by the emperor Emanuel, in 1413, over the iſthmus of Corinth.

It took its name from ἑξ, *ſix*, and μιλιον, which in the vulgar Greek ſignifies a *mile*; as being ſix miles long.

The deſign of the hexamilion was to defend Peloponneſus from the incurſions of the Barbarians. Amurath II. having raiſed the ſiege of Conſtantinople in the year 1424, demoliſhed the hexamilion; though he had before concluded a peace with the Greek emperor.

The Venetians reſtored it in the year 1493, by 30,000 workmen, employed for 15 days, and covered by an army commanded by Bertoldo d'Eſte, general of the land-forces; and Louis Loredano, commander of the ſea.

The infidels made ſeveral attempts upon it, but were repulſed, and obliged to retire from the neighbourhood thereof; but Bertoldo being killed at the ſiege of Corinth, which was attempted ſoon after, Bertino Calcinato, who took on him the command of the army, abandoned, upon the approach of the beglerberg, both the ſiege and the defence of the wall, which had coſt them ſo dear; upon which it was finally demoliſhed.

HEXANDRIA, in *Botany*, is derived from ἑξ, *ſix*, and ανηρ, ανδρος, *a man*. It forms the ſixth claſs of the ſexual or artificial ſyſtem of Linnæus, and conſiſts of ſuch plants as have ſix ſeparate or diſtinct ſtamens in the ſame flower with the piſtil or piſtils, no regard being had to proportion. It includes ſix orders; *Monogynia*, containing the Liliaceous tribe of plants, called by Linnæus the nobles of the vegetable kingdom, and which indeed may be conſidered as one of its more ſplendid ornaments. The beautiful white Lily, lately made known to us as a native of the vale of Tempe (ſee Sm. Prod. Fl. Græc. p. 2. 227.), and which is ſo univerſally admired, may be adduced as an inſtance. The well-known genera of *Juncus*, or Ruſh, and *Allium*, or Onion, belong alſo to this order, and indeed the former of theſe, though ſo unoſtentatious in its appearance, is more nearly allied to the Lily than its firſt aſpect would induce an unexperienced botaniſt to ſuppoſe; *Digynia* contains the valuable *Oryza*, Rice, a grais curious for its having ſix ſtamens; *Trigynia* includes the extenſive genus of *Rumex*, or Dock, as well as *Toſieldia*, Scottiſh Aſphodel, and *Colchicum*, or Meadow Saffron; *Tetragynia* conſiſts of *Petiveria alliacea* only; *Hexagynia* of *Wendlandia* and *Damaſonium*, which latter genus comprehends *Stratiotes aliſmoides* of Linnæus; and laſtly *Polygynia* merely depends on *Aliſma*, the Water Plantain.

Hexandria is alſo an order in ſuch of the Linnæan claſſes as are not founded on the number of ſtamens. In *Diadelphia* it includes the beautiful genus *Fumaria*, and alſo the little known *Saraca*. In *Gynandria* this order contains *Ariſtolochia*, and in each of the claſſes *Monœcia* and *Diœcia* we meet with a few genera under the order *Hexandria*.

HEXANTHUS, from ἑξ, *ſix*, and ανθος, *a flower*, becauſe there are ſix flowers in one common calyx. Lour. Cochinch. 195. This is the *Tetranthera ferruginea*, Brown. Prodr. Nov. Holl. vol. i. 403, as appears by a ſpecimen ſent by the author to ſir Joſeph Banks. See Tetranthera.

It is a *tree*, growing wild on the mountains of Cochinchina, where it is called *Cây Ngât*, and the wood uſed for building. The *leaves* are ovate, oblong, pointed, entire, alternate, large. *Flowers* greeniſh white, in ſmall axillary umbels.

HEXAPETALON, in *Natural Hiſtory*, the name of a ſpecies of foſſil plants, found in the coal meaſures of the foreſt of Dean, in Glouceſterſhire, which are figured and deſcribed in the Phil. Tranſ. Abr. by Lowthorp, vol. v. p. 121.

HEXAPLA, formed of ἑξ, *ſix*, and απλοω, *I open, or unfold*, in *Church Hiſtory*, a bible diſpoſed in ſix columns; containing the text, and divers verſions thereof, compiled and publiſhed by Origen, with a view of ſecuring the ſacred text from future corruptions, and to correct thoſe that had been already introduced.

Euſebius, Hiſt. Eccl. lib. vi. cap. 16. relates, that Origen, after his return from Rome under Caracalla, applied himſelf to learn Hebrew, and began to collect the ſeveral verſions that had been made of the ſacred writings, and of theſe to compoſe his Tetrapla and Hexapla: others, however, will not allow him to have begun till the time of Alexander, after he had retired into Paleſtine, about the year 231.

To conceive what this Hexapla was, it muſt be obſerved that, beſides the tranſlation of the ſacred writings, called the Septuagint, made under Ptolemy Philadelphus, above 280 years before Chriſt, the ſcripture had been ſince tranſlated into Greek by other interpreters. The firſt of thoſe verſions, or (reckoning the Septuagint) the ſecond was that of Aquila, a proſelyte Jew, the firſt edition of which he publiſhed in the twelfth year of the emperor Adrian, or about the year of Chriſt 128; the third was that of Symmachus, publiſhed, as is commonly ſuppoſed, under Marcus Aurelius, but, as ſome ſay, under Septimius Severus, about the year 200; the fourth was that

of Theodotion, prior to that of Symmachus, under Commodus, or about the year 175: these Greek versions, says Dr. Kennicott, were made by the Jews from their corrupted copies of the Hebrew, and were designed to stand in the place of the Seventy, against which they were prejudiced, because it seemed to favour the Christians. The fifth was found at Jericho, in the reign of Caracalla, about the year 217; and the sixth was discovered at Nicopolis, in the reign of Alexander Severus, about the year 228: lastly, Origen himself recovered part of a seventh, containing only the Psalms.

Now Origen, who had held frequent disputations with the Jews in Egypt and Palestine, observing that they always objected against those passages of scripture quoted against them, and appealed to the Hebrew text; the better to vindicate those passages, and confound the Jews, by shewing that the Seventy had given the sense of the Hebrew, or rather, to shew, by a number of different versions, what the real sense of the Hebrew was, undertook to reduce all these several versions into a body, along with the Hebrew text, so as they might be easily confronted, and afford a mutual light to each other.

He made the Hebrew text his standard; and allowing that corruptions might have happened, and that the old Hebrew copies might and did read differently, he contented himself with marking such words or sentences as were not in his Hebrew text, nor the later Greek versions, and to add such words or sentences as were omitted in the Seventy, prefixing an asterisk to the additions, and an obelisk to the others.

In order to this he made choice of eight columns: in the first he gave the Hebrew text in Hebrew characters; in the second, the same text in Greek characters; the rest were filled with the several versions above mentioned; all the columns answering verse for verse, and phrase for phrase; and in the psalms there was a ninth column for the seventh version.

This work Origen called Ἑξαπλα, *Hexapla, q. d. sextuple*, or a work of six columns, as only regarding the first six Greek versions. See TETRAPLA.

Indeed, St. Epiphanius, taking in likewise the two columns of the text, calls the work Octapla, as consisting of eight volumes.

This celebrated work, which Montfaucon imagines consisted of fifty large volumes, perished long ago, probably with the library at Cæsarea, where it was preserved, in the year 653; though several of the ancient writers have preserved us pieces thereof, particularly St. Chrysostom on the Psalms, Philoponus in his Hexameron, &c. Some modern writers have earnestly endeavoured to collect fragments of the Hexapla, particularly Flaminius Nobilius, Drusius, and F. Montfaucon, in two folio volumes, printed at Paris in 1713. In his edition, Montfaucon has prefixed Prolegomena, explaining the form and detailing the history of the Hexapla.

HEXAPOD, of ἕξ, and πόδες, in *Zoology*, an animal with six feet.

HEXAPYRAMIDES, in *Natural History*, the name of a genus of spars.

The word is derived from the Greek ἕξ, *six*, and πυραμις, *a pyramid*.

The bodies of this genus are spars formed into pyramids, composed of six sides or planes, and affixed to no column, but adhering to some solid body by their bases. Of this genus, there are only two known species: 1. A short one with a broad base, which is very rare, and found only in the great mine at Gosselar in Saxony. And, 2. A long-pointed one, with a narrow base; this is found in the fissures of the alabaster quarries of the Hartz-forest. Hill's Hist. of Foss. p. 225.

HEXARMONIAN, in the *Ancient Music*, a nome, or song, in an effeminate and languid style, of which Aristophanes accused its author.

HEXASTYLE, composed of ἕξ, *six*, and στυλος, *column*, in the *Ancient Architecture*, a building with six columns in front.

The temple of Honour and Virtue at Rome, built by Mutius, was a hexastyle.

HEXHAM, in *Geography*, a market-town and parish in the ward of Tynedale, and county of Northumberland, in England, is seated at the confluence of the rivers North and South Tyne. In the year 1800, the town and its suburbs consisted of 732 houses, and contained 4565 inhabitants. This parish consists of five townships, and was ranked as a county-palatine till the 33d year of Henry VIII. It is 23 miles W. by N. from Newcastle, and has a petty sessions. Anciently it was a manor belonging to the see of York, whose prelates were invested with great regalities and powers within the jurisdiction of this manor. The liberties were affirmed to them by the king's council in parliament, in the 21st year of Edward I., and again by a clause in the 13th of Edward III. Horsley, in his Britannia Romana, has given views of some inscribed stones, which are referred to the Anglo-Romans. One of the inscriptions records the name of the emperor Lucius Septimius Severus. Horsley conjectures that this place was the Roman station mentioned by Ptolemy under the name of Epiacum. Respecting its history during the Saxon dynasty, we have more certain evidence: for this, with parts of the adjacent country, were parcels of the crown lands of the kings of Northumbria, and were settled by king Egfrid on his queen Etheldreda. The same monarch also founded a bishopric here in 674: and Wilfrid, it's first bishop, is said by ancient writers to have built a magnificent cathedral church. This structure is described by Eddius, in his life of Wilfrid, to have had columns, ornamental carvings, oratories, crypts, &c. It is also related that the bishop procured artists from various parts of Europe, to build and decorate it. This building, however, was destroyed by the Danes about the year 821. Another stately church, however, was erected in the time of Henry I., part of which still remains, and displays some interesting examples of ancient architecture. It also contains some curious tombs; among which is one attributed to Alfwald I., king of Northumberland, who was assassinated in 788. In the choir is a beautiful oratory. This church had the privilege of sanctuary, which was also extended a mile from it to the east, west, north, and south. At each extremity was a stone cross. Pennant describes part of the ancient monastery and church as remaining when he visited Hexham in his journey to Scotland. He also mentions a fridstol, or stool-of-peace, as preserved here. The town-house is described by the same author as built over an ancient gate, beyond which is an old square tower of three stories. The streets of Hexham are narrow and inconvenient. In the vicinity of this town was fought a memorable battle between the Lancastrians and Yorkists in 1463, when the former were defeated. The monarch fled for life and safety, and his queen, with the infant prince, fought refuge in a neighbouring forest. Here she was assailed and plundered by a banditti; but afterwards made her escape. Pennant's Tour in Scotland, 4to. vol. iii. Hutchinson's History, &c. of Northumberland, 2 vols. 4to.

HEXIS, in the *Writings of the Greek Physicians*, a word used to express a firm and permanent habitude, in opposition

to ſchefis and diatheſis, importing a tranſient or eaſily removed diſpoſition.

HEXODON, in *Entomology*, a genus of *Coleoptera*, eſtabliſhed by Olivier. See SCARABÆUS.

HEYBACH, or HEUBACH, in *Geography*, a town of Germany, in the county of Wertheim, on the Mayn; 5 miles W. of Freudenberg.

HEYDE, a town of Holſtein, about 8 miles from the coaſt; 50 miles S.S.W. of Sleſwick.

HEYDECK, a town of Bavaria, in the principality of Neuburg; 22 miles N. of Neuburg.

HEYDEN, SEBALDUS, in *Biography*, author of a ſmall elementary muſical tract in Latin, publiſhed at Nuremberg in 1537; which extends not to compoſition, pretending nothing more than to teach the mere characters and their value, as a rudiment for reading muſic.

HEYDEN, JOHN VANDER, an extraordinary painter of views of churches, palaces, &c., who was born at Gorcum in 1637. He firſt practiſed the art under the directions of a painter on glaſs of no great diſtinction, but he was led by his own taſte to the amazing excellence he obtained in his line of practice; in which he imitated the objects he choſe with the greateſt truth and preciſion. His pictures are finiſhed with inexpreſſible neatneſs, and muſt have required the moſt wonderful degree of patience, as he repreſented buildings ſo minutely exact, that the bricks or ſtones employed in their conſtruction may be counted. Yet notwithſtanding this, he preſerved great breadth of maſs in his lights and ſhadows, and perfect union and harmony in his colouring. Sir Joſhua Reynolds ſays of him, and juſtly, that ſuch is the truth of imitation in his works, that they have very much the effect of nature ſeen in a camera-ſcuro.

Many of the Flemiſh painters have equal'ed Vander Heyden in neatneſs of finiſh, but very few of them have poſſeſſed the art of uniting mellowneſs with it. Nothing in his paintings appears laboured or ſervile; nothing hard, ſtiff, or dry; but the more minutely and critically we examine them, the more we are aſtoniſhed to obſerve the taſte and conduct viſible through the whole.

He painted for a while in London. In many of his pictures of Amſterdam, Delft, &c. the figures, which are ſometimes numerous, were introduced by A. Van de Velde, which judicious conduct of uniting ſuch able talents to his own, in matters of which he was not well informed himſelf, adds a great additional value to his pictures; which never fail of purchaſers at conſiderable prices. He died in 1712, at the age of 75.

HEYDT, JOHN WOLFGANG, an architect of ſome celebrity, is mentioned in this dictionary on account of a work giving "A true Repreſentation of the principal Countries, Coaſts, and Iſlands belonging to the Dutch Eaſt India Company, in accurate Maps and Charts, with the Towns, Harbours, Forts, Factories, Caſtles, Wharfs, Store-houſes, Churches, and other public Buildings." To this he gave an appendix, or hiſtorical deſcription of his own voyage from Holland to the Eaſt Indies, and thence back to his native country, with a complete index, and 115 drawings, executed on the ſpot chiefly by himſelf. This beautiful work was printed at the author's own expence, and ſcarcely obtained what may be called a publication; it is of courſe very little known, but highly prized by thoſe who have had acceſs to it. Gen. Biog.

HEYLANUS, PETRUS, a Netherlander, and a muſical compoſer of ſongs to French words. In the third book of the Louvain collection of ſongs in the Britiſh Muſeum, in four parts, there is one by Heylanus, of ſuch ſingular merit, that this author muſt have compoſed but little, or been very unjuſtly treated by poſterity; as we find his name no where elſe. The points of imitation in this ſong, though airy and familiar, are brought in almoſt as cloſely and conſtantly as if in perpetual canon; indeed, it would not be eaſy to find a compoſition in which more art is diſcovered, with ſuch ſeeming facility. Had we room in our plates for ſpecimens of compoſition, we ſhould gladly inſert this ſong, as a curioſity, for melody and cloſe imitation during the 16th century.

HEYLYN, PETER, a learned divine, born at Burford, in Oxfordſhire, in the year 1600. He was inſtructed in grammar-learning in the free-ſchool of that place, and when he was only thirteen years of age he entered Hart-hall, now Hertford college, in the univerſity of Oxford: he afterwards obtained a fellowſhip at Magdalen college, where he read coſmographical lectures, and in 1621 he publiſhed a "Deſcription of the World," which he afterwards enlarged, under the title of "Coſmography in Four Books, containing the Geography and Hiſtory of the whole World, and all the principal Kingdoms, Provinces, Seas, and Iſles thereof." In 1623, Mr. Heylyn was admitted to holy orders, and in 1625 he made a ſhort tour on the continent, of which he publiſhed an account thirty years afterwards. In 1628 he was appointed chaplain in ordinary to the king, and in 1631 he obtained a prebend of Weſtminſter, which was followed by the living of Houghton, in the dioceſe of Durham. In 1633 he took the degree of doctor of divinity, and ſhortly after obtained more preferment, chiefly by the influence of archbiſhop Laud, of which he was afterwards deprived by the parliament, and being voted a delinquent, his goods were confiſcated, and his perſon endangered. He would now have been reduced to great diſtreſs, if the king had not employed him to write a periodical paper, which was publiſhed weekly at Oxford, under the title of "Mercurius Aulicus," by which, for ſome time, he gained a ſcanty ſubſiſtence. In 1645, when the affairs of Charles became deſperate, Dr. Heylyn, who was his ſteady adherent, quitted Oxford, and wandered about from place to place, ſuffering in himſelf and his family, from the extreme preſſure of his circumſtances. At the reſtoration, he was put in poſſeſſion of his former preferment, and obtained alſo the ſub-deanery of Weſtminſter: this he conſidered as a very inadequate recompence for the ſupport which he had given to the cauſe of the late king, and for the ſufferings which he had undergone in defence of his principles. He died in 1662, a diſappointed man. He was author of numerous works; was a man of conſiderable learning and induſtry, but a partial and bigotted writer; a zealous defender of civil and eccleſiaſtical tyranny, and exceedingly acrimonious againſt thoſe who differed from him. Biog. Brit.

HEYRIEU, in *Geography*, a town of France, in the department of the Iſère, and chief place of a canton, in the diſtrict of Vienne; 1 miles N.E. of Vienne. The place contains 1338, and the canton 9453 inhabitants, on a territory of 195 kiliometres, in 11 communes.

HEYRS, in *Huſbandry*, young timber-trees, uſually left for ſtandards in felli g of wood or copſes.

HEY-SAN, or BLACK ISLANDS, in *Geography*, a cluſter of iſlands near the coaſt of China, little better than naked rocks. N. lat. 28 53'. E. long. 124.

HEYST-OP-DEN-BERG, a town of France, in the department of the Two Nethes, and chief place of a canton, in the diſtrict of Malines. The place contains 2831, and the canton 8579 inhabitants, on a territory of 90 ki iometres, in 8 communes.

H I A

HEYTESBURY. See HEITSBURY.

HEYWOOD, JOHN, in *Biography*, an Engliſh poet, was born in London, and educated at Oxford. He is mentioned as one who firſt wrote plays in our language, and is ſaid to have been exceedingly ſkilled in muſic. He was a great favourite with Henry VIII. and queen Mary, but on the acceſſion of queen Elizabeth he went to Mechlin, where he died in 1565. His principal performance is entitled the "Spider and Fly, a Parable," publiſhed in 4to. His ſon, Ellis Heywood, became a Jeſuit, wrote a book in the Italian language entitled "Il Moro," and died at Louvain in 1572.

HEZAREE, in *Geography*, a river of India, the ſame with that of Cabul, or the Kameh.

HHAHB, in *Modern Hiſtory*, is a name which the Mahometans give to one of the officers of their moſques, anſwering to our curates.

HIA-LOUI, in *Geography*, a city of China, of the ſecond rank, in Quang-ſi. N. lat. 22° 54'. E. long. 106° 19'.

HIAM-HO, a town of China, of the third rank, in Petche-li; 26 miles E. S. E. of Peking.

HIANG-NING, a town of China, of the third rank, in Chan-ſi; 37 miles W. of Pin-yang.

HIANG-OU, a city of China, of the ſecond rank, in Quang-ſi. N. lat. 23° 10'. E. long. 106° 26'.

HIAO-FONG, a town of China, of the third rank, in Tche-kiang; 10 miles S. S. W. of Ngan-ki.

HIAO-Y, a town of China, of the third rank, in Chan-ſi; 10 miles E. of Fuen-tcheou.

HIAO-KANG, a town of China, of the third rank, in Hou-quang; 25 miles S. S. W. of Te-nghan.

HIA-PETIE, a town of Chineſe-Tartary. N. lat. 40° 48'. E. long. 117° 38'.

HIA-QUI, a province of New Mexico, between Mayo (now Oſtimuri) and Sonora, which is conſidered by ſome as a diſtrict of New Navarre: it derives its name from that of the river which waters it. Its chief town is Riochico.—Alſo, a river of New Mexico, which is a large and fertile ſtream, dividing Sonora from Cinaloa, and inundating the neighbouring provinces of Sonora and Oſtimuri. Riſing in the extenſive province of Tauramara, it leaves or pervades the grand chain of mountains, running about half its courſe towards the N. W. After which it purſues the remainder towards the S. W., entering the gulf of California at the village of Huiribis, where is a ſecure harbour, the neareſt to California, and whence proviſions are generally conveyed to that peninſula. The banks produce abundant harveſts of maize, French beans, a kind of peas, and lentiles.

HIARNOE, a ſmall iſland of Denmark, near the E. coaſt of Jutland, at the mouth of the gulf of Horſens. N. lat. 55° 50'. E. long. 10° 5'.

HIASTAOTOMTEHOM, a Chineſe name, expreſſing a plant, the root of which is ſaid to change, at a certain time, into a worm. M. Reaumur has given it the name of *plante ver* in the French, but he has diſcovered the error of ſuppoſing ſuch a transformation: the whole truth of the caſe being, that a certain caterpillar, when about to change into the chryſalis ſtate, ſo nicely joins itſelf to the root of this plant, as to appear a part of it.

HIAT, in *Geography*, a country of Africa, ſituated on the S. of Fezzan.

HIATCHE, a city of China, of the ſecond rank, in Quang-ſi. N. lat. 22° 10'. E. long. 106° 20'.

HIA-TEIN, a town China, of the third rank, in Chang-tong; 11 miles W. N. W. of Cao-tang.

HIATICULA, in *Ornithology*, the ſea-lark. See CHARADRIUS *Hiaticula*.

HIA-TIEN, in *Geography*, a town of China in Petche-li, ſaid to contain 80,000 inhabitants; 25 miles E. of Peking.

HIATSTOWN, a town of America, in Middleſex county, New Jerſey; 17 miles S. W. from Brunſwick.

HIATULA, in *Ichthyology*. See LABRUS *Hiatula*.

HIATULA is alſo a name by which Gaza, and ſome other authors, have called the ſhell-fiſh more uſually named *Chama*; a genus diſtinguiſhed from other kinds by its always keeping its ſhells in ſome degree open, and in many ſpecies having no power to ſhut them entirely; for this reaſon they defend their naked bodies by burying themſelves in the mud, or in other ſubſtances.

HIATUS, a Latin term, properly ſignifying the aperture of the mouth, from the verb *hiare, to gape*.

It is variouſly uſed, in works of literature, &c. to denote a *chaſm* or *gap*; particularly in verſes, where there is a claſhing of vowels, by one word ending with a vowel, and the following one beginning with another:

As in—"Tho' oft the ear the open vowels tire."

This claſhing of vowels, ſo diſagreeable to the ear, is called a hiatus in proſe as well as verſe. The Romans were ſo very careful to avoid it, that they always ſuppreſſed the preceding vowel even in proſe; as it is obſerved by Cicero in his Orator. In writing, to avoid it, they uſed to inſert the letter *d*: as in *redeo, redamo, mederga*, &c. Hence, on the baſe of the Duilian column, we meet with *prædad. altod. marid.* &c. Voſſ.

HIATUS is alſo uſed for a defect in a manuſcript copy, where ſomething is loſt or effaced by the injuries of time or otherwiſe.

In a theatrical piece, there is ſaid to be a hiatus, when a ſcene is not well connected to the next, but leaves the action interrupted, and the ſtage empty.

In matters of genealogy, hiatus is an interruption in a line or ſeries of deſcendants.

HIATUS, in *Geology*, is a term uſed by Dr. Woodward, "Nat. Hiſt. of the Earth," p. 117. 135. 137, &c. to denote the vaſt fiſſures and chaſms, which, according to his theory, were opened by the earthquakes which preceded the Noachian deluge, and through which the waters of his ſubterranean abyſs were forced up, by the preſſure of elaſtic fluids generated by central fires. Mr. Whitehurſt, in his "Enquiry concerning the Earth," 2d edit. p. 189. ſuppoſes ſimilar fiſſures, which he calls gulfs, to have occupied the bottom of each valley, and into which the matter excavated to widen the vale above was tumbled, and filled up theſe gulfs, ſome of which he ſuppoſes may have been "many hundreds of miles deep." M. De Luc, § 284, of his "Treatiſe on Geology," has recourſe to ſimilar openings or intervals between the maſſes of ſtrata, which, according to his theory, by their ſubſidence and angular motion formed the vallies. The recent and minute examination of Derbyſhire and its environs, by Mr. Farey, (ſee his Report on Derbyſhire,) ſhews, beyond the poſſibility of doubt, that the bottoms of the many vallies in that diſtrict are whole and unbroken, and that the hiati of Whitehurſt or De Luc are alike wanting in the vallies of that diſtrict; and that the valley at Matlock Tor, in particular, which Mr. W. had explained by the ſubſidence and angular motions of the ſtrata, exactly on M. De Luc's principles, was not ſo occaſioned, is ſhewn by a new and accurate ſection acroſs it, in the Philoſophical Magazine, vol. 31. p. 36.

HIBBERTIA,

HIBBERTIA, in *Botany*, named in honour of George Hibbert, esq., M. P. F. L. S., a gentleman eminently distinguished for his love of plants and the liberality of his communications, who purchased the entire herbarium of the late professor Murray of Göttingen, and for some time maintained an able collector at the Cape of Good Hope, for the purpose of enriching his garden with living plants; as well as his herbarium, and those of his friends, with dried specimens. Andr. Repos. t. 126. Salis. Parad. 73. (Candollea; Billard. Nov. Holl. v. 2. 33.)—Class and order, *Polyandria Pentagynia*. Nat. Ord. *Multisiliquæ*, Linn. *Ranunculaceæ*, Juss. *Dilleneæ*, Salis.

Gen. Ch. *Cal.* Perianth inferior, of five equal, coriaceous, ovate, permanent leaves. *Cor.* Petals five, roundish, obtuse, with broadish claws, deciduous. *Stam.* Filaments numerous, sometimes partially combined, much shorter than the corolla; anthers vertical, erect, oblong, of two parallel cells, bursting at the edges. *Pist.* Germens superior, five or ten, sometimes more, sessile, ovate; styles one to each germen, terminal, cylindrical, spreading; stigma obtuse. *Peric.* Capsules five to ten, occasionally more or fewer, distinct, ovate, somewhat triangular, of one cell. *Seeds* several, roundish, each in a fleshy tunic, bursting at the top.

Ess. Ch. Calyx inferior, of five coriaceous permanent leaves. Petals five, deciduous. Nectaries none. Capsules several, ovate, of one cell. Seeds several, tunicated.

1. H. *volubilis*. Andr. Repos. t. 126. (Dillenia volubilis; Venten. Choix de Plantes, t. 11. D. scandens; Willd. Sp. Pl. v. 2. 1251. D. speciosa; Curt. Mag. t. 449.)—Stem twining. Leaves obovate, acute, nearly entire.—Native of the country about Port Jackson, New South Wales, from whence seeds were brought soon after the establishment of the colony there, and plants raised, according to Messrs. Lee and Kennedy, in several gardens about London in 1792. Mr. Andrews published it in 1800; so that the name he has given takes precedence of the otherwise highly eligible *Candollea* of La Billardiere, not published till 1806. This is a hardy green-house plant, of rapid growth, blossoming from May to September, and readily encreased by cuttings, delighting in a light sandy peat soil. The *stem* is shrubby, twining, three or four feet high, branched, mostly downy. *Leaves* scattered, on short stalks, recurved, two or three inches long, simple, obovate, acute, convex; smooth and dark green above, pale and silky beneath; their edges either entire or slightly toothed. *Stipulas* none. *Flowers* terminating the shorter branches, solitary, nearly sessile, two inches wide, bright yellow, with an extremely disagreeable smell like that of the nauseous *Adæa racemosa*. *Calyx* fringed. *Germens* and *styles* five.

2. H. *cuneiformis*. (Candollea cuneiformis; Billard. Nov. Holl. v. 2. 34. t. 176.)—Stem erect, shrubby. Leaves wedge-shaped, smooth, nearly entire. Petals shorter than the calyx.—Native of Van Lewin's Land, on the south coast of New Holland. *Stem* shrubby, eight or nine feet high, erect, much branched. *Leaves* about an inch and half long, wedge-shaped, sometimes obscurely lobed or wavy at the end. *Flowers* not half so large as the former, their petals much shorter than the calyx. *Filaments* united into five parcels, opposite to the petals. *Germens* and *styles* five. *Seeds* two in each capsule.

3. H. *crenata*. Andr. Repos. t. 472. (Burtonia grossularifolia; Salis. Parad. t. 73, the page subsequently changed for one with the name of *Hibbertia grossularifolia*, but we much prefer the original appellation, *crenata*, Curt. Mag. t. 1218.)—Stem decumbent. Leaves roundish, notched. Flower-stalks elongated.—Native of the west coast of New Holland, near King George's Sound. *Stem* trailing, much branched, hairy, a foot or two in length, scarcely shrubby. *Leaves* recurved, roundish-obovate, stalked, strongly crenate, somewhat plaited, paler beneath, about an inch long. *Flower-stalks* twice or thrice that length, hairy, reddish. *Flowers* the size, colour, and appearance of those of *Potentilla fruticosa*, with a slight protuberance under the calyx, on which Mr. Salisbury founded his genus *Burtonia*, but he has since justly corrected that opinion.

4. H. *angustifolia*. Salis. n. 4. (Dillenia procumbens; Billard. Nov. Holl. v. 2. 16. t. 156.)—Stem decumbent. Leaves linear-lanceolate, entire.—Gathered by La Billardiere in Van Diemen's Land. The numerous *stems* are rather shrubby, spreading on the ground to the extent of a foot, and are branched, bearing numerous smooth, sessile, thickish, narrow, lanceolate, acute *leaves*, not an inch long. *Flowers* solitary, terminal, sessile, smaller than the last, their petals round, equal to the calyx. *Stamens* all separate. *Styles* five.

The most remarkable circumstance in the botanical history of this genus, is Mr. Curtis's mistaking the first species for *Dillenia indica* of Linnæus, D. *speciosa* of Thunberg, and of Sm. Exot. Bot. t. 2, 3, though he actually quotes the *Syalita* of Hort. Malab. v. 3. t. 38, 39, which is strikingly different. This is so unlike his usual correctness, that we presume he did not turn to the book.

HIBE, in *Geography*, a town of Hungary; 16 miles N.E. of Rosenburg.

END OF VOL. XVII.

Strahan and Preston,
New-Street-Square, London.
